Senator Walsh—Is it not a practical notice to every employe that the officials of the company do not recognize and do not want unions in their establishments?

Mr. Gary.—Well, I cannot concede that, senator, although I will concede that it is notice to the men that we do not contract with them.

Senator Walsh.—Yet you say that they have a right to unionize.

Mr. Gary.—Of course they have.

Senator Walsh.—What good is there in unionizing if their leaders or representatives cannot talk with their employers?

Mr. Gary.—I do not think the leader should undertake to talk with the employers of a few of the men in a shop when they know in advance that no contracts are made with the union labor leaders, and especially when the men themselves are not requesting it.

Senator Walsh—It is evident, Judge Gary, that 40 per cent of your men were interested, when they obeyed these men and went out on a strike afterwards, or some part of the 40 per cent that did go on strike.

Mr. Gary—In that way, yes.

Senator Wolcott—You recognize the wisdom and the reasonableness of affording recognition to the spokesmen of the men who are themselves working in the mill?

Mr. Gary—Yes, if a committee from any particular department, any one of them, desired to confer with any of our people in regard to any matters in the mills, they are welcome, regardless of the question as to whether they belong to the unions or not; but in this case, these union leaders were entirely outside men who were trying to organize the mills which were not organized when they had not been requested by the men to do so. They had nothing whatever to do with our business or our affairs, any more than a man would have to interfere with the—

Senator Walsh (interrupting)—But, Judge Gary, if they had nothing to do with your business or with your affairs, how could they have gotten the men to follow them?

Mr. Gary—I think about 10 per cent, possibly 15 per cent, have joined the union after a long campaign, and very many influences were resorted to in order to get them to sign up, and they called out all of the employes. That was a part of the plan to organize the mills, which they had not been able to do otherwise. They would not wait at the President's request because they were afraid if they did that they would all go out—I believe that has been stated and I believe that is true. When they were called out, of course, the 10 per cent or 15 per cent, if there was more than 10 per cent, would go out senator; of course, they would go out or else they would have to leave the union. When they went out and began their intimidation and all that sort of thing, a large number of other men stayed away and remained at home. That was a part of the plan. They expected that.

The Chairman—If this committee that came to see you had been composed of men who were actually working in your mills, even though they had been union men, would you have received them and talked with them, Mr. Gary?

Mr. Gary—Yes, unless they came specifically as union leaders and I do not know whether I would then or not. But they did not come that way and therefore I do not have to decide that question. It has not come up. However, let me say this, senator, if you will allow me, that if a committee had come to me and stated that they were dissatisfied with the subsidiary company's treatment and asked permission to see me and to present any matters whatsoever, I would not have inquired whether they belonged to any union or not. That would have been immaterial, entirely immaterial, if they would come as workmen from the mills.

Senator Borah—I saw a statement published in a paper in which you stated that you could not arbitrate this matter because of moral questions involved.

Mr. Gary—Well, Senator, the fundamental issue, as I conceive it, is the question of an open shop or a closed shop, the question of allowing a man to work where he pleases, whether he belongs to a union or not, and the right of the employer to employ a man in his shop, whether the man is a union man or not.

I believe that it is well known all over the world and is the opinion of a large majority of the people of the world that the open shop is essential to progress and prosperity,

Head of Senate Body Agrees with Gary

DURING the examination of Judge Gary, Senator Kenyon, chairman of senate committee on education and labor, conducting the senate's inquiry into the steel strike, agreed with the chairman of the United States Steel Corp., that the closed shop is undesirable from the standpoint of the country's welfare.

Judge Gary preferred not to answer a question as to whether President Wilson had asked him to confer with the trade union leaders, suggesting that he considered what transpired between him and the President a private matter unless the President should be willing to disclose the information. The following conversation then ensued:

The Chairman—Do you think that a question of strike in industries that affect two or three hundred thousand men is entirely a private question?

Mr. Gary—Certainly not.

The Chairman—Then why—

Mr. Gary—(interrupting)—I do not believe your question is germane to the inquiry that you have previously made, as I view it. I may be wrong, Senator. Certainly strike matters are of public interest, of the highest public interest.

I believe the sentiment of the country is largely in favor of the open shop as against the closed shop. I certainly believe that, and if I did not—if you could convince me to the contrary, Senator—

The Chairman—I agree with you.

Mr. Gary (continuing)—It would have a very great influence on our action, I assure you.

The Chairman—I agree with you as to the closed shop and the open shop. There is no quarrel about that.

Mr. Gary—You say you do agree with me?

The Chairman—I do. You are going to defeat the closed shop.

Mr. Gary—I am mighty glad to hear that, Senator.

and that the closed shop means less production, less work, higher costs.

I think, when you are discussing the question of the high cost of living, there is nothing more important to consider with it than that manufacturing establishments shall be allowed to operate unrestricted by labor unions or anybody else, depending upon the good will of the laborers, the workmen themselves, who of course are controlled by the treatment they receive, including wage rates and working and living conditions.

Now, as to the moral issue, I think it is immoral for a small minority of men organized, if you please, to compel by force a large majority to yield to their desires and to submit to their control, because if the industries of this country or any other were controlled by union labor, as it would be if these gentlemen are successful—and I am not dealing in personalities—it would mean decay, less production, higher cost, and this country could not succeed in its contest with other countries for the world's business. They would be in the condition that I fear England is in today, but which I hope it will come out of.

Now, I think when a few men, comparatively speaking, seek to impose their will to forcibly secure control of a business against the wishes of a large majority, that is immoral. That is my opinion of that. And here were outsiders, bear in mind, rank outsiders, who stated publicly away back at the St. Paul meeting, and it was testified here before this committee, that they were starting out to organize the steel industry, which they had failed to accomplish in the past. That was their view, not for the purpose of securing better pay, better conditions; none of the 12 points which have ben made since this strike was called, I think, none of those were mentioned. We have never heard anything about those 12 points. None of our men have made any complaint, but these men were forcing themselves into the steel business, to unionize it all and to control it, and what would happen if they got control of it? Is there any man here who has had any experience with organized labor who does not know? I can give you a good many instances—if you wish.

Believes in Collective Bargaining

SENATOR BORAH—If I understand your position is this: That even if these men had represented the unionized men in your employ, even if they had, beyond question, had credentials from the unionized men, yet, because they were unionized, and because they represented a union, you could not have dealt with them?

Mr. Gary.—You are wrong. I have not answered that. I have not intended to answer that. If they had come to me and said, what I believe to be the facts, 15 per cent, even if it had been 15 per cent—I do not think it was over 10 per cent from my information—but if they said "We represent 15 per cent of your men, and because we represent 15 per cent of your men, we should like to talk with you about that 15 per cent," I am not prepared to say that I would say "no" to that. I think I would have seen them.

We are not willing to do anything which we believe, after consideration, amounts to the establishment of a closed shop as against an open shop or that tends to do that. We stand firmly on the proposition, that industry must be allowed to proceed, untrammelled by the dictates of labor unions, or anyone else, except the employer and employes and the government. That is where we stand.

The Chairman—You concede the public have some interest in that, do you not?

Mr. Gary—The highest, senator. They are to be first considered. All private interests must yield to the public necessity and the public good.

Senator McKellar—When you spoke of the government you meant the people?

Mr. Gary—I meant the people by the government, of course.

Senator Borah—Without assuming to argue the question one way or the other, if labor can not deal with the great industries of the country collectively do you think that it will be practical or practicable or possible for labor to maintain itself and its rights, its wages and so forth, as against combined capitalism? Can labor deal with it without dealing with it in the same way, combined and collectively?

Mr. Gary—I think labor can deal collectively and it ought to be encouraged to deal collectively, and it ought not to be prohibited at any time from dealing collectively; but dealing collectively, in the form of committees, or however they themselves may decide, is one thing, and dealing collectively as insisted upon by the labor unions, which means that the union labor leaders shall decide all these questions, and shall represent the men, whether they are asked to or not, and will establish a basis for the closed shop, which would push out the individual voices of these men practically, is quite a different thing.

Senator Jones (of New Mexico)—It has been claimed there is such intimidation that the men in your employ will not form their own committees to present their grievances. Have you anything to say about that?

Mr. Gary—I have this to say: that there is no foundation for the assertion, Senator. In September, 1916, I wrote to the presidents of the subsidiary companies, and, as I have said previously, I announce the policies of our corporation always, and in my own way at various times.

Judge Gary then read a letter addressed to the presidents of the subsidiary companies in which he had said:

"Everyone, without exception, must be treated by all others, justly and according to merit, in accordance with out established custom. One of our workmen, or a number of our workmen, from any department, will continue to be received by the management to consider for adjustment any question presented.

"That is not a theory. That is a practice. That is a principle," said Judge Gary.

"We were not asked during the last few years to increase the wages of our men at any time, so far as I know—not a single time. We increased them over and over again. Why? Because we thought they were entitled to it, on the merits. We have always done that. We have stood for the highest wages, invariably. We have been the leaders in raising wages, and the last to decrease wages. In fact, I think we have decreased our wages but once since our company was organized in 1901, and we have increased them 10 or a dozen or 15 times, and as I have shown, they have trebled—and

Corporation Considers Representation Plan

IN TESTIFYING before the senate committee, Judge Gary referred to the employe representation plans adopted by various companies in the iron and steel industry and the demand of the labor unions that they be abolished. He said the corporation is studying the plans.

"If the plans prove to be successful, a benefit to the men, and satisfactory to the men, and they want them, we will probably adopt something of the kind," he said.

"We are consulting our men. We are not getting up a plan and putting it to our men and saying, 'This is the plan you must adopt.' We are not getting up a program and forcing it on our men. We try to find out what our men really want and then if it is practicable just put it into effect. We were not asked during the last few years to increase the wages of our men at any time, so far as I know—not a single time. We increased them over and over again. Why? Because we thought they were entitled to it, on the merits. We have always done that. We have stood for the highest wages, invariably. We have been the leaders in raising wages, and the last to decrease wages."

Judge Gary also said that if the majority of the men of their own volition expressed preference for the 8-hour day the corporation will endeavor to arrange for it.

on the merits. Consequently we have not had much if any complaint from our men."

Senator Phipps—It has been claimed by witnesses that the opposition of the Steel corporation to organized labor extended to that point where the corporation several years ago had made a large appropriation for the purpose of destroying the union. Have you anything to say on that?

Mr. Gary—I have. A witness stated that we had established a fund of from one million to twenty million dollars to drive out unions. We never established any fund or appropriated a penny for such a purpose.

Senator Walsh—Well, do you or do you not believe in the labor organizations?

Mr. Gary—If you mean whether I believe they are beneficial to the community—

Senator Walsh (interrupting)—To the workmen themselves.

Mr. Gary—Well, no—

Senator Walsh (interrupting)—No. That answers it. You do not.

Mr. Gary—No. that is your answer, not mine. Excuse me. I will not deny that labor unions may be a good thing in places and at times and to a certain extent as tending to protect labor, the interests of labor. I will not deny that, but I do deny that the universal practices of labor unions, labor unions carried to the extent which permits outsiders, agitators or anybody else to universally establish the closed shop, is inimical to the best interests of the employes and to the general public. Now, then, you draw your own conclusions as to whether that means I do not believe in it.

Considering Straight 8-Hour Day

SENATOR WALSH—Now, I suppose you will agree that there has been no force in America that has done more to shorten the hours of labor—

Mr. Gary—To do what?

Senator Walsh—To increase wages, to better living conditions of the workman, than organizations of labor.

Mr. Gary—I deny it positively and emphatically. I want to say that the United States Steel Corp. has been in the van all the time—

Senator Phipps—One important element there is whether or not the 8 hour day had been generally instituted where that was practicable, or not, or whether you were in 1914 adhering to the 12 hour day.

Mr. Gary—You mean whether we had adopted that? I do not remember exactly when we adopted the 8 hour basic day. The employes do not want 8 hours; that is, generally.

Now then I want to say, because this question has been up several times with reference to hours, I think there is a large portion of the public that believes in the eight hours, and on the ground that that is long enough for a man to work out of the twenty-four. I believe that, and I believe there are a good many employes—I do not say a majority or anything like a majority, but there are a good many employes—who believe the same thing. We are very carefully considering that question. Of course, if we should immediately limit the hours to eight and pay for the eight hours the same that these men are getting for ten or twelve, every employe would favor it, naturally, and an employe is always entitled to insist upon whatever he thinks he ought to have, and we might not always grant his request if it seemed to be unreasonable, but I want to say this, that, as a matter of policy and principal, if we can make it practicable to adopt eight hours throughout our works universally, and the men themselves are willing to accept that basis, we would be very glad to adopt it, for the reason, if for no other, that we think there is a strong public sentiment in favor of it, and I would not be put on record here or any other place as opposing the 8 hour basis if the men themselves want it and will accept it.

Gives Figures on Welfare Work

MR. GARY—Mr. Chairman, may I take the opportunity to put in just a few figures? I want to say that we have expended for residences to rent to our workmen, or in some cases, to sell to our workmen, if they desire to buy, $32,000,000, and have appropriated $7,000,000 more, not yet expended, but in process of expenditure.

Senator McKellar—On what terms do you sell to your workmen?

Mr. Gary—Any terms, almost, that they ask for. The rent which we are receiving on the houses we have provided has not been increased in amount since 1914. We have paid out for welfare work, from 1912 to the first six months of 1919, inclusive, $65,868,707.09.

Senator McKellar—Do you have a retiring scheme for old age?

Mr. Gary—Yes; a pension, we have. If a man has been in the service 20 years, I think it is, and is 70 years old, he retires on a certain percentage of his salary.

It is very liberal. Welfare, ten million, seven hundred and twenty-one odd thousand dollars; sanitation, ten million and some odd thousand; accident prevention, five million, nine hundred and sixty-one odd thousand dollars; relief for injured men and the families of men killed, twenty million, nine hundred and fifteen odd thousand; and the employes' stock subscription plan—that is, the 25 points for the stock in five years.

Mr. Lindabury—The Steel corporation's contribution?

Mr. Gary—Yes. The Steel corporation contributes 25 points on that stock to the employes, five points a year. The amount is $8,460,000. For pension fund payments, in excess of income provided by the permanent fund, which is $12,000,000, $4,000,000 of which Mr. Carnegie contributed, and $8,000,000 of which we contributed—that amount is one million, seven hundred and forty-eight odd thousand dollars.

Senator McKellar—Do you require any of your employes to pay anything on the retirement fund?

Mr. Gary—Nothing; no, sir, we do not.

Senator McKellar—The corporation pays it all?

Mr. Gary—Pays it all. Up to date it is large and increasing. That makes a total of $65,000,000; that is, from 1912 to the first six months of 1919, inclusive.

Senator Walsh—And you have your own workmen's compensation department?

Mr. Gary—Yes; and we inaugurated or adopted that before the state laws came into force.

The natural way to settle all industrial questions is to leave everyone open and free to act on the basis of natural laws and regulations, so long as every one carefully observes the requirements of the law. I believe if the attitude of the public is to insist, first, upon observing the requirements of the law, of maintaining absolute peace, of preventing breaches of law and unlawful disturbances, so that every man and every interest is protected, that this whole difficulty will work out. I think people ought to be allowed to make their own agreements, their own contracts with their men. If one side or the other is transcending the rules of propriety and decency, public sentiment will correct that evil. I believed that when at the beginning of our organization we started out to give the public information of our operations and our management—when we permitted government representatives to examine our books and our accounts from time to time, sometimes costing a good deal of money, and occupying a good deal of our time, I think the strongest force we have in securing and maintaining peace and contentment is an enlightened public sentiment.

Now, if it is desired and found necessary by such as you to furnish additional protection to one interest or another, to the foreigners or to Americans, of course, you can pass general laws for governing them. Speaking now only for myself, and not for the corporation—because while I have a good deal of authority and power, I use the same very sparingly, I am in the habit of consultation—speaking for myself, I would not object to a law for federal incorporation or license, which would result in the appointment of a disinterested commission, appointed by reason of their fitness, their qualifications,

who should determine when and how and under what conditions a corporation should receive its charter or its license, and should have supervision over the management of the corporation, including even the labor question; provided, however, that at all times the question of principles, the fundamentals having application as determined by the law, might be reviewed by a legal tribunal, by a court, a federal court with ample jurisdiction and authority.

I think the final decision of all these questions, industrial or otherwise, must be left to the courts of the country, those who are disinterested, who are impartial, who are selected because of their fitness to represent and carry into effect the principles of the constitution and the laws. I have no sympathy whatever with the statements which have been made by labor leaders in regard to the courts, where the courts have been condemned and criticized for their action, and I think it is as false as false could be—the claim that the action or the decisions of courts as a rule have been partial and influenced by one industry or one interest or another.

Testimony was given before the committee by a number of steel workers in the employ of the corporation. Threats, violence and methods of intimidation characterized the bolshevistic spirit of strikers when the steel strike began on Sept. 22 at New Castle, Pa., according to T. J. Davies, tin plate roller, who said he represented 5000 tin mill workers.

The witness said he makes $17 a day, eight hours a day, and five days a week. He said workmen either individually or as committees can take up their grievances with the management of the plant. Senator Kenyon asked if there were any evidence of bolshevism among the strikers.

"I think there is," he replied, "because the men said they would not need bosses any longer but that the mills would be run by committees."

A large, robust man, ruddy of cheek, high forehead, with a face that expressed intelligence, and a good natured and rather youthful appearance, Rufus Smith, of Welsh ancestry, born in England, gave evidence belying tales of horrible working conditions in steel mills. Mr. Smith is a stripper at the Homestead works of the Carnegie Steel Co., earning $23 a day, and working 12 hours, six days a week.

"You do not look as though you had lost your health," suggested Senator Kenyon.

Mr. Smith said that when he was "a young man" he had belonged to the union.

"Would you like to be affiliated with the union again?" asked Senator Phipps.

"No, sir," replied Mr. Smith.

"Would the men who are working with you?"

"I think not. As it is they can take up their grievances."

Foster Hedges; Tighe Also Testifies

IF WILLIAM Z. FOSTER, secretary of the national committee for organizing iron and steel workers, has changed his views and repudiated those expressed in his book on syndicalism, as he and other trade unionists have declared, his manner and his testimony before the senate committee investigating the steel strike did not leave that impression upon many of his hearers, including some of the committee. His first statements and his apparent ease when he took the witness stand led many to believe that perhaps he had renounced his early teachings and doctrine, but the minute he was questioned as to his writings, he hedged, charging that he had been grossly misrepresented in the press, and evaded "yes" or "no" answers to queries which were made in order to get his position accurately defined.

Foster went on the witness stand last Friday afternoon after the recess which followed the concluding testimony of M. F. Tighe, president of the Amalgamated Association of Iron, Steel and Tin Workers. Flanked by Tighe and President Samuel Gompers of the American Federation of Labor on one side and W. B. Rubin, counsel for the steel workers' committee on the other, the self-styled reformed member of the I. W. W. began his testimony. He admitted he personally knows little of conditions in the steel industry.

Foster's first evasion was an attempt to get Senator McKellar, who asked him for his views on syndicalism to let him answer a question he said Chairman Kenyon has asked him. Mr. McKellar, however, refused to be put off and demanded of Foster an answer as to whether he still believed what he had written about revolutions. Foster declined to make a positive answer, saying he would go into the full subject of the book providing the press would be excluded from the room.

That was recognized by the press and apparently by some of the committee, as Foster's first error in trying to maintain that he is no longer an I. W. W. So continuous was his refusal to answer because of his alleged fear of misconstruction in the press, that the senators tried to show him he needed to be set right before the country and that the more frank he was the better for his cause. Foster declined, however until Gompers, whose expression showed his displeasure with the witness, finally burst out with:

"They cannot say anything worse about you than they have said."

Of course, the press was not excluded, and Foster's answers became more evasive. At one time, asked if he still believed one of the passages he had written, he made the damaging admission that some parts of it he did, some parts he did not. Pressed by Senator McKellar he evaded an admission or a denial by simply saying what he had written could not be defended. Further on in his testimony he was questioned concerning his early belief that "the syndicalist should allow no consideration of 'legality,' 'religion,' 'patriotism,' 'honor,' 'duty,' etc., stand in the way of his effective tactics" in struggling "with capitalism."

When he was asked about his writings on "Labor Fakirs," written at the time he was an admitted I. W. W., Foster said he had acted under an unfortunate misunderstanding due to his narrow views. Since then, he said, he had changed his mind although he admitted the labor federation, like all institutions, had some crooks in it. While he was being questioned on this point, Samuel Gompers sat rigid, with his eyes fixed on the table. When Foster admitted he had no one particularly in mind as a "Labor Fakir," Gompers sat back, smiled, and wiped his face and forehead with his handkerchief. Senator Walsh, who has given indications of sympathizing with the labor side of the strike, leaned across the table and, as if to disarm those who might make capital of Mr. Gompers' action ,asked him if he felt relieved.

Tighe, in testifying before the committee, declared that the United States Steel Corp., instead of leading in advancing wages, as Judge Gary claimed, has lagged behind other corporations. He insisted that unions had never sought closed shops but "union shops."

"When the management signs a contract as to scales and working conditions, it is a union shop," he explained.

"The effect is the same as a closed shop, isn't it?" asked Senator Sterling, Republican, South Dakota.

"No," said Tighe. "We are not asking for closed shops and never have."

Tighe read an advertisement of 1909, credited to the United States Steel Corporation, which said:

"Men wanted—Syrians, Poles and Roumanians preferred."

"The gentleman's (Judge Gary) remarks about foreigners now," Tighe remarked, "are not well taken in view of that."

"Do you charge that from 1909 on there was a steady increase of foreign workmen in the steel company's mills?" asked Senator Walsh, Democrat, Massachusetts.

"Yes, I do," Tighe answered.

On Oct. 1, he said, 363,600 men were on strike.

"How many of those strikers cannot speak English?" asked Chairman Kenyon.

Tighe had no exact information, but said:

"To be frank about the matter, I think the largest percentage of them are foreign born.

"I wouldn't be doing justice to my organization," Tighe concluded, "if I failed to contradict Judge Gary's statements. The corporations have used the vicious element they complain of; I want to protest that neither our organization nor the American Federation of Labor has any vicious element in it.

"This strike was called because Judge Gary would not grant the request for a conference with the 24 unions. If he had done that there would have been no strike."

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

CARLETON S. KOCH, who succeeds A. O. Backert as president of the American Foundrymen's association, specialized in chemistry and metallurgy while obtaining a technical education in an engineering school and upon graduation entered the foundry industry as an employe of William Sellers & Co., Philadelphia. From this company he went to the Titusville plant of the American Radiator Co., as assistant manager. Later he became manager of the Franklin works and subsequently of the Sharon works of the American Steel Foundries. In 1906 he formed and became president and general manager of the Fort Pitt Steel Castings Co., McKeesport, Pa. Mr. Koch has been active in the affairs of the foundrymen's association, and is a member of the standing committee on specifications for steel castings to co-operate with the American Society for Testing Materials.

George J. Webster, general manager of the Charcoal Iron Co. of America, Detroit, has resigned, effective immediately. He has been made a member of the board of directors.

John F. Schurch, operating vice president of the T. H. Symington Co., Rochester, N. Y., has been elected vice president in charge of all western sales, with headquarters in Chicago.

Harry T. Calkins recently became affiliated with the sales force of the Tacony Steel Co., Tacony, Pa., Philadelphia. Mr. Calkins will be attached to the New York office but will sell in Connecticut exclusively.

C. E. Duncan, formerly department manager in the Bethlehem Steel Co., South Bethlehem, Pa., will superintend the erection of Kansas City's first steel rolling mill to be erected by the Kansas City Bolt & Nut Co.

D. F. Edwards has resigned as secretary and treasurer of the Gier Pressed Steel Co., Lansing, Mich., to become affiliated with the Willys Corp., at the Dusenberg plant, Elizabeth, N. J. He will be one of the active executives of the new Willys organization.

H. E. Townsend, formerly with the Carnegie Steel Co., at Clairton, Pa., and the Wickwire Steel Co. at Buffalo, N. Y., has been appointed general superintendent of the Franklin open-hearth department and mills of the Cambria Steel Co., Johnstown, Pa.

Capt. Henry A. Butler, who recently returned from Red Cross service in France, has resigned as manager of the order department of the Youngstown Sheet & Tube Co., Youngstown, O., to become president and manager

C. S. KOCH

of the Valley Investment Co., that city.

J. H. Siebert, who has been affiliated with the Liberty Steel Products Co., New York City, now is connected with the National Trading Co., Cleveland. Mr. Siebert is a son of William P. Siebert, assistant general manager of sales for the Carnegie Steel Co., Pittsburgh.

Charles E. Childs, secretary and treasurer of the Hampton Co., Easthampton, Mass., since its organization in 1900, has resigned and will retire from active business life. He formerly was vice president and assistant treasurer of the West Boylston Mfg. Co.

Howard R. Reese, formerly with the Standard Parts Co., Cleveland, and at one time attached to the sales department of the Carnegie Steel Co., Pittsburgh, now is sales manager of the Universal Steel Co., Bridgeville, Pa., manufacturer of tool and alloy steels.

Walter B. Lashar, president of the American Chain Co., Bridgeport, Conn., is chairman of the executive committee for Connecticut which will raise the state's quota of the Pilgrim Memorial fund. He also is a member of the national commission.

Charles R. Gabriel, consulting engineer of the E. W. Bliss Co., Brooklyn, N. Y., delivered a paper on power presses before a meeting of the pressed metal manufacturers in Cleveland, Sept. 22. Mr. Gabriel's paper was accompanied by lantern slides showing presses made by the Bliss company in actual operation in various plants.

Stephen A. Douglas, vice president and general manager of the Wilson Welder & Metals Co., New York, has been transferred to the New York office to take the position formerly filled by R. S. Drummond, who recently resigned. Mr. Douglas will continue his Cleveland and Detroit offices and will spend part of his time in Detroit.

Frank J. Lanahan, president of the Fort Pitt Malleable Iron Co., Pittsburgh, has been nominated by the nominating committee of the Railway Club of Pittsburgh, to serve as first vice president for 1919-20. The rest of the officers to be voted upon by mail ballot are as follows: President, Col. H. H. Maxfield, works manager, Pennsylvania railroad car shops, Altoona, Pa.; second vice president, Samuel Linn, master car builder, Pittsburgh & Lake Erie railroad, McKees Rocks, Pa.; secretary, J. D. Conway, Pittsburgh; treasurer, F. H. Stark, superintendent, freight car repairs, Pittsburgh & Lake Erie railroad, Pittsburgh; committee chairmen, executive, L. H. Turner, superintendent of motive power, Pittsburgh & Lake Erie railroad, Pittsburgh; finance, E. C. Sattley, general manager, Page Steel & Wire Co., Pittsburgh; membership, A. Stucki; entertainment, D. H. Amsbary.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

HORACE S. WILKINSON, who last week was elected chairman of the board of directors of the Crucible Steel Co. of America, Pittsburgh, to succeed Herbert DuPuy, was for a number of years president of the Halcomb Steel Co., Syracuse, N. Y., now part of the Crucible Steel Co. He has been a director and member of the executive committee of the Crucible Steel Co. for some time past. He also is president of the Toledo Shipbuilding Co., and of the Great Lakes Steamship Co., and serves on the directorates of the Barrett Co., New York, and several other companies. The directors also chose new directors classed as Wilkinson men to replace three of the DuPuy organization. The vacancy caused by the death of T. Hartlet Given was filled by Hamilton Stewart of the Harbison-Walker Refractories Co., Pittsburgh. It is expected that the annual meeting, Nov. 21, at Jersey City, N. J., will see other changes made. Headquarters are to remain in Pittsburgh.

HORACE S. WILKINSON

After his election Mr. Wilkinson issued a statement setting forth the policy he will pursue. He said that it would be the purpose of his administration to seek a closer relationship with the trade and with the company's employes and that the shareholders would receive their full share of the profits in periodical disbursements. There will be no change in the personnel of the officers and the main operating office will remain at Pittsburgh, with the eastern office at New York.

Herbert DuPuy, who has retired from the Crucible Steel Co. of America, Pittsburgh, which he had served as chairman of the board for the past 10 years, had been identified with that company since its formation July 21, 1909. As one of the owners of the Anderson-DuPuy Spring Works, with a plant at McKees Rocks, Pa., one of the constituent companies of the Crucible Steel Co., he became a director of the latter at organization, and served in this capacity until the death of David Park, to whose place as chairman of the board he was elected. Mr. DuPuy has extensive coal and coke interests and is the dominant factor in the Pennsylvania Rubber Co. with a large plant at Jeannette, Pa. He is a Lehigh university man.

H. C. Malsness, who for the past 14 years has been southwestern representative of the mill machinery department of Nordyke & Marmon Co., Inc., Indianapolis, has been placed in charge of the new office established at Kansas City by Sprout, Waldron & Co., Muncy, Pa., mill builders and furnishers.

A. G. Gibbons, formerly superintendent of tools and supplies for the Winslow Bros. Co., Chicago, has become affiliated with the Wetmore Reamer Co., Milwaukee, in the capacity of production engineer. Mr. Gibbons at one time was connected with the Cadillac Motor Car Co., Detroit and with the Brown & Sharpe Mfg. Co., Providence, R. I.

Charles T. Treadway, who for the past 19 years has been treasurer of the New Departure Mfg. Co., Bristol, Conn., has resigned effective Nov. 1, and will be succeeded by W. E. Wightman who has been assistant treasurer. Mr. Treadway is president of the Bristol National bank and holds the same position in the recently incorporated American Trust Co., as well as that of vice president in the Horton Mfg. Co., and these outside interests demand his entire time and attention. He also is president of the Bristol Realty Co., president of the manufacturers' division of the chamber of commerce and is largely interested in the Bristol Mfg. Co., and the American Silver Co.

Charles Eugene Schneider, head of Schneider & Co., Creuzot, France, is a member of the French economic mission which with similar missions from Great Britain, Belgium and Italy sailed from Brest for New York on Oct. 6. The purpose of the visit is to inform the American public of the economic situation of Europe and advocate financial co-operation between the powers during the period of reconstruction.

CHARLES EUGENE SCHNEIDER

W. G. Ziegler succeeds Mr. Coleman as plant engineer for the Pratt & Whitney Co., Hartford, Conn. Mr. Ziegler served as captain in the ordnance department at Washington during the war and prior to that was affiliated with the Columbia Graphaphone Co., Bridgeport, Conn. At one time he was plant engineer for the Marlin-Rockwell Corp., New Haven, Conn.

103 Stacks Banked in September

Last Month's Pig Iron Production Greater Than in July—Merchant Output Gains in Spite of Strike Handicap While Nonmerchant Tonnage Falls—163 Stacks Active

IN SPITE of the fact that the output of coke and anthracite pig iron was rather seriously affected by the iron and steel strike for over one-fourth of the month of September, production registered an increase over that of July. Many stacks were banked during the latter part of the month, but production in the first three weeks of September was at a higher rate than during the previous month.

MONTHLY PRODUCTION

	1919	1918	1917
January	3,306,279	2,403,227	3,159,839
February	2,947,555	2,318,242	2,649,935
March	3,088,023	3,209,996	3,255,813
April	2,474,374	3,273,355	3,328,061
May	2,107,729	3,451,884	3,413,677
June	2,114,028	3,316,148	3,260,234
Total 1st half.	16,037,988	17,972,852	19,067,559
July	2,424,212	3,408,584	3,337,442
August	2,742,081	3,378,479	3,238,970
September	2,402,011	3,413,223	3,140,742
Total 9 months	23,606,292	28,173,138	28,784,713
October		3,482,392	3,296,286
November		3,347,844	3,198,597
December		3,434,114	2,885,380
Total 2d half..		20,464,636	19,097,417
Grand total..	23,606,292	38,437,488	38,164,976

Production for the month shows a decrease of 9.5 per cent over August while August showed an increase of 12.5 per cent over July. The September total was 2,402,011 gross tons, a decrease of 340,070 tons from the August total of 2,742,081 tons. Daily production fell from 88,453 tons in August to 80,067 tons in September, a decrease of 8386 tons.

As might be expected from the nature of the present strike, the greatest effect has been on the nonmerchant or steel works blast furnaces. Merchant furnaces have been able to increase production in spite of the fact that some few were banked. Blast furnaces in the southern states, southern Ohio and eastern Pennsylvania were practically undisturbed by strike trouble and many of the furnaces in these districts are merchant producers.

Nonmerchant production fell from 2,175,517 tons in August to 1,806,679 tons in September, a decrease of 368,838 tons. On a daily basis, steel works output amounted to 60,222 tons, 9956 tons less than the 70,178-ton average of the previous month. Total merchant production for the month was 573,568 tons, a gain of 25,143 tons over the 548,425 tons of the previous month. On a daily basis, the September figure of 19,119 tons is a gain of 1428 tons over the August figure. This increase in average daily merchant production amounts to 8.09 per cent while the decrease in nonmerchant daily average amounts to 14.2 per cent.

Active stacks on Sept. 30 numbered 163 compared to 266 in blast on the last day of the previous month. This is a decrease of 103 stacks and the smallest number of furnaces in blast since December, 1914, when 154 furnaces were in operation. Of the 103 stacks put out of blast during the month, practically all were banked. Again significant of the effect of the strike on the steel works and nonmerchant producing furnaces, 94 steel works stacks were banked or blown out and 3 lighted compared to 17 merchant stacks banked or blown out and 5 lighted.

Total pig iron made during the first nine months of the year is 23,606,292 tons compared to 28,173,138 tons during the corresponding period of 1918 and 28,784,713 tons for the same period of 1917.

AVERAGE DAILY PRODUCTION

	1919	1918	1917	1916	1915
Jan.	106,654	77,523	101,930	102,319	51,323

Av.	86,577	105,293	104,562	106,610	81,022

Spiegeleisen production dropped from 8179 tons in August to 4656 tons in September, a decrease of 3523 tons. Ferro production, however, increased from 9960 tons in August to 17,108 tons during last month, a gain of 7148 tons.

The Jones & Laughlin Steel Co. lighted its fifth Aliquippa stack on Sept. 8. This furnace was recently completed.

To Begin Seattle Mill

Erection of a new steel rolling mill in Seattle will begin within the next 60 days, according to announcement of the officers of the Western Rolling Mill Corp. The first building will be 73 x 300 feet and it is expected the first two units will be in operation in five to six months. The company has acquired a site at the southern limits of the city, comprising approximately 65 acres. The 9-inch and 22-inch mills will be the first units in operation. Bars, both rounds and flats and angles, will be the initial output of the new mill.

The Western Rolling Mill Corp. is headed by J. Johnson, who is a practical steel man from the East, as president; J. M. Price, vice president, and Frederick Bruhn, secretary-treasurer. Offices are maintained at 401-403, Pacific building, Seattle.

The Morgan Engineering Co., Alliance, O., has been awarded six cranes by the Aluminum Co. of America, for its new works at Marysville, Tenn.

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

MACHINERY for paper making is to be manufactured in a plant to be established by the Dominion Bridge Co., Toronto, Ont. For some time the company has been devoting considerable attention to the production of special engines and machinery and sees in the present heavy demand for pulp and paper machinery an excellent opportunity to enter a new field. According to a statement recently issued, the company already has closed contracts with several Canadian paper manufacturers for machinery, built from designs worked out by the company's engineers to meet their requirements.

* * *

FREYN, BRASSERT & CO., engineers, Chicago, have been retained by the Koninklyke Nederlandsche Hoogovens en Staalfabrieken, The Hague, as consulting engineers, in connection with the blast furnace plant to be erected at Ymuiden, Holland.

* * *

THE Atlas Machine Co., Providence, R. I., is planning to open a branch plant in Springfield, Mass., for the building of the Shanklin rapid transfer machine, the invention of Ben. M. Shanklin, Springfield. The machine, was exhibited at the annual electric railway association convention in Atlantic City, Oct. 6 to 10.

* * *

ARNOLD J. HOLLING, steel manufacturer of Sheffield, Eng., is making a trip through Canada for the purpose of establishing a steel manufacturing enterprise. He has indicated Winnipeg as the point likely to be selected owing to the favorable location of that city for large operations. He will visit the Pacific coast before returning to England.

* * *

THE Allegheny Gear Works, Pittsburgh, which bought a portion of the vacant property at the northwest corner of Page and Chateau streets N. S., Pittsburgh, from the National Casket Co., also has obtained a purchase option for the entire plot, which is 129 x 284 feet. The contract for a fireproof building, 80 x 135 feet, of concrete, brick and steel sash construction, has been awarded to Toupel, Beil & Co.

* * *

STOCKHOLDERS of the Ohio Trailer Co., Cleveland, have voted to ratify recommendations of the directors for increased capital and a change of name. The company is to be known as the Ohio Motor Vehicle Co., and will expand its production to include pleasure cars. The capital increase authorized was from $300,000 to $1,000,000.

* * *

THE Westfield works of the Tennessee Coal, Iron & Railroad Co., Birmingham, Ala., is working on steel fabrication for 10 ships to be constructed at the yards of the Chickasaw Shipbuilding Co., subsidiary of the Tennessee company. This material is receiving preference, in the transportation facilities being offered this district.

* * *

NEW agencies will be established in Norway and Sweden and possibly Denmark by the Norton Co., Worcester, Mass., for the sale of its products in 1920. A complete reorganization of the foreign sales department is under way at present, following recent extensive changes brought about through the consolidation of the Norton Co. and the Norton Grinding Co.

* * *

OPTION on about 1000 acres of land on the west side of the Cacapo mountains, Warren county, West Virginia, have been taken by the Harbison-Walker Refractories Co., Pittsburgh. The land has deposits of hard gannister rock. Engineers of the company now are conducting a survey and in the event of a favorable report the option will be exercised and operations started at the new site.

* * *

INCORPORATED for $250,000 in Ohio, a branch of the Lumen Bearing Co., Buffalo, is preparing to build a brass casting plant in Youngstown, O. It will manufacture bronze bearings. The plant will include the following departments: smelting, refining, brass, bronze and aluminum foundries, brass machine shop, tool room and grinding room. H. P. Narrock, formerly of Youngstown, is general manager and W. H. Barr is president.

* * *

CONTRACT recently closed by the Bath Iron Works, Bath, Me., calls for a steel cargo carrier for Crowell & Thurlow, Boston. The vessel will be 410 feet long, 55 feet beam, 34 feet 6 inches deep, and will have a deadweight capacity of 9500 tons. It will be the largest ship ever built at the Bath yards, except for the navy, net displacement being between 13,000 and 14,000 tons. The 10,000-ton steel cargo steamer ARYAN will be launched early in October from the yard of the Texas Co., Bath, Me.

* * *

TWO 25,000-kilowatt steam-driven turbine units have been ordered from the Westinghouse Electric & Manu- Co., East Pittsburgh, Pa., for shipment to Japan. When installed, they will complete the largest steam-driven electrical installation in the Far East, now being erected at Osaka, Japan, for the Osaka Electric Light Co. This company furnishes light and power to street railways, steel plants, shipyards, copper refining plants, paper mills, electro-chemical installations, etc. These two new units will bring the capacity of this plant up to 100,000 horsepower.

* * *

ONE of the largest foundry and machine shops in Ohio is being erected for the Toledo Machine & Tool Co., Toledo, O., on a 22-acre site. Four buildings, including a foundry, boiler and engine houses, and sand storage building now are being constructed. Elevated railway tracks, coal pits for storing several thousand tons and a large crane are being installed. Approximately $400,000 is being expended for the first units but eventually much more will be spent. The new plant is to be used for the manufacture of heavy tools and machinery while the old plant will be utilized for smaller tools and machines.

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

WILLIAMS & CO., INC., sole distributors in the Pittsburgh district of Shelby seamless steel tubing and of monel metal, as well as large purveyors of nickel rods, castings, and wire and brass rods, tubing and pipe, now are located in their new quarters, which comprise a general office and warehouse building, fronting on Pennsylvania avenue, that city, and running almost an entire block. This building, purchased several months ago by the company, has been entirely rehabilitated and enlarged and houses the company's large stock and a number of motor trucks and automobiles.

The Williams company, in 12 years has grown to one of the largest distributing companies in Pittsburgh. It was incorporated June 15, 1907. It has specialized in Shelby seamless steel tubing, a product of the National Tube Co., and carries in stock about 50 carloads of this material. The company's stock of steel tubing, though chiefly of rounds, includes hexagons and squares. Monel metal, another of the company's specialties, is carried in rods, bolts, nuts, washers, castings, wire, nails, etc. The company also handles brass rods in rounds, hexagons and squares in various sizes. Two booklets, entitled "Shelby Seamless Steel Tubing," and "Monel Metal," are being distributed by the company.

* * *

INCORPORATED at $75,000, the Algyre-Gilmore Machine Tool Co., will operate a blacksmithing and machine shop at Biggs, Okla. Joe T. King, C. L. McMahon, W. C. Wangerine, George A. Gifford, R. G. Rapp, Charles Gilmore and H. D. Algyre made up the board of directors. Mr. Algyre was elected president and Charles Gilmore, secretary and treasurer. Ground for the plant has been broken and machinery and equipment is on the way. It is expected that operation will commence about Nov. 1. The company will make a specialty of repair work pertaining to the oil industry.

* * *

THE Fabricated Ship Corp., Milwaukee, which laid its first keel on Nov. 5, 1918, launched its first vessel on Sept. 12. It is a mine-sweeper type and one of 13 steel ships being constructed for the Emergency Fleet corporation. The first vessel was christened the MAJ. GEN. JOHN P. STORY. Three more hulls are ready for launching and the keel of the sixth was laid when the STORY vacated the berth. The Milwaukee yard will do the complete work on the vessels, including the installation of engines and machinery. The STORY will be ready to turn over to the government to go into commission about Oct. 15.

* * *

A NEW company has been formed to conduct the construction business for the Minneapolis Steel & Machinery Co., Minneapolis, which formerly was handled by the Twin City Co. It is known as the Minneapolis Steel Construction Co., and its officers are A. M. Burch, president and Guy P. Johnson, secretary. It will handle all steel erection, the construction of buildings, bridges, water towers and tanks, barges, boats, elevators, etc., while the Twin City Co. will act as a sales company for all the products of the Minneapolis Steel & Machinery Co. In the reorganization of the Twin City Co. and the establishment of the construction company, it was necessary to change the personnel of the management. The new officers are: President, George L. Gillette; vice president, N. B. Nelson; secretary, E. A. Merrill; and treasurer, Cal. Sivright.

* * *

A CHARTER authorizing $1,000,000 capital has been granted the Shafer Bearing Corp., Chicago, which has just been organized to manufacture a full line of roller bearings for passenger cars, trucks, tractors, etc., on an entirely new principle, a bearing automatically self-aligning. At the meeting just held Julius E. Shafer, formerly secretary of the Makutchen Bearing Co., was elected president; George D. Bailey, of the George D. Bailey Co., Chicago, was made vice president; C. F. Ferguson, at one time sales manager of the Imperial Wheel Co. and more recently vice president and general manager of the George D. Bailey Co., was elected secretary and treasurer. These officers will serve for a year.

Otto Cullman, president of the Cullman Wheel & Gear Co., Chicago, was elected chairman. The new corporation is really an enlargement of the George D. Bailey Co. and has been organized to take care of the heavily increased business of the older institution. Its main offices will remain in Chicago, but branches are being opened in New York, Minneapolis, Kansas City and other distributing centers.

* * *

DETROIT Hexagon Drill Co., manufacturers of drills, has moved its offices from the Free Press building to the large structure at Woodward and Atwater streets where the plant is located, upon which a lease recently was taken. The building is four stories and basement with a space of 10,000 feet to each floor. The occupancy of the larger quarters has ben necessitated by the large increase in volume of business.

* * *

FRANK MOSSBERG CO., Attleboro, Mass., advises that Frank Mossberg no longer is connected with the company. This is to correct a statement in the Sept. 25 issue of THE IRON TRADE REVIEW to the effect that the Mossberg Pressed Steel Corp., of Attleboro, now being financed would be managed by Mr. Mossberg. Walter I. Tuttle at present is president of the Frank Mossberg Co., Silas Tuttle, vice president, Everett L. Ford, secretary, and Frank T. Chase, treasurer.

* * *

THE first steel barge to be built by the United States government at the head of navigation for the upper Mississippi traffic was launched into the waters of the St. Croiz river at Stillwater, Minn., Sept. 27. This barge is one of six being manufactured by the Minneapolis Steel & Machinery Co., at its fabricating plant in Minneapolis. The barges are being leased by the government for the purpose of carrying iron ore from Minneapolis and St. Paul and St. Louis for bringing back coal. Each barge is 300 feet long by 48 feet wide and contains 500 tons of steel. The unloaded draft is 18 inches.

Wall Street Sees Strike Failure

Steel Shares Active in Face of Crisis—Judge Gary's Estimate of the Valuation of Steel Corporation's Assets Excites Interest—Exports' Gain Complicates Exchange Problem—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

WALL street's display of strength in the face of the present industrial crisis is one of the most cheerful signs of the existing situation. The stock market in the past has proved its powers of prognostication and the marked activity and substantial advances of steel shares is accepted as the judgment of the financial community that the courageous fight for the open shop and against radical union domination of industry is as good as won.

Judge Gary's interesting statement last week before the senate committee that the property valuation of the corporation reaches the immense sum of $2,250,000,000 has attracted much interest in financial circles. The corporation has preferred stock outstanding to the extent of $350,000,000; common stock of $505,000,000 and bonds of about $650,000,000, making $1,500,000,000 in all.

"Our properties are actually worth $2,250,000,000," Judge Gary told the committee. "That is susceptible of demonstration. There is no question about that. The properties could not be replaced for any sum, and on that basis the amount of net profits that we are realizing is very moderate; on the basis of our capital stock it seems perhaps somewhat large, but our properties are worth very much more than our capital stock."

This estimate evidently does not include the corporation's several hundred millions of working capital. On the basis of the property investment the net profits of $167,562,280 in 1918 represented an earning of but 7 per cent. A conservative estimate of the book value of the common shares would place it at not less than $400 a share. The annual report of last year placed property account at $1,871,261,897.

Attention again has been drawn to the foreign trade situation involving the problems of international exchange and adequate export credits, by the extraordinary record of exports from the United States for August and for the year ending with August. The month shows a gain in exports over July of $75,579,000, while imports declined $22,000,000. The August exports were higher than any other month of the entire 12 with the single exception of the record-breaking month of June when the total was $343,999,609.

For the year the country's trade with foreign nations reached $10,648,000,000 with a favorable balance of $4,182,249,436 against an excess of exports of $3,126,024,089 for the corresponding period last year. Exports for the year were $7,415,098,901 as compared with $6,092,779,045 in 1918. Although June was the largest export month, the high level of imports was reached in July with a total of $434,999,609.

The continued tremendous outward flow of goods from the United States speaks eloquently of the need for goods in Europe and other parts of the world—a need so overwhelming that no barrier of prices or of exchange premiums appears sufficient materially to reduce the demand. It has been freely predicted that the nation's export trade is doomed if the exchange situation is not mended by a broad-scoped plan for advancing credits abroad. But month after month slips by, each one leaving astounding records of foreign shipments, notwithstanding the lack of such a plan. Credit arrangements now are confined to individual initiative.

The slump of exports in July was generally believed to reflect the influence of the exchanges but the recovery in August indicates that the July reduction was largely the result of shipping difficulties growing out of the harbor strike. A decrease in the September volume of exports is probable in view of the tie up of boats bound for British ports due to the railroad strike in Great Brtain.

Bankers are continuing to urge the necessity of advancing ample credits to Europe to permit industrial rehabilitation in the war-ridden nations, but a note of caution is creeping into the discussions of the situation. There is a feeling that some of the European countries are too dilatory about instituting the fiscal reforms which must be put into force if Europe is really to become a good banking "risk." These reforms have mainly to do with the provision of adequate taxation which will take care of internal debts and some arrangements for the deflation of paper currencies. There seems to be prevalent in Europe, with the possible exception of Germany, an unwillingness to face the cold facts of the situation left by the war. The people are living in an anesthesia of an immense paper money inflation which is inducing idleness and extravagance and the governments are reluctant about awakening them to the necessity of getting down to work, practicing economy and beginning the task of paying the great debt of the war.

The exchanges are in a state of nervous fluctuation and will continue so until the situation becomes settled, a situation encouraging speculation.

Last week the announcement that Secretary Glass was considering the question of adding the interest on the nearly $10,000,000,000 of European credits to the debt, strengthened the exchanges. It is announced also that he is discussing with the European governments the problem of conversion of the debt now in the form of demand obligations into more permanent form. From the signing of the armistice to Sept. 22 the government has advanced $2,229,502,000, advances averaging $280,000,000 a month during the first seven months.

British Sheet Producer Changes Ownership

One of the largest deals in the British iron and steel trade in recent years has been carried through by the acquisition of the firm of John Lysaght, Ltd., iron and steel manufacturers by H. Seymour Berry, of Merthyr Tydvil, D. R. Llewellyn and Lady Rhondda. The amount involved is between £4,000,000 and £5,000,000. Lady Rhondda is the widow of the late Lord Rhondda, of food control fame, and the owner of enormous collieries in South Wales, while her associates, already, have large iron and steel interests in South Wales.

The Lysaght firm was established in Wolverhampton, the heart of the Black country in 1857 and many years ago migrated to Newport. The firm, in the meantime, had built up an enormous business in galvanized

sheets, and for years has been a large producer for oversea customers, particularly Australia, New Zealand and Canada. Since its establishment in Newport, the firm has made great progress and has greatly extended its mills. In addition to Newport there are works at Scunthorpe, Bristol, and Broken Hill, Australia, while shipping interests are represented by subsidiary companies operating between Great Britain and Australia. Under the new control, Seymour Berry becomes chairman and Mr. Llewellyn deputy chairman. W. R. S. R. Lysaght and D. C. Lysaght remain directors. The board will also include Viscountess Rhondda.

Auto Activity Shown

Conclusive proof of the tremendous activity of the automobile industry is to be found in the report of the General Motors Corp., for the first six months of 1919, showing for that period a surplus, after charges, of $29,125,942—a gain of $17,408,462 for the same item in the corresponding period of 1918. The balance sheet of the company shows current assets of $233,468,273 and a net working capital of $161,860,417 an increase of $37,822,212 over the working capital as it stood at the end of 1918. This fact is largely due to new financing operations. Another conspicuous feature of the balance sheet is the fact that the cash on hand amounting to $74,799,443 is more than equal the current liabilities of $71,607,856. Net profits for the six months were $48,900,800 against $26,078,120 in the first six months of 1918. Federal taxes are estimated at $17,706,000 against $13,409,000. Preferred dividends were $522,392 and debenture dividends were $943,653.

Plans New Stock

A proposal to issue an additional $1,000,000 of preferred stock will be considered by the stockholders of the Truscon Steel Co., Youngstown, O., at a meeting held Oct. 7. In his letter to stockholders President Julius Kahn says the additional capital is required by the exceptional increase in the company's business. The Truscon Steel Co. is a producer of fabricated building products.

Vanadium Corp. Elects

At a meeting of organization of the Vanadium Corp. of America, the following officers have been elected: President, J. Leonard Replogle; vice president, Merrill G. Baker; treasurer, Lawrence K. Diffenderfer; secretary, Edward F. Nickerson. The directors were elected as follows: Charles M. Schwab, Mr. Replogle, E. R. Tinker, Allan A. Ryan, Ledyard Cogswell, T. Coleman du Pont, Harry Payne Whitney, and Joseph De Wyckoff. Hereafter the home office of the company will be in New York. It is understood that four more directors will be elected in the near future. Mr. Baker is to sail shortly for the company's mine in Peru, where he will supervise the installation of new machinery. This is expected to increase the output of ore.

Financial Crop Ends

AMALGAMATION with the General Motors Corp. of the Dayton-Wright Airplane Co., and the Dayton Metal Products Co. and the Domestic Engineering Co., large concerns of Dayton, O., has been announced. The deal is said to involve $25,000,000.

* * *

The Allied Steel Products Co., Aurora, Ill., has increased its capitalization from $2500 to $20,000.

* * *

Judge Maltbie has denied the application for the removal of the receivers of the Groton Iron Works, Groton, Conn.

* * *

The Hawthorne Mfg. Co., Inc., Bridgeport, Conn., maker of metal goods, has increased its capital stock from $200,000 to $297,000.

* * *

The Spicer Mfg. Co., Plainfield, N. J., has purchased the Parich Mfg. Co., Reading, Pa., and its big branch in Detroit. Charles A. Dana is president of Spicer Co., which makes automobile frames.

* * *

The Glasser & Quinn Mfg. Co., 1018 West Randolph street, Chicago, manufacturer of sheet metal working machinery, has bought the business of I. Blumberg & Co., which will be enlarged and continued.

* * *

The Worthington Pump & Machinery Corp. has taken over the Epping-Carpenter Pump Co., Pittsburgh, the plant of which hereafter will be known as the Epping-Carpenter works of the Worthington Pump & Machinery Corp.

* * *

Chandler Motor Car Co. directors have declared a 6 per cent quarterly dividend placing the stock upon a 24 per cent annual basis. They have also passed a resolution authorizing stockholders to be given three shares of new no par value stock for every share of the old issue held. It was also recommended unanimously that the existing authorized capital of 100,000 shares be exchanged for an authorized capital of 300,000 shares without nominal or par value.

Reduced Supply

Continues in Coal By-Product with Deliveries Carefully Regulated

New York, Oct. 6.—With improvement in the steel strike stiuation, deliveries of benzol are becoming somewhat better. Nevertheless, production still is well under normal, and dealers are exercising the utmost care in doling out their supplies. Despite the present tight situation, prices are unchanged. This may be accounted for in part by the fact that the consensus of opinion is that the present curtailment of production will be of short duration. The market on pure benzol is quoted at 24 to 29 cents, producers' plant, for spot and contract orders, and 90 per cent at 22 to 24 cents. Toluol and solvent naphtha, also affected by the strike, are scarce, with prices very firm at 25 to 30 cents and 22 to 27 cents, respectively.

Naphthaline continues active. The dye industry is a good buyer and drug trade is buying more heavily on its next year's requirements. At present there is little spot material available. Virtually all of the larger sellers, are sold up five and six weeks in advance, this being especially true of flakes. Contracting for next year is being done at the existing levels of 6½ to 7½ cents for flakes, and 8½ to 9½ cents on balls. The spot market is the same.

Although the foreign movement of sulphate of ammonia continues good, actual buying for export is not large. This fact is accounted for in part by the scarcity of spot supplies. Several sizable inquiries are going begging for this reason. The market on what little spot material there now is available is around $3.40 to $3.65. Contract material is held at $3.25 to $3.40.

Coke Oven By-Products

Obituaries

PHILIP HAMILTON McMILLAN, president of the Detroit & Cleveland Steam Navigation Co., Detroit, who died at his home at Grosse Point, that city, Oct. 5, from heart disease, was at one time president of the Detroit Seamless Steel Tubes Co., and vice president of the Michigan Malleable Iron Co., Detroit. At the time of his death he was vice president of the Detroit Free Press Co., and vice president and treasurer of the Packard Motor Car Co. He was one of the most prominent financial and industrial figures in Detroit, where he was born in 1872. Mr. McMillan obtained his education at Phillips academy, Andover, Mass., and later received the degree of A. B., at Yale. He also studied law at the Harvard law school. He first practiced law in New York City from 1897 to 1898 and the following year removed to Detroit. For about six years he was engaged in the general practice of his profession but in recent years his many corporate connections have demanded most if not all of his time.

Arthur J. Storm, New York representative of the Dayton Foundry Co., Dayton, O., died of heart disease on Sept. 23 at his home in Flatbush, Brooklyn. Mr. Storm was 46 years of age.

Charles Joseph McMyler, who for many years has been a director of the McMyler-Interstate Co., Bedford, O., crane and heavy equipment manufacturer, died Sept. 23 at his home in Cleveland Heights, Cleveland, of heart disease. Mr. McMyler was a son of John McMyler, founder of the McMyler company and retired from active participation in its business about three years ago.

Capt. Wesley C. Richardson, perhaps the oldest manager of lake vessels and one of the best known men connected with the trade, died at his home in Cleveland, on Oct. 2, at the age of 80. For over 50 years he had been closely identified with Great Lakes activities. For 15 years from 1880, he traveled for Briggs, Hathaway & Garretson, Cleveland, wholesale grocers, and in 1895 became a member of the firm of H. J. Webb & Co., vessel brokers and managers. Upon the death of Mr. Webb, the company's name was changed to W. C. Richardson & Co. Capt. Richardson also was head of a number of companies which operated about 15 vessels on the lakes and he also was a manager of a number of other bulk freighters.

Col. H. A. Marting

an Appreciation by

James A. Green, President
The Matthew Addy Co., Cincinnati, O.

COL. H. A. MARTING, president of the Marting Iron & Steel Co., who died Sept. 27, was born Sept. 17, 1850, being a native of Greenup county, Kentucky. His parents, however, removed to Scioto county Ohio, when he was a babe, and Colonel Marting's entire life and business activities were spent in southern Ohio. He grew up a boy on a farm, receiving the education which Ohio farmers' sons received in the fifties and early sixties of the last century. He had remarkable enterprise and imagination; he was not born to be circumscribed by the limits of the farm. He saw the commercial possibilities that lay about him, and his initial business enterprise was cutting ties for the railroad which ran up the Scioto valley. This proved a success, and almost as a boy opened a general store at Gepharts station. His active and restless spirit demanded a larger sphere of activity, and in 1873 he moved his store to Ironton, O. At that time a rolling mill was operated in Ironton which had had a checkered career. Colonel Marting retired from his mercantile business and purchased this rolling mill, forming the Eagle Iron & Steel Co., which later on was absorbed by the Republic Iron & Steel Co. The Eagle venture was remarkably successful. It demonstrated beyond any question Colonel Marting's remarkable ability and his genius for management. The period in which he operated the plant was not better or worse than the period in which the plant had lost money hand over fist for its owners, but with Colonel Marting at its head it proved to be a veritable gold mine.

The large return from the Eagle Iron & Steel Co., placed him in a position to purchase what was locally known as the "Big Aetna" property. This was a furnace which had been built on the bank of the river, and which inaugurated some new ideas. At the time it was constructed it was the largest stack in America, but it had never been operated successfully. This was the beginning of the Marting Iron & Steel Co., which since has absorbed the Lawrence Furnace Co. and the Ironton Iron Co., with a daily output when all stacks are blowing of 1000 tons. The Marting Iron & Steel Co. today is one of the soundest and most progressive independent furnace companies in America.

Colonel Marting was not a believer in placing all his eggs in one basket. He was interested in practically every industry in Ironton, and at his death he was director and a large stockholder in more than 25 business enterprises in his home city. He took an immense pride in putting Ironton, as it were, "on the map." His last public service was to build the Hotel Marting. Ironton for a long time had lacked proper hotel accommodations. Colonel Marting was the main spirit in forming a company which has just completed a hotel which is thoroughly modern and which would be an ornament to any city five times the size of Ironton.

He was a devoted member of the Methodist church, and was a liberal donor to the charities of that denomination. But he was not narrow-minded in his philanthropy, as his gifts to causes needing assistance were not bounded by any mere church lines. Colonel Marting was the soul of generosity, and one of his friends told the writer that he was the only man he ever knew who would borrow money in order to make a contribution for some deserving cause.

Success did not in any way spoil him; he was always the same humble, unassuming, approachable man that he was at the beginning of his career. He was easily the first citizen not only of Ironton, but of that part of southeastern Ohio. He had achieved a most conspicuous business success, and more than that, by his goodness and openhanded generosity he had endeared himself to his fellow citizens. In losing him Ironton particularly has suffered an immense loss, and the iron trade has lost one of its leading figures.

His career reads like a romance, and it is a modern romance for a farmer's boy to rise from the farm, without any advantage except the advantages of the opportunity which America offers, and to attain to the truly great and remarkable heights of success at which Colonel Marting arrived.

Some Tool Buyers Defer Action

Business of Equipment Sellers in West is Not Seriously Affected by Steel Strike—From Pittsburgh East, However, More Orders Are Held up—Newark, O., Stove Manufacturer Issues Large List

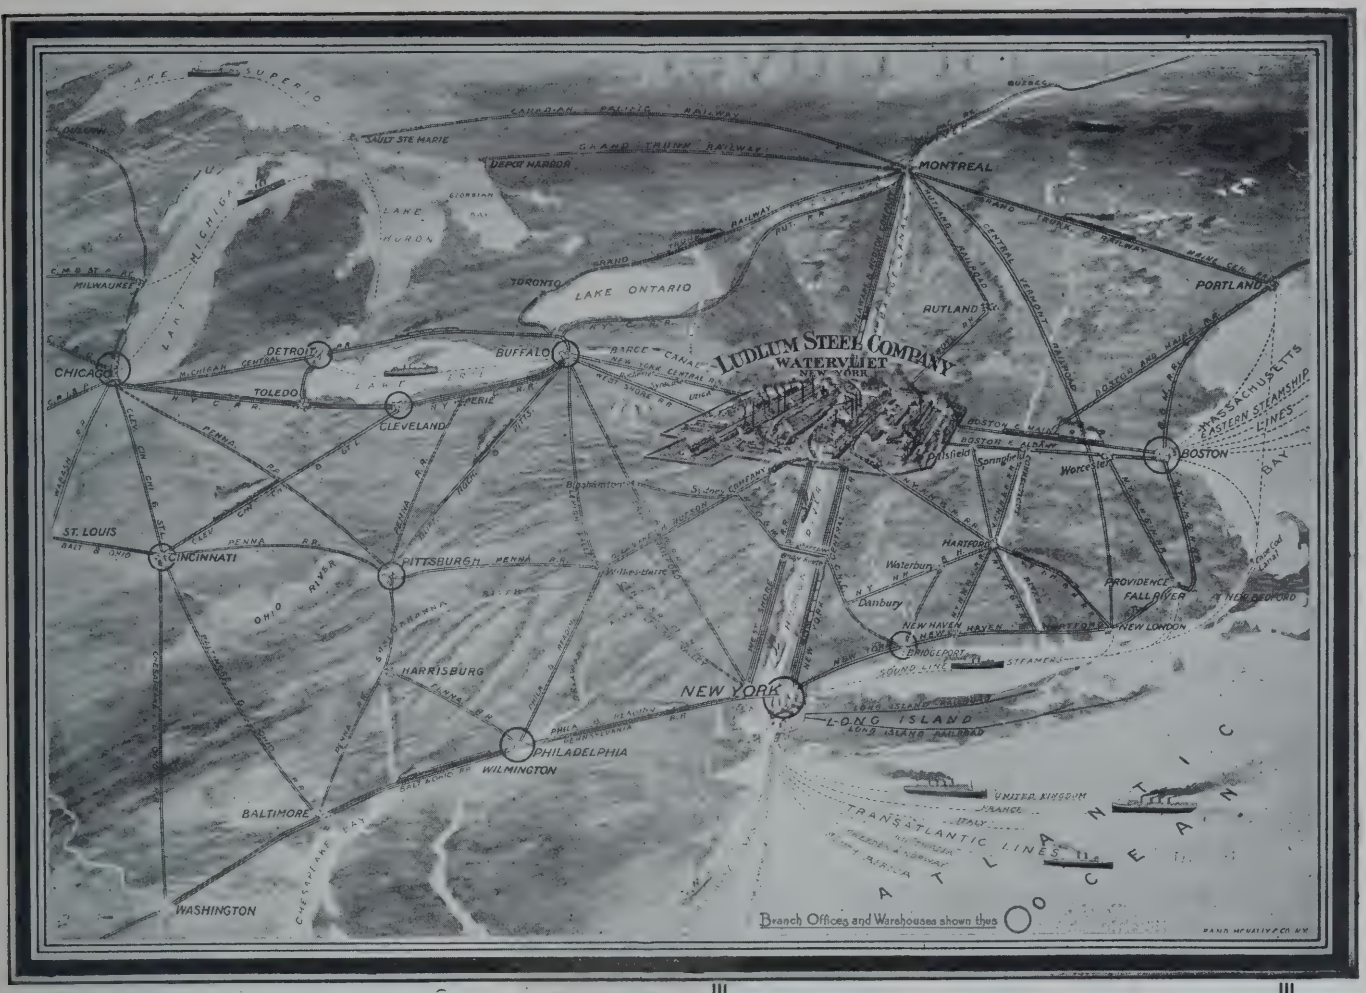
ADMITTING of some interruption of their business by the steel strike, machine tool dealers still find the current demand sufficiently heavy to keep them busy. The flow of inquiries in the Middle West is practically unhindered and sellers take courage as they view much evidence of big business under the surface ready to come forth when the air has been cleared of labor disturbances. As a deterrent the strike has been more effective in the east than anywhere else, however, although inquiries and orders for single tools or small lots are placed from time to time. In Pittsburgh many of the steel companies had entered or had given notice they would enter the market for equipment and action in these connections has been deferred. In the Cleveland, Dayton and Detroit territories much business continues to come from the automotive industries, although one of the largest lists of the week is issued by a stove manufacturer, the Wehrle Co., Newark, O. It calls for 26 machines. Another fair sized list comes from the Ohio Colleries Co., Toledo, O. The American Steel & Wire Co., Cleveland, and several Akron companies have postponed action on tool requirements until the strike is settled. Several inquiries for tools and cranes are being received from Canadian companies.

With inquiries and orders being received on a restricted scale in the east, tool manufacturers in the vicinity of Boston, report a larger inquiry from textile machinery manufacturers. Dealers in New York are working upon several tentative export inquiries. The largest is from C. H. Coulier, New York City, for about 125 machine tools as well as eight cranes. Other inquiries for shipment abroad are current.

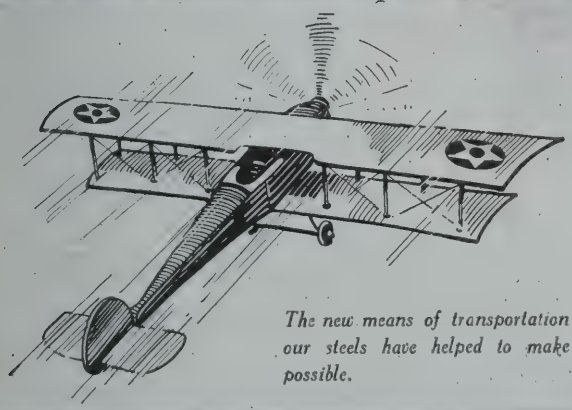
Companies who purchased cranes recently, include the Cerro de Pasco Copper Co., New York, which bought four and is inquiring for two more; the National Silk Mills, New Bedford, Mass., the Duquesne Light Co., Pittsburgh; the Standard Oil Co., Providence, R. I.; the Sligo Iron & Steel Co., Connellsville, Pa., the Niles Forge & Mfg. Co., Niles, O.; the Youngstown Boiler & Tank Co., Youngstown, O., and the McKinney Steel Co., Cleveland.

The largest locomotive crane inquiry current in the east is one for five cranes from the Hugh Nawn Contracting Co., New York City. The E. W. Bliss Co., Brooklyn, N. Y., has not as yet bought the two cranes it requires for Hastings, Mich., and in Pittsburgh, inquiries on which no action has been taken come from the Cambria Steel Co., Johnstown, Pa., and the Carnegie Steel Co., for its Homestead and Edgar Thomson plants.

Business from diversified sources is rolling up a heavy total in Chicago, where the railroads are making up their lists, against the time when they shall be returned to private owners.



Strike Restricts Machine Tool Inquiry in East



MACHINE tool inquiry in the east continues restricted. Orders for one and two tools are being taken in fair volume, but new inquiry is light. Demand is expected to improve as the steel strike situation grows better. In Boston, some of the larger manufacturers already report a larger volume of inquiry, especially from the textile machinery manufacturers. There is also some export inquiry, but this is slow in materializing into actual business. One of the larger export inquiries now out is that of C. H. Coulier, 25 Church street, New York, calling for about 125 machine tools. It is understood, however, this inquiry is of a tentative character.

Steadiness characterizes the eastern crane market. Inquiries are fairly numerous, and orders are being placed with regularity. Included in recent contracts are two cranes, of 30 and 50 tons capacity, respectively, for McIntosch & Seymour, Auburn, N. Y., and a 5-ton overhead crane for power plant for the National Silk Mills, New Bedford, Mass. Both of these orders were placed with the Northern Engineering Works, the latter by J. G. White Engineering Co., 43 Exchange place, New York City. Dwight E. Robinson & Co., 61 Broadway, New York City, placed a 75-ton overhead crane for the Duquesne Light Co., Pittsburgh. It is reported that this business went to the Morgan Engineering Co. The Cleveland Crane & Engineering Co. was awarded a 40-ton overhead crane by the Standard Oil Co. of New York for Providence, R. I. Pawling & Harnischfeger have been awarded four cranes by the Cerro de Pasco Copper Co. Specifications of these cranes follow: Two 15-ton cranes, 48-foot span; one 10-ton, 58-foot span; and one 10-ton, of 38-foot span. The copper company now is inquiring for two 15-ton overhead cranes.

Other inquiries current include a list for export by C. H. Coulier, 25 Church street, New York. The list comprises one 10-ton crane, with 30-foot span; one 5-ton, with 30-foot span; one 5-ton, with 25-foot span; one 10-ton crane, with 40-foot span; two 30-ton cranes, with 60-foot span; and two jib cranes, of two and three tons capacity, respectively. James Leffel & Co., 39 Cortlandt, New York, is inquiring for one 5-ton, one 10-ton, and one 20-ton overhead crane. These are also for export. Another export inquiry is that of the Rogers Keller Co., 39 Cortlandt street, New York, calling for a special overhead crane for Brazil.

is that of the Hugh Nawn Contracting Co., Forty-third street and Fifth avenue, New York. The list involves five cranes, of 15 and 20 tons capacity. The Atlantic Gulf & Pacific Co., Brooklyn, has purchased a used 5-ton Brown hoist crane.

Pittsburgh Trade Marks Time

IN Pittsburgh, the market for machinery and tools continues to mark time as far as new business is concerned. A large amount of business is in prospect, but since a large part of it is with steel and allied manufacturing interests, the tendency is general to withhold the orders pending the termination of the present labor disturbance. The Cambria Steel Co., Johnstown, Pa., some time ago put out inquiries for a number of cranes and other equipment in connection with the rehabilitation and extensions of its plant, but with operations suspended by the strike, new equipment orders have been deferred. Inquiries for cranes put out some time ago by the Carnegie Steel Co., for its Homestead and Edgar Thomson works have yet to be closed. The Pittsburgh Crane & Equipment Co., Pittsburgh, recently took orders for cranes from the Sligo Iron & Steel Co., Connellsville, Pa., the Youngstown Boiler & Tank Co., Youngstown, O., and the Niles Forge & Mfg. Co., Niles, O. New demands for machine tools have been rather few lately, but builders have a fair amount of orders on their books.

Dealers Busy; Admit Business is Held Up

EQUIPMENT sellers in the Cleveland district report no let up in the number of inquiries being received, although there is some withholding of orders. It is universally believed that were the labor and peace treaty situations cleared up, considerable business would be placed. The American Steel & Wire Co., one of the Cleveland concerns to be hard hit by the steel strike, will not place its orders for a sizable list of machine shop equipment until labor conditions become more stabilized. Some of the Akron companies which recently entered this market, have postponed their purchases, although no reason is given. These include the Firestone Steel Products Co., and one or two garage companies. It is understood that the Goodyear Tire & Rubber Co. has closed on practically all of its requirements, however, and the B. F. Goodrich Co. has made several purchases, including a No. 27 universal slotting shear, punch and bar cutter with 30-inch throat, with capacity for 1-inch plates. The Goodrich company now is looking for a 5-horsepower electric grinding machine.

Other recent purchasers include the White Motor Co., Cleveland, which continues to buy from time to time; the F. B. Stearns Co., that city, which has not yet closed on all of its requirements; and the Columbia Axle Co., also of Cleveland, which still is looking for some equipment. The McKinney Steel Co., Cleveland, has bought two electric cranes for Ironton, Mich.

One of the largest lists being acted upon by Cleveland dealers, comes from the Wehrle Co., Newark, O., stove manufatcurer. The list calls for two 14 or 16-inch x 8-foot engine lathes; one each No. 3 universal and one No. 2 plain milling machine; two 10-inch swing universal tool grinders; one 16-inch swing plain drill press; one 20 or 22-inch shaper; one 24 or 26-inch engine lathe with hollow spindle; one 54-inch diameter, horizontal surface grinder; one back-geared No. 94-D Toledo press with 6-inch stroke; one 4-foot radial drill; one 222-volt direct current electric polishing lathe, 7 to 8 horsepower; one 10-wheel polishing machine; one 30 or 32-inch band saw, band wheel to take 16 or 18 2-3-foot saws; two 2-ton Yale & Towne triplex chain blocks, 10-foot lift; one each 300, 600 and 2000 cubic foot air compressors on 100-pound pressure direct connected to gas engine; four 24 or 30-inch x 36 or 48-inch round exhaust tumbling barrels; one centrifugal oil separator; and one electric steel industrial truck. A fair sized list is issued by the Ohio Collieries Co., 721 Ohio building, Toledo, O. It calls for one 500 to 750-pound steam hammer; one No. 2-A Milwaukee or No. 3 Cincinnati milling machine; one 20 or 22-inch engine lathe with 12 or 14-foot bed; one 36 or 40-inch triple-geared engine lathe with 16-foot bed; one 36 x 36-inch x 10-foot planer. The Lockport Auto Radiator Corp., 291 Market street, Lockport, N. Y., wants stamping presses, spot welders, and other small tools.

Smaller inquiries for one or two tools are frequent and come from diversified industries. The American Chain Co., Bridgeport, Conn., wants a 14-inch lathe and a 60-ton toggle press, new or used. The Babcock & Wilcox Co., Barberton, O., is looking for one 1100-pound single frame hammer, through the Chambersburg Engineering Co., Chambersburg, Pa. The Auto Specialty Mfg. Co., St. Joseph, Mich., which is building a machine shop 80 x 140 feet, is seeking some miscellaneous equipment. The Eberhard Mfg. Co., Canton, O., wants a small lathe and the Winston-Dear Co., Hibbing, Minn., is endeavoring to locate a lathe for turning down 43 to 55-inch locomotive tires and for hoisting and intermediate shafts. The H. P. Deuscher Co., Hamilton, O., wants core room and foundry cranes.

Several Canadian companies are endeavoring to buy equipment in Cleveland. These include the Canadian Fairbanks Morse Co., Montreal, Que., which is taking quotations on shears with 36-inch throat and 1¼-inch capacity; William & J. G. Greey, 6 Church street, Toronto, who desire a new or second hand vertical boring mill, 72 or 84-inch diameter with double heads and five feet under cross head; C. P. Wilson, 509 Lumsden building, Toronto, is in the market for a 10-ton traveling and a 10-ton locomotive crane; G. W. Allan of Allan & McKelvie Engineering Co., Ltd., Vancouver, B. C., is looking for an open side planer and a milling machine. This company intends to manufacture saw mill machinery and equipment. The Chase Tractors Corp., Ltd., Toronto, will issue a sizable list a little later.

Building permits issued in September, 1919, aggregated $6,285,625 and numbered 1217, as compared with 843 permits issued in September, 1918, with a value of $1,565,995. Many of these were industrial establishments which brought increased equipment business to sellers. The Cleveland Twist Drill Co., Cleveland, has plans for a 67 x 114-foot forge shop. The White Co., East Seventy-ninth street, that city, will erect a 2-story machine shop, 210 x 884 feet, and an addition to its main plant, 200 x 600 feet. The Chandler Motor Car Co. and its subsidiary announce they will spend $1,000,000 on additional buildings. The Fink Body & Fender Co., 2075 East Sixty-fifth street, Cleveland, has plans for a 2-story plant to cost $60,000.

Other prospective purchasers of equipment in other territories include many companies in the automotive industry. The Cole Motor Car Co., Indianapolis, is to spend $1,000,000 on two 5-story buildings. The Indianapolis Body Corp., Indianapolis, will require equipment for a plant to make automobile bodies and accessories. The Elyria Steel Products Co., Elyria, O., will erect a plant 80 x 160 feet. The Hugo Mfg. Co., Warsaw, Ind., is capitalized at $1,500,000 and will require equipment to manufacture vacuum cleaners while the J. F. Rose Mfg. Co., Indianapolis, is to manufacture hand pumps. The Auto Equipment Co., Ft. Worth, Tex., is incorporated at $350,000 to make automobile parts and equipment.

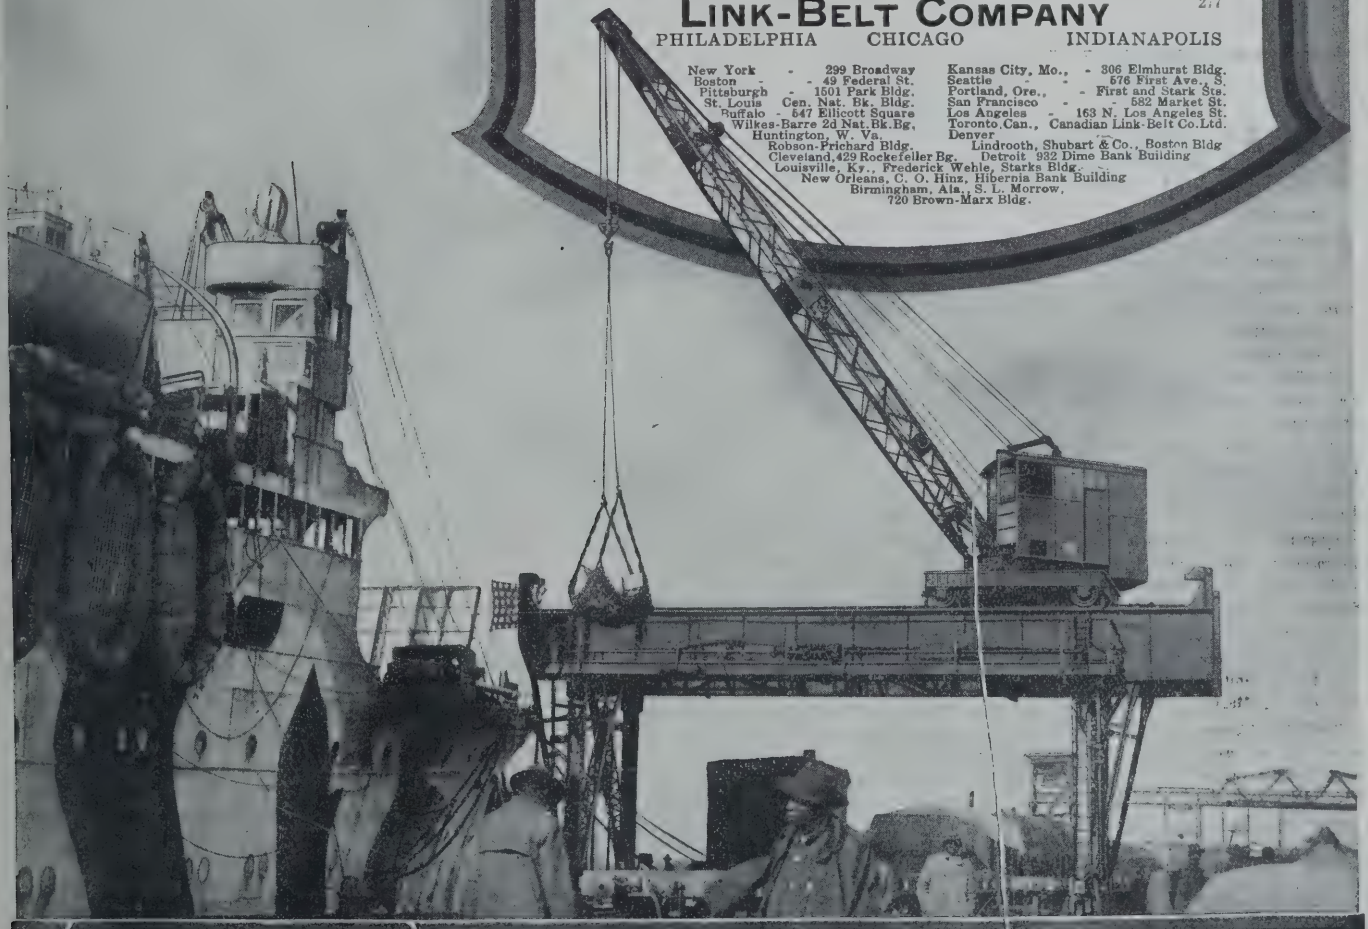
Heavy Railroad Buying Foreseen

CURRENT business from miscellaneous sources is bringing a heavy aggregate trade to all dealers in machine tool equipment in the Chicago district. As for the future, it holds promise of heavy business from railroads in 1920. With return of the roads to private ownership, slated for the end of this year, purchasing agents are

Link-Belt Cranes in France

JUST as Link-Belt Locomotive Cranes have served our country speedily unloading cargoes from the transports on the docks at France, so can they serve you.

For handling heavy materials; for storing coal; for storing and rehandling clinker, handling iron and steel, or switching cars, the Link-Belt Locomotive Crane is a useful and profitable machine around the yard. When not in use for the specific purposes for which it is purchased you will find there is always some other profitable work for such a machine to do.



We have developed out of years of experience a vast fund of knowledge about the handling of materials, which we shall be pleased to place at your disposal.

going over their requirements and outlining their lists with a view to placing them as early as possible to obtain the best delivery. These buyers have been out of the market for many months, although needs of railroad shops have been recognized and the further the situation has gone, the greater necessity there has been for adding to equipment. The Chicago & Northwestern railroad is inquiring for a few miscellaneous tools of no particular importance.

The Samson Tractor Co., at Janesville, Wis., continues to place orders for additional equipment for its new plant. This is a subsidiary of the General Motors Corp., and it is understood plans are now under way for building another plant in connection with the tractor interest for the manufacture of a 9-passenger automobile. This project has not become sufficiently definite to bring out its machine tool requirements. The Nash Motor Co. has started construction of its new plant in Milwaukee, but has not yet issued its list, although the inquiry is expected to be current within a short time. The Cary Equipment Co. of Milwaukee, has its new plant for the manufacture of concrete mixers well under way and has covered its tool buying. Recent advances have added about 12 per cent to the cost of radials and 15 per cent to planers.

The Moline Iron Works, Moline, Ill., will build a malleable foundry and an enameling shop. The Chicago Electric Mfg. Co. and the Sloan Valve Co., both of Chicago, have plans ready for new plants.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

WESTMINISTER STATION, VT.—The Abenaquet Machine Works has had plans prepared for a machine shop, 1-story, 150 x 500 feet, to cost $200,000.

ATTLEBORO, MASS.—The Mossberg Pressed Steel Corp. recently was incorporated with $325,000 capital, by Frank Mossberg, Sidney C. Bagney and Chester A. Van Der Pyl.

BOSTON.—The plant of the Underwood Machinery Co. recently was damaged by fire. The loss has been estimated at $100,000.

BOSTON.—The Reliance Machine & Specialty Co. has been incorporated with $15,000 capital, by James H. Duffy, Gerald N. Thaxter and Leonard Bartlett.

BOSTON.—The Commercial Metals Corp. has been incorporated with $500,000 capital, by William B. Nash, David M. Cook, Reading, Mass., Flavel Shurtleff and F. L. Mitchell.

BOSTON.—The Sherman Service, Inc., Cleveland, has been incorporated as an industrial engineer, with $1000 capital, by Fred J. Beck, W. N. Patterson, Everett, Mass., and F. S. Moore.

BOSTON.—Warren W. Scott, Inc., has been incorporated to make electrical fixtures and supplies with $40,000 capital, by Warren W. Scott, Holbrook, Mass., and Cyril E. Scott.

BOSTON.—The Johnson-McCarthy Corp. has been incorporated to make automobiles and motors with $10,000 capital, by Martin J. Thorsen, Allston, Mass., C. S. Johnson and Charles E. McCarthy.

CAMBRIDGE, MASS.—The Riverside Boiler Works has let the contract for a 2-story, 85 x 90-foot warehouse.

CHELSEA, MASS.—The Winnisimmet Ship Yard, Inc., has let the contract for a shipbuilding plant.

CLINTON, MASS.—The Spaulding-Herrmann Mfg. Co., Inc., has been incorporated to make tools, etc., with $2700 capital, by Charles H. Spaulding, Charles C. Herrmann and L. F. Spaulding.

GREAT BARRINGTON, MASS.—The Stanley Insulating Co. is reported planning a 2-story plant at a cost of $35,000.

LYNN, MASS.—The Davis Lynn Storage Battery Co., Commercial street, plans a plant addition, 1-story, 50 x 200 feet, to cost $35,000.

WILLIMANSETT, MASS.—G. Haarmann & Co., Inc., structural and ornamental steel and iron work, Holyoke, Mass., has a permit to build a 57 x 200-foot plant and a 40 x 42-foot office building at an estimated cost of $100,000.

PROVIDENCE, R. I.—The Brown & Sharpe Mfg. Co. has started on a foundry addition, 140 x 180 feet, to cost $165,000.

PROVIDENCE, R. I.—The Johnson Tool Co. has been incorporated with $50,000 capital, by Adolf E. Johnson, East Providence, R. I., Andrew E. Johnson and John L. Anderson.

PROVIDENCE, R. I.—The C. A. Wilkinson Co. has been incorporated to make metal products with $180,000 capital by Howard H. Wilkinson, Ralph A. Wilkinson and E. Butler Moulton.

BRIDGEPORT, CONN.—The Bridgeport Press Co. has let the contract to Levering & Garrigues, New York, for a 164 x 225-foot addition to its casting plant, to cost $150,000.

HARTFORD, CONN.—The plant of the New Britain Machine Co. will be removed to Watertown, Mass.

HARTFORD, CONN.—The Hartford Rubber Works Co. plans to expend more than $4,000,000 on new buildings and equipment.

MERIDEN, CONN.—The Cuno Engineering Corp. will build a plant.

NEW BRITAIN, CONN.—The Fafnir Bearing Co. will build a 36 x 96-foot plant addition.

NEW BRITAIN, CONN.—Landers Frary & Clark have completed plans for a 6-story factory building, 120 x 300 feet.

NEW BRITAIN, CONN.—The American Foundry Co. has let the contract for a 60 x 260-foot with ells, 22 x 56 feet and 31 x 42 feet, foundry.

NEW BRITAIN, CONN.—The American Hardware Corp. has let the contract for a 5-story, 46 x 154-foot addition to the Corbin Cabinet Lock Co. plant, to cost $80,000.

NEW HAVEN, CONN.—The Aaron Electric Co., 999 Hawthorne street, is about to start on a plant addition, to cost $16,635.

NORWALK, CONN.—The Norwalk Ignition Co. has been incorporated to make spark plugs, accessories, etc., with $25,000 capital, by D. A. Whitehead, Carroll W. Prochaska, formerly of the Malleable Iron Fitting Co., and J. A. Mills.

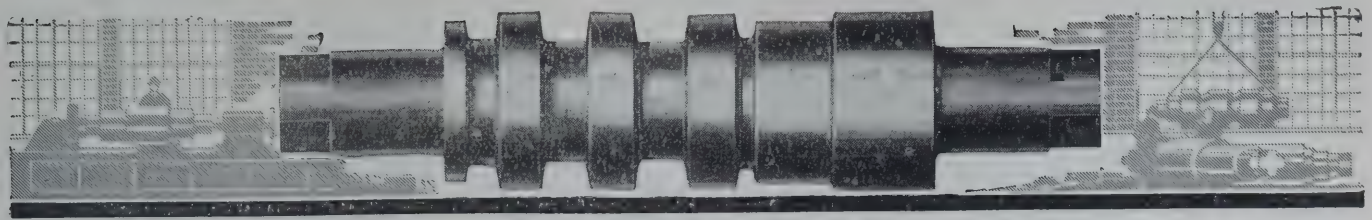
WATERBURY, CONN.—The American Brass Co. has let the contract for a 1-story, 88 x 420-foot with ells, 10 x 75-foot and 60 x 75-foot additions to cost $120,000.

WEST HAVEN, CONN.—The New Haven Machine Co., 179 Milford turnpike, will build a 2-story, 44 x 100-foot machine shop at an estimated cost of $25,000.

North Atlantic States

AMENIA, N. Y.—The Amenia Electric Light & Power Co. has been incorporated with $25,000 capital, by E. J. Chaffee, L. F. Eaton and E. B. Thompson.

AUBURN, N. Y.—The Eagle Wagon Works has awarded a contract for a storage building, 1-story, 44 x 51 feet.



AUBURN, N. Y.—The Auburn Button Works, 48 Canoga street, has awarded a contract for a boiler and engine house, 1-story, 56 x 71 feet, to cost $10,000.

BINGHAMTON, N. Y.—The S. R. S. Auto Accessory Co. has been incorporated with $50,000 capital, by R. F. and G. C. Rath and L. Sturdevant.

BROOKLYN, N. Y.—The Kings County Gas Appliance Co. has been incorporated with $10,000 capital, by T. J. Nisbet, 721 Forty-first street, and others.

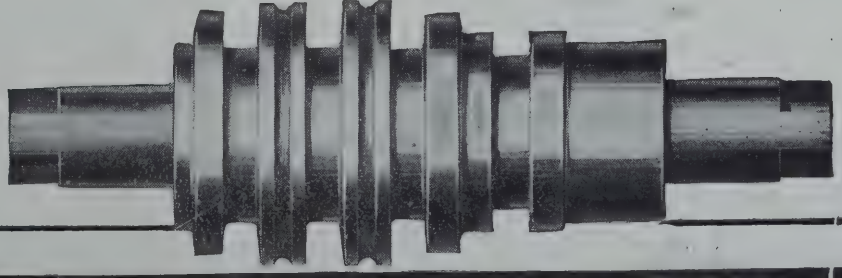
BROOKLYN, N. Y.—The Jensen Oil Engine & Machine Co. has been incorporated with $20,000 capital, by C. P. and C. and B. Jensen, 220 Wakeman place.

BROOKLYN, N. Y.—The Regal Machine Works,

Rolling Mill Jim Back from a Fishing Trip

Say, Fella's—

Just got back from a fishing trip, acted wise before I went tho'., put in Hubbard Rolls, knew they'd give no trouble; got back found things running fine.



So Long,

Rolling Mill Jim.—

Hubbard Steel Foundry Co.

EAST CHICAGO, IND.

All Kinds of Iron and Steel Rolls and Steel Castings.

Inc., cloth laying and cutting machinery, recently was incorporated with $20,000 capital, by C. Sussman, L. Cooper and N. Diamond, 41 Park Row.

BUFFALO.—J. H. Williams & Co., 400 Vulcan street, has awarded contracts for a boiler shop, 1-story, 28 x 48 feet.

BUFFALO.—The Bairy Machine Corp. has been incorporated with $50,000 capital, by W. H. Wilson, J. L. Kinney and B. G. Weber.

BUFFALO.—The Perfect Auto Lock Corp. has been incorporated with $125,000 capital, by F. E. Pond, A. A. Patrzkowski and F. G. Safee.

BUFFALO.—The Buffalo Nipple Machine Co., Inc., 335 Glenwood avenue, has had plans drawn for a plant addition, 2-stories, 32 x 76 feet, to cost $10,000.

CAYUGA COUNTY, N. Y.—The Northern Cayuga Light and Power Corp. has been incorporated with $50,000 capital, by C. E. Dudley, F. Longley and J. D. Bloomfield, Meridian, N. Y.

ELMIRA, N. Y.—The Willys-Morrow Co. has let the contract for a new plant.

ELMIRA, N. Y.—This city plans to issue bonds amounting to $5,000,000 for an addition to its waterworks plant.

FRANKFORT, N. Y.—The International Crusher Co. recently was incorporated with $10,000 capital, by G. M. Mitchell, M. A. Rause and P. H. Walsh.

HERKIMER, N. Y.—The Fulton Chain Construction Corp. has been incorporated with $10,000 capital, by C. H. and H. K. Vanauken and M. C. Tryon.

UTICA, N. Y.—The Economic Iron Works, Inc., recently was incorporated with $10,000 capital, by G. and C. M. Lorenz and F. G. King.

ROCHESTER, N. Y.—Josiah Anstice & Co., 220 North Water street, is contemplating a foundry, 200 x 300 feet, to cost $185,000.

ROCHESTER, N. Y.—The Rochester Automotive Equipment Corp. has been incorporated with $5000 capital, by G. L. Clark, W. A. Mine and L. R. Lewis.

SUFFERN, N. Y.—The Rocksange Iron Works, Inc., has been incorporated with $50,000 capital, by W. H. Pavitt, A. Grunewalk and M. Hineser, 2981 West Twenty-seventh street.

TROY, N. Y.—The Bossard Railway Signal Corp., signals, switches, etc., recently was incorporated with $50,000 capital, by W. E. Hamilton, Fonda avenue, M. J. O'Sullivan, 381 Division street, Amsterdam, N. Y., and J. L. Lehman Jr., 10 First street, Troy.

CARLISLE, PA.—J. F. Rogers Co. will erect a 1-story power plant, 45 x 80 feet.

CHESTER, PA.—Contracts have been awarded by the American Locomotive Co., for two plant extensions. One is for a machine shop, 60 x 350 feet, and the other a foundry building 175 x 600 feet.

EAST STROUDSBURG, PA.—The Metal Crafter contemplates a plant addition.

ELLWOOD CITY, PA.—The Beaver Clay Products Co. let the contract for a plant to cost $100,000.

ELLWOOD CITY, PA.—This city will build a garbage disposal plant.

ERIE, PA.—The board of water commissioners will build a reservoir.

FARRELL, PA.—This town has arranged for a bond issue of $24,000 for waterworks extensions.

LANCASTER, PA.—The E. T. Fraim Lock Co. plans a machine shop 44 x 82 feet.

MIDDLETOWN, PA.—The Wincroft Stove Co. has a site in Philadelphia and will build a plant to cost $100,000. E. N. Colquhor is in charge.

MONACA, PA.—This city plans a waterworks plant.

NORRISTOWN, PA.—The Valley Forge Magnesia Co., which is erecting a plant at East Valley Forge, has been incorporated with a capital of $125,000. The officers of the company include John P. DuBoise, secretary and George B. Hurdle, superintendent.

PHILADELPHIA.—The Albro-Clem Elevator Co., Erie street, has awarded contracts for a 1-story, 78 x 118-foot machine shop to cost $13,000.

PHILADELPHIA.—At a cost of $475,000, R. H. Wood & Co. will erect a 5-story, 100 x 250-foot building and a 2-story, 78 x 79-foot building. In addition, the company will erect a small addition to its forge shop.

PHILADELPHIA.—T. S. Johnson & Sons, 622 Cherry street, is reported planning to build a 2-story, 45 x 60-foot plant for the manufacture of sheet metal material and heating products.

PHILADELPHIA.—The Belmont Iron Works has been awarded a steel contract for a machine shop addition, 100 x 200 feet, by the Newton Machine Tool Co.

PITTSBURGH.—The Oliver & Snyder Steel Co. will build a boiler house 44 x 64 feet.

PITTSBURGH.—The plant of the National Bolt & Nut Co. recently was damaged by fire. The loss has been estimated at $100,000.

SHARON, PA.—Taylor & Sons have the plans for the iron works of A. N. & Louis Rosenblum.

WILKES-BARRE, PA.—The Guarantee Steel Corp. is taking bids for a power house.

CLIFTON, N. J.—The Athenia Steel Co., Colfax avenue, plans a plant addition, 2-stories, 50 x 100 feet, to cost $20,000.

EDGEWATER, N. J.—A general contract for a $1,000,000 plant addition by the Aluminum Co. of America has been awarded to the Turner Construction Co., New York. The building will be L shaped, 81 x 450 feet with a wing, 80 x 176 feet.

ELIZABETH, N. J.—The Dussenberg Motors Corp. will begin work soon on the enlargement of its plant as a unit for the Willys Corp. The new plant will be used for the manufacture of automobiles.

HARRISON, N. J.—The Driver-Harris Co. has let a contract for a 3-story plant, 50 x 100 feet, to cost $50,000.

NEWARK, N. J.—The Colonial Stamping Co. will award contracts shortly for alterations to its plant.

NEWARK, N. J.—The Balbach Smelting & Refining Co., 580 Market street, has awarded a contract for a plant addition.

NEWARK, N. J.—A general contract for a boiler house, 38 x 45 feet, for George Stengel, Inc., has been awarded to O'Rourke & Briscoe, as architects, to C. J. Shubert Sons.

NEWARK, N. J.—Henry J. and John V. King, have completed plans for a 48 x 100-foot building for the Die Casting Co., Irvington, N. J.

NEWARK, N. J.—The American Platinum Works, 231 New Jersey Railroad avenue, has awarded contracts for a factory and boiler house.

NEWARK, N. J.—The New Toy Co., 200 Fifth avenue, New York, has awarded contracts for a factory and chemical building.

NEWARK, N. J.—The Tanners Machinery Co., 31 Clinton street, has been incorporated with $100,000 capital, by Ralph G. Steinhardt, Lawrence J. Steinhardt and others.

PLAINFIELD, N. J.—The American Motors Corp. is contemplating a plant at Hartford, Conn.

WILMINGTON, DEL.—The Lobdell Car Wheel Co. is about to start work on an addition, 1-story, 52 x 65 feet, to cost $16,000.

BALTIMORE.—The Baltimore Spring Works will build a 3-story addition.

BALTIMORE.—The Baltimore Tube Co. has let the contract for a 1-story plant 75 x 144 feet to cost $25,000.

BALTIMORE.—Hill & Ferguson, 112 East Nineteenth street, New York, have the plans for a waterworks plant here.

BALTIMORE.—A 2-story factory building, 53 x 102 feet, costing $40,000 will be erected here by the Consolidated Gas, Electric Light & Power Co.

BALTIMORE.—With a capital of $400,000, the Robeison Co. has been incorporated to manufacture packing and sealing machinery. Joseph P. Murray and Frank S. Muzzey, of Philadelphia, and Theresa Schneider, of Gibbstown, Pa., are the incorporators.

ELKTOWN, MD.—This town plans to spend $80,000 for improvements to its waterworks plant. Wm. L. Mackhall is president of the water board.

ROANOKE, VA.—The Roanoke Consolidated Iron Corp. recently was incorporated with $350,000 capital.

Central States Activity

EDGERTON, WIS.—The Continental Axle Co. is taking bids for a plant, 1-story, 58 x 290 feet, to cost $70,000.

EDGERTON, WIS.—The Edgerton Barn Equipment Co. is purchasing a number of items of new machinery and has contracted with the Rock River Machine Co., Janesville, Wis., for a large shear and punch press.

KEWASKUM, WIS.—Foundations for a 1-story aluminum goods factory, 100 x 200 feet, will be laid before winter by the Kewaskum Aluminum Co., a new $150,000 corporation. A. L. Rosenheimer is president.

LA CROSSE, WIS.—The Matthews Mfg. Co., Cleveland, O., is reported contemplating a branch here. The original investment will be about $70,000 in factory and machinery.

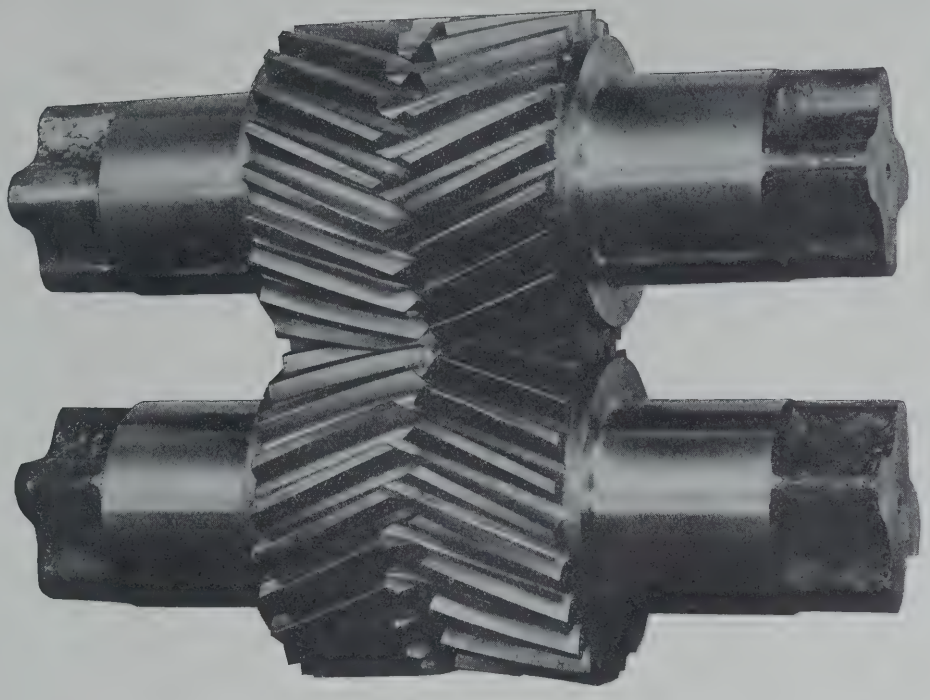
MANITOWOC, WIS.—The Tinsel Mfg. Co. has acquired the business and equipment of the National Toy Mfg. Co., Milwaukee, and is moving the plant to this city, where a 3-story, 60 x 120-foot addition has been completed.

MILWAUKEE.—C. D. Eising, 2221 Wells street, is having plans prepared for a 1-story building, 50 x 150 feet.

MILWAUKEE.—The Newport Co., a recent consolidation of the Newport Chemical Co., the Newport Hydro-Carbon Co. and others, will build a chemical laboratory at its main works in Carrollville, Wis., at an estimated cost of $100,000.

MILWAUKEE.—J. M. Nash, 842 Thirtieth street, plans a machine shop, 2-stories, 30 x 125 feet, to cost $75,000.

MILWAUKEE.—The A. O. Smith Corp., pressed, stamped, forged and machined automobile parts, is reported planning to double the size of its plant.



MILWAUKEE.—The Koehring Machine Co., concrete mixers, etc., has been granted a permit to erect a power plant addition, 51 x 71 feet, to cost $25,000.

MILWAUKEE.—The David White Co., 419 East Water street, surveying instruments, has increased its capital from $25,000 to $50,000 and will enlarge its facilities.

MILWAUKEE.—The Milwaukee Shaper Co. has increased its capital from $75,000 to $150,000 for the purpose of doubling its production. The company has leased 25,000 square feet.

MILWAUKEE.—The Worden-Allen Co. has the contract to fabricate and erect the steel for a 1-story factory and power house, 135 x 475 feet, for the Edmonds Shoe Co. The factory and necessary equipment will cost about $250,000.

MILWAUKEE.—The W. S. Seaman Co., 480 Virginia street, manufacturer of automobile bodies, has reincorporated its business as the Seaman Body

Corp., with a capital of $150,000. Enlargement of plant and equipment is planned.

MILWAUKEE.—The Kahn Mfg. Co. has been incorporated with a capital of $150,000 to manufacture spark plugs, ignition devices and other accessories. August Haberer, Edward Wagenknecht and Albert Brandenberg are the incorporators.

MILWAUKEE.—The Seaman Body Corp. recently was incorporated with $120,000 capital, to manufacture automobile bodies and parts. The incorporators are Harold and Irving Seaman of the W. S. Seaman Co., Milwaukee, manufacturer of automobile bodies.

MT. VERNON, O.—The plant of the Mt. Vernon Foundry Co. will be enlarged according to a current report.

RACINE, WIS.—This city contemplates expending $500,000 in enlarging its waterworks plant.

RACINE, WIS.—The Ajax Auto Parts Co., Fifteenth street, is completing plans for a 1-story machine shop addition, 65 x 120 feet.

ST. LAWRENCE, WIS.—Gehl & Wendt, machinists and automobile dealers, plan a shop addition, 65 x 70 feet.

WAUPACA, WIS.—Plans for a 1-story machine shop and assembling room for the Stewart Tractor Co. are being completed.

WEST BEND, WIS.—The West Bend Equipment Co., maker of steel devices and appliances for farms and shops, has let contracts for a 2-story plant addition, 80 x 100 feet, to cost $30,000. A. H. Klumb is president.

PORTLAND, IND.—The Guedel Mfg. Co., capitalized at $50,000, has been chartered to manufacture automobile parts by M. G. Bimel, H. B. Guedel and W. M. Guedel.

TERRE HAUTE, IND.—The machine shops at the plant of the American Car & Foundry Co. were damaged by fire with a loss of $100,000. Rebuilding will be started immediately.

AKRON, O.—The Firestone Steel Products Co. has awarded contracts for a 1-story, 100 x 200-foot plant to cost $500,000.

BARNESVILLE, O.—This city contemplates a power house at the municipal water works.

CINCINNATI.—The Pfau Mfg. Co. is having plans drawn for a foundry, 50 x 225 feet, to cost $45,000.

CLEVELAND.—The Anderson Rolled Gear Co. recently was incorporated with $5000 capital, by H. N. Anderson and others.

CLEVELAND.—The Automotive Service Co. has been incorporated with $200,000 capital, by Cambie C. Silverthorn and others.

CLEVELAND.—L. Malewitz, Waterloo road, plans a 2-story, 75 x 90-foot plant for the manufacture of metal stamping products, to cost $30,000.

CLEVELAND.—The Austin Co., engineer, has been awarded a contract to erect a foundry for the Burd High Compression Ring Co., Rockford, Ill.

CLEVELAND.—The Ohio Foundry Co., 9806 Quincy avenue, recently awarded contracts for an addition, 49 x 49 feet, to cost $10,000.

CLEVELAND.—The Cleveland Twist Drill Co., 4727 Hamilton avenue, has had plans prepared for a 1-story, 67 x 114-foot forge shop to cost $20,000.

CLEVELAND.—The Fink Body & Fender Co., 2075 East Sixty-fifth street, is having plans prepared for a plant, 2-stories, 62 x 101 feet, to cost $60,000.

CLEVELAND.—The Electric Smelting & Aluminum Co. recently was incorporated with $10,000 capital, by Charles P. Hine, 1239 Engineers building, and others.

CLEVELAND.—The Consolidated Iron Steel Mfg. Co. has been incorporated with $1,812,500 capital, by A. V. Cannon, 1414 Williamson building, and others.

CLEVELAND.—The Holam Mfg. Co., 4011 Clark avenue, manufacturer of light metal stamping products, recently awarded contracts for a 2-story, 80 x 116-foot plant to cost $40,000.

CLEVELAND.—The R. F. Carpenter Mfg. Co., 984 East Sixty-fourth street, manufacturer of metal doors and partitions, is reported contemplating a 1-story, 60 x 100-foot plant, addition to cost $20,000.

CLEVELAND.—Announcement has been made that the Chandler Automobile Co. and the Cleveland Automobile Co., a subsidiary of the former concern, have awarded contracts for extensive plant additions.

CLEVELAND.—The White Motor Car Co., East Seventy-ninth street, plans a 2-story, 210 x 884-foot machine shop to cost $175,000. The company also plans a 1-story, 200 x 600-foot addition to its main plant at a cost of $600,000.

CLEVELAND.—The National Copper & Smelting Co., care of Frank G. Carpenter, 804 Illuminating building, is reported contemplating a plant here at an estimated cost of $100,000. Actual construction is not expected to begin before the first of next year.

CLEVELAND.—The Ohio Trailer Co. at a recent meeting of stockholders, decided to change its name to the Ohio Motor Vehicle Co., and will increase its capital from $300,000 to $1,000,000. The company plans to manufacture a six-cylinder automobile. Charles A. Riegler is president.

DAYTON, O.—The Eureka Tool & Die Co. recently was incorporated with $12,000 capital, by L. O. Shank and others.

DAYTON, O.—The Dayton Metal Products Co. recently increased its capital from $200,000 to $6,000,000. It is erecting two plant additions.

ELYRIA, O.—The Elyria Welding Co. has been incorporated with $5000 capital, by Charles G. Beardslee and others.

ELYRIA, O.—The Elyria Steel Products Co. has purchased 26 acres on which it plans a plant, the main building to be 80 x 160 feet. D. Miller is president.

KENTON, O.—The Ohio Machine & Tool Co., 830 South Leighton street, has awarded contracts for an addition to its machine shop, 1-story, 41 x 80 feet.

LORAIN, O.—The Hoffman Heater Co. has let contracts for a plant, 1-story, 96 x 300 feet, to cost $40,000.

MT. VERNON, O.—The sale of $10,000 of additional stock for enlargements to its plant, has been effected by officers of the Mt. Vernon Foundry & Engineering Co. The plans call for a building at an estimated cost of $20,000.

MT. VERNON, O.—The expenditure of between $300,000 and $500,000 in the construction and equipment of six additional buildings, is contemplated by the C. & G. Cooper Co., in which small gas engines will be manufactured. According to the report the plans call for a pattern storage building, 120 x 470 feet, an enlargement of the machine shop, construction of a cleaning room, 108 x 120 feet, erection of foundry building addition, construction of wood working shop and the construction of an erecting shop.

NILES, O.—The Youngstown Pressed Steel Co., 2131 Wilson avenue, Youngstown, O., has awarded contracts for a plant here, 1-story, 520 x 560 feet, to cost $600,000.

TOLEDO, O.—Work on the first unit of the proposed plant for the Toledo Machine & Tool Co. has been started. The plant will consist of a foundry, 153 x 378 feet, boiler building, 40 x 50 feet, power house and engine room, 40 x 55 feet, and a sand storage building, 20 x 200 feet. Henry J. Hinde is president and general manager.

LOUISVILLE, KY.—The Louisville Atomizer Fuel Co. has been organized with a capital of $200,000 by J. M. Denton and others and will build a plant to manufacture air appliances.

MOUNDSVILLE, W. VA.—The Cameron Tool Co. has let the contract for a new plant.

Business in Canada

MONCTON, N. B.—The city council plans improvements to its waterworks plant and system at a cost of $107,553.

SACKVILLE, N. B.—The Eastern Electric & Developing Co. will build an addition to its power house.

SUSSEX, N. B.—Buildings owned by the Wallace Machinery Works here were damaged by fire with a loss to buildings, machinery and patterns amounting to $25,000.

LOUISBURG, N. S.—J. W. Madden and W. N. MacDonald are interested in a syndicate which is preparing plans for a dry dock here.

CHARLOTTETOWN, P. E. I.—Bruce Stewart & Co., Ltd., Great George street, awarded the general contract to H. & S. Lowe, 240 Hillsborough street, for a machine shop to cost $45,000.

MONTREAL, QUE.—Paxton & Mitchell, Ltd., have been incorporated to manufacture and deal in iron, steel, metals, machinery, tools, etc., with $100,000 capital by Gordon G. Hyde, John G. Ahearn, Ronald C. Grant and others.

MONTREAL, QUE.—The M. E. Casey Co., Ltd., has been incorporated by Michael A. Phelan, Westmount, Que.; Charles G. Ogden, Charles S. LeMesurier and others of Montreal, with $50,000 capital to manufacture engines, motors, woodworking machinery, tools, etc.

BRANTFORD, ONT.—The Electric Tin Products Co. has a site here and an electric smelting system will be installed.

BRANTFORD, ONT.—The Brantford Oven & Rack Co. will build an addition and install machinery and equipment.

BRANTFORD, ONT.—Houlding & Walker, Ltd., have been incorporated with $100,000 capital by Reginald L. Houlding, Irwing Walker, Franklin L. Johnson and others to manufacture machinery, motors, etc.

GLENCOE, ONT.—The Hydro Electric Power Commission plans an electric lighting plant and system here to cost $12,000.

NORTH BAY, ONT.—The Wagar Furniture Co., Ltd., has been incorporated with $40,000 capital, to manufacture furniture, tin and metal products, etc., by Walter S. Wagar, Harvey A. Heavener, John Blanchet and others.

OJIBWAY, ONT.—Actual construction work is progressing on the plant of the Canadian Steel Corp. One foundation for a 600-ton furnace is now in and work has been started on a second.

TORONTO, ONT.—Plans are being prepared for alterations to old buildings and the erection of an addition to the plant of the Chase Tractor Corp., 28 Atlantic avenue.

TORONTO, ONT.—M. A. Cuming & Co., Ltd., has been incorporated to manufacture hatters' tools, etc., with $40,000 capital, by Wilfred Field, 157 Bay street, and others.

* * *

The Lake Superior Iron Ore association has moved its headquarters from the Perry-Payne building, Cleveland, to room 1001 Rockefeller building.

* * *

The Shawinigan Electric-Metals Co., Ltd., has moved its United States sales office from 932 Leader-News building, Cleveland, to 1500 Westminster building, Chicago. It also has arranged to carry stocks of magnesium in warehouses in New York, Chicago and Detroit. D. P. Falconer is sales agent.

* * *

Charles Morningstar & Co., Inc., of New York, is about to open an office in Kobe, Japan, under the management of I. Ninomiya.

* * *

The Albert P. Hill Co., Inc., Pittsburgh, advertising, has removed its offices from the Peoples Bank building to new and larger quarters. It now occupies the entire top floor of the building at 233 Oliver avenue.

* * *

The firm name of the L. Wolff Mfg. Co., Chicago, has been changed to the Wolff Mfg. Co., and the business will be continued with increased capital and facilities.

* * *

The Monel Metal Products Corp. is the new corporate style for the Bayonne Casting Co., Bayonne, N. J.

* * *

The name of the American Shell Co., Paterson, N. J., has been changed to the Gillespie Motor Co. Allied plants are the East Jersey Pipe Co., and the Gillespie Foundry Co., both at Paterson.

* * *

The purchasing department of the Charcoal Iron Co. of America, now located in Marquette, Mich., will be moved to Detroit about Jan. 1. R. F. Birchard will remain in charge of the company's purchasing.

* * *

The Stecker Electric & Machine Co. has moved into a new plant at Greenwood and Dewey avenues, Detroit.

* * *

Sprout, Waldron & Co., mill builders and furnishers, of Muncy, Pa., announce the opening of an office in Kansas City. H. C. Malsness is in charge.

* * *

The Poole Engineering & Machine Co., Baltimore, has opened a branch office in Boston in the Old South building, in charge of Robert W. Catlin.

* * *

The name of the Cochran Pipe Wrench Mfg. Co., Chicago, was changed on Oct. 1 to the Cochran Mfg. & Forging Co., without change in its management, to indicate more clearly the business in which it is engaged.

* * *

The Universal Rolling Mill Co., with plants at Bridgeville and Charleroi, Pa., recently changed its name to the Universal Steel Co. This company manufactures tool and alloy steel.

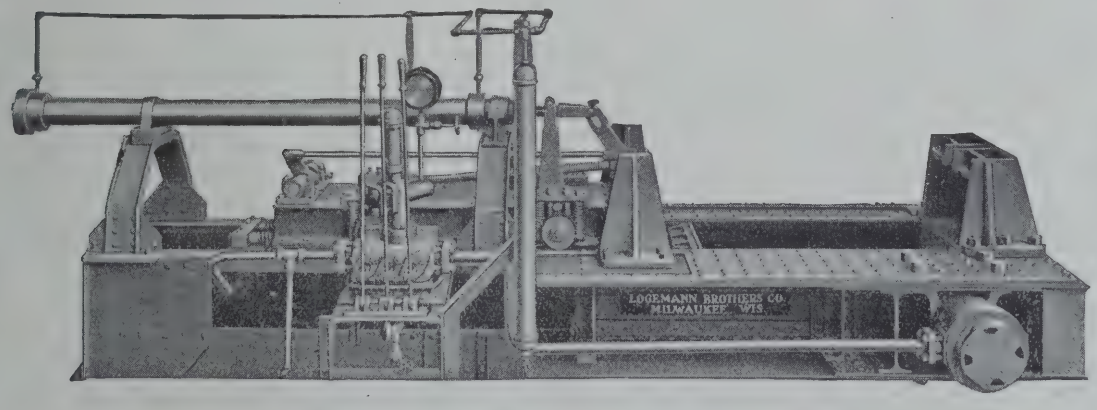
When the Scrap Market Is Dull

While seeking a more favorable market the best form in which to hold your sheet scrap, etc., and the form that always commands the best prices is the dense hydraulically compressed bundle.

Thus less storage space is required—under roof to prevent loss from corrosion; and because of greater car tonnage under minimum car rate, you add from 25% to 50% freight savings to your profits.



For greatest compression, largest daily output, at lowest operating cost, use

LOGEMANN Double Ram Hydraulic Scrap Metal PRESSES

You can enjoy the advantage of the accumulated experience from hundreds of Logemann scrap bundling presses now in use.

They embody a simplified mechanism that requires no special skill to operate rapidly. Press and pump are so designed that all the motive power applied is utilized, thus reducing power cost.

Powerfully built, all working parts constructed to resist the severest strains—selected material, first class workmanship—all minimize upkeep cost and insure lasting efficiency.

A medium sized press is shown; there are smaller and larger sizes in standard models.

Advise character and daily tonnage of your scrap and let us suggest press best suited to your requirements.

New Trade Publications

FINISHED PRODUCTS.—The St. Louis Screw Co., St. Louis, has issued its ninth catalog, an 80-page booklet in which specifications and other data, pertaining to the company's products are given. These products include, bar iron, screws, bolts, nuts, washers, etc. The booklet is well illustrated.

CORE OVENS.—Catalog No. 148 recently published by the Whiting Foundry Equipment Co., Harvey, Ill., is devoted to a description of core oven equipment in general. Ovens equipped with three types of doors are described and illustrated. Core oven racks, core makers' benches, puller machines, core oven cars and trucks, etc., are among the equipment described. Many of the illustrations are of actual installations.

LADLES.—The Whiting Foundry Equipment Co., Harvey, Ill., has published an illustrated booklet, in which crane ladles, truck ladles, slag truck ladles, bottom tap ladles, teapot spout ladles, shank ladles, trolley ladles, car wheel ladles and reservoir ladles, for use in modern foundries, are described and illustrated. Data given, includes construction, capacities and other specifications useful to persons interested in such equipment.

MACHINE EQUIPMENT.—An interesting booklet has been issued by Somers Fitler & Todd Co., Pittsburgh, containing a pictorial description of the company's warehouses and office departments. This is supplemented by a brochure on the officers, policy of the company and general information concerning the machinery and equipment in which it deals. The booklet is elaborate, is printed on heavy stock, and the illustrations are well presented.

MOTOR-DRIVEN TOOLS.—Bulletin No. 103, being circulated by the Stow Mfg. Co., Inc., Binghamton, N. Y., contains descriptions and illustrations of tools manufactured by the company. Those described are, heavy-duty drills, hand drills, portable drills, buffer and grinder, general utility tools, screw driver, flexible grinder, grinder for lathe carriage or tool post, etc. All are motor-driven. Specifications and other data concerning each tool is given.

ELECTRIC FURNACES.—The Booth Electric Furnace Co., Chicago, has issued an 8-page bulletin describing its improved 2-phase, 2-electrode furnace. The bulletin is well illustrated giving a graphic presentation of construction and operation. The furnaces are built in five sizes, from 1500 pounds to 12 tons rated capacity, although each will melt approximately 25 per cent over the rate. The new furnace is oblong, with two electrodes through the roof and an auxiliary electrode inserted through the door in the front of the furnace. A simple mechanism for tilting facilitates the handling of slag through either door into the pit.

BY-PRODUCT PLANTS.—A 68-page booklet, entitled, "By-Product Coke and Gas Plants," has been published by the Koppers Co., Pittsburgh. A brief, but thorough, history of the development of the by-product coke oven is given and is followed by descriptions of the modern coke oven, regenerative gas ovens, combination coke and gas ovens, by-product recovery methods, ammonia concentrating plants, recovery and refining process, coal and coke handling systems, the utilization of coke oven gas, tar distilling plants and laboratory and research work. The booklet is profusely illustrated throughout with cuts of actual installations and is printed on heavy coated stock.

TITANIUM ALLOY.—The Titanium Alloy Mfg. Co., Niagara Falls, N. Y., has issued a 32-page booklet, describing the use and effect of titanium alloys in deoxidizing steel. It contains numerous analyses, tensile tests, and endurance tests as well as photomicrographs of treated and untreated steel. An interesting table shows effect on steel rolled into plates and sheets, particularly the latter when galvanized. The pamphlet is an effort to make clear the theoretical reasons for expecting titanium to be of value in steel. The same company has issued a pamphlet on pigments produced from titanium oxide and the result of tests from panels erected in various parts of the country to indicate its resisting power. A leaflet comes from the same source covering a new opaquing material made from zirconium products for use in the manufacture of white opaque glass and enamels.

ELECTRIC HOISTS.—A brief description of the salient points of a line of electric hoists manufactured by the Victor R. Browning Co., Cleveland, is given in an 8-page booklet, which the company recently published. According to the booklet, this line of hoists is built for use in structural shops, automobile factories, foundries, machine shops, loading platforms and other industrial works where continuous rough use is encountered. Some of the features of these hoists, as pointed out by the catalog are: The castiron hoist drum has all surfaces machined and contains deep grooves to receive cable; the removal of six cap screws gives access to the compact controller, which can be removed as a complete unit; heat treated gears and disc load brake occupy an individual compartment and operate in oil; the motor, which operates on ball bearings, is contained in a separate compartment and is protected by a steel plate. Other parts of the hoist are described and the numerous illustrations give the reader a comprehensive idea of the equipment.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

CO-OPERATIVE OFFICES

Cleveland, Chamber of Commerce; Cincinnati, Chamber of Commerce; Los Angeles, Chamber of Commerce; Philadelphia, Chamber of Commerce; Portland, Oreg. Chamber of Commerce; Dayton, Ohio, Chamber of Commerce; Pittsburgh, Chamber of Commerce

A firm in Belgium desires to purchase machines for cutting tobacco and for manufacturing cigarettes. Opportunity No. 30742.

Machines for working and blowing glass are desired by a firm in Italy. Opportunity No. 30743.

A firm in the Netherlands desires silver-working machines, including flattening mills, pressing machines, joiners' benches, drill machines, lathes and polishing machines. Opportunity No. 30746.

The representative of a firm in Italy now in the United States desires agencies for the sale in Italy of coal, machinery for making needles and pins, etc. Opportunity No. 30749.

A manufacturer in Paraguay desires machines for the manufacture of wax matches. Correspondence should be in Spanish. Opportunity No. 30751.

A merchant in Belgium desires an agency and consignments of hardware, such as carriage hardware and forge equipment. Opportunity No. 30752.

A municipality in the Dutch East Indies desires 2300 tons of cast iron pipe. Opportunity No. 30755.

An engineer in France desires representation of an American firm as an agent or technical and commercial assistant for the sale of machinery and tools of all kinds. Opportunity No. 30755.

An American exporting company desires to purchase suitable engines and boilers of a type necessary for running a rice-milling plant. Opportunity No. 30761.

A firm in India desires connections with exporters and manufacturers of cutlery, hardware, antimony ware, novelties, etc. Opportunity No. 30762.

The government of a South American republic desires to purchase linotype machines, presses and similar equipment. Correspondence should be in Spanish. Opportunity No. 30767.

A firm in Turkey desires to secure agencies and requests samples and catalogs covering portable houses and mechanical carpentry, baths, sinks, water-closets, building hardware, etc. Opportunity No. 30769.

An engineer in a municipality of South Africa desires to purchase a stamping machine. Opportunity No. 30770.

A firm in Czechoslovakia desires agencies for the sale of agricultural implements. Opportunity No. 30771.

Representation is desired by a firm in the Dominican Republic of exporters of iron and steel, chemicals, and other materials. Opportunity No. 30772.

A company in South Africa desires catalogs of machinery for use in the dried fruit business, such as grading, sorting, pressing and drying machinery. Opportunity No. 30778.

The representative of a firm in Argentina is in the United States and desires an agency for the sale of automobiles and accessories, novelties, specialties, etc. Opportunity No. 30819.

Catalogs and quotations on agricultural machinery and hand machinery for making underwear are desired by a man in Italy, in view of securing an agency for selling throughout that country. Opportunity No. 30823.

A commission agent in France desires an agency for the sale of leather, machine tools, etc. Opportunity No. 30825.

A company in England desires to represent on a commission basis manufacturers of any patent or specialty which can be marketed in conjunction with shipping and collieries. Opportunity No. 30831.

An army officer in Europe desires catalogs of logging machinery, logging railway, portable cranes, circular, band and multiple-blade saws, also complete estimates for an outfit capable of cutting, transporting and sawing into boards, 100,000 tons of timber per annum. Correspondence should be in Spanish. Opportunity No. 30832.

A firm in France desires to purchase and later secure an agency for all kinds of machinery for the manufacture of shoes. Opportunity No. 30835.

The purchase of shearing machines up to ¾-inch, punches, drills, pneumatic-riveting plant, and electric welding machinery, is desired by a party in Roumania. Opportunity No. 30836.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, October 16, 1919 *No. 16*

Strike Factor Passing Rapidly

Ceases to be Regarded as Major Consideration in Some Districts—Resumption of Mills and Furnaces is Speeded up—New Business Continues Active—Many Boat Contracts Placed—Pig Iron Market Higher

STRIKE interruptions virtually have ceased to be regarded as a major factor in iron and steel production in certain districts. Generally more progress has been made the past week in restoring former activities of the mills and furnaces than in any similar period since the walkout of the workmen. A good many plants have reached or are approaching the stage of operations in effect at the time of the strike. This does not represent capacity output, however, since a shortage of labor in various cases then was felt and developments of the past few weeks have not contributed to improve this underlying situation. With the steel strike well in hand producers are giving serious consideration to the effect of a possible suspension in the coal fields Nov. 1.

The improvement in the operating position of the industry has been marked by the first break in the strike in the much-affected Cleveland and Youngstown districts. All the blast furnaces at Cleveland still are idle, but two mills have resumed. In the Mahoning valley the first steel works blast furnaces to be started since the strike are under way, and some steelmaking and mill capacity is active. It is expected that from this starting point, operations gradually will be extended. Sheet production is being restored with greater rapidity. The largest maker began the week with 85 per cent of capacity active and some additional mills have resumed since. Its tinplate operations are around 60 per cent. Independent sheet and tin plate plants are up to about 75 per cent of the rate of output prevailing before the strike. The Carnegie Steel Co. has increased the number of blast furnaces in commission since the outbreak of the strike from 20 to 35.

Many Ships Are Let

Ship work is calling for some round tonnages of steel and the prospects of the plate market correspondingly have brightened. New contracts tentatively or actually closed with four or five eastern yards call for 25 to 30 vessels, representing a requirement of 75,000 to 100,000 tons of steel. Most of these boats are of the tanker type. A provisional order for eight vessels of this kind has been closed by one large steamship interest at New York. Pacific coast yards are inquiring for 16,000 tons of ship steel from mills in the Chicago district.

Iron Market Is Higher

With some of the merchant furnaces still banked and unable to ship, prompt pig iron is increasingly scarce, and the market has moved upward. The $26.75 furnace price for this year and first half which steel was quoted by important lake interests, disappeared this week. Whatever new business now is booked will be subject to an indeterminate advance to be announced by Jan. 1. In all sections some sales are being made on a higher basis. In their quest for tonnage, buyers are taking up off lots without hesitation. Some round sales of basic and malleable have been closed at Chicago.

Premiums are being freely paid for prompt or early material. Steel bars are reported to have sold as high as 2.80c, Pittsburgh. Semifinished material, the supply of which has become more pinched by the resumption of various finishing mills, is being held $2 higher by middlemen. Bar iron has been advanced $2 at Chicago. The demand for reinforcing bars is heavy and prices are strong.

Structural business appears to be going ahead more vigorously after some hesitancy on the part of prospective buyers. Reported awards of the week total about 15,000 tons. A 10,000-ton hotel at Detroit is up for bids.

Export Sales Maintained

Export sales are well maintained it is estimated around 400,000 tons per month. The longshoremen's strike at New York now has interposed a further check on deliveries and unshipped tonnage is backing up. Sheets and wire for overseas shipment are scarce and premiums of $3 to $5 per ton are being paid in these lines. Japan continues to buy freely. Inquiries from that source alone total 60,000 tons of basic and several thousand tons of foundry pig iron. New purchases amount to about 10,000 tons of iron. Orders for shipbuilding material placed by Japan this year are estimated around 400,000 tons. A British inquiry calls for 10,000 tons of low phosphorus iron. A 10,000 to 15,000-ton bridge over the Danube for Roumania is expected to come to this country, credits having been arranged.

Tariffs on a New Base

CONSIDERABLE opposition has developed to the tungsten ore tariff as proposed in Timberlake bill H R 4437 now pending before the senate finance committee. The bill, as it passed the house, calls for a duty of $10 a unit, equal to $700 a ton of 70 per cent ore and works out to about $1 a pound of metallic tungsten contained in ferrotungsten. The bill also carries an amendment imposing a retroactive tax on stocks of imported ore already in this country, which has aroused much condemnation.

Representatives of a number of companies interested in tungsten met in New York recently, including tool steel manufacturers, exporters of finished tools, ferrotungsten producers, refiners of tungsten ore and importers. A resolution was framed at the meeting and has been sent to each of the members of the senate finance committee, declaring "undivided and determined opposition" to the bill. The resolution laid stress on a statement credited to the United States geological survey that American supplies are sufficient to last for only three years. The western producers of tungsten ore had argued for the tariff on the ground that the domestic tungsten industry must be protected so that the nation would have supplies in the event of future war.

The whole tariff question has been affected by the events of the past five years and no doubt it may take five times five years for the brains of this generation to settle many of its new complexities. Relative labor costs have been thrown out of balance temporarily, but central and eastern Europe, with three times as many people to the square mile as in the United States eventually must work out lower labor costs, when protection may again be an imperative consideration. But for the time being, when our balance of trade has grown so overwhelming that it is a detriment rather than an asset, when imports of raw materials are to be encouraged that our exports of finished products may be maintained, and when economy of production to reduce living costs is universally urged, it would seem a step backward to endorse such a tariff now. Legislation should look to the greatest good for the greatest number. This being so, the senate finance committee should consider the tungsten tariff bill thoroughly and seriously before stamping it with its approval.

Bringing Out the Truth

WHILE it seems that the senate committee on education and labor will be able to do nothing in the way of recommending legislation for settlement of the steel strike, the visit of members of that committee to the Pittsburgh district should prove desirable to the industry. Its trip through mills ought to convince it, if it went with open minds, that working conditions as painted by labor agitators do not exist, but on the contrary are altogether satisfactory. It should prove to the committee that the workmen in the main are contented, live comfortably and desire to be left alone. It should prove that the acts of violence of which the committee has heard so much in reality are being perpetrated by the strikers urged on by agitators who would not hesitate for a moment to destroy not only the steel industry but the government itself if they had the power. And, what is more, the visit should convince the members of the committee that there can be no doubt as to the outcome of the strike, and that Americanism and justice will prevail and labor unionism as represented in the present issue will be utterly routed.

Indeed it has been almost routed now and in effect the strike has been won by the manufacturers. It is because this is so well known to him that President Samuel Gompers of the American Federation of Labor has tried the last resort of asking the industrial conference in Washington to "arbitrate" the strike. He is hoping against hope that something may be brought about which will

save the unions from a direct and disastrous defeat and preserve some standing before the country for the shaken American Federation of Labor. Yet Gompers knows as well as any clear-thinking man that the principle involved cannot be "arbitrated" and Judge Gary has made that fact distinctly plain.

The senate committee members must have learned many things, if it made its visit for the purpose of obtaining first hand information.

Winning the Real Export Prize

THE recovery of exports in iron and steel for August, according to the figures just announced, following the sharp slump in July, suggests strongly that special conditions operated to bring about the decrease in the latter month. In June the country shipped to foreign destinations 561,020 gross tons which by a considerable margin was the largest month of the year. In July this total dropped precipitately to 287,685 tons. Eliminating both June and July from calculations, it is shown that the average outborne deliveries for the seven months beginning in December, 1918, or the month following the armistice, were 379,231 tons. The combined average of the low and high months of the year, or June and July, was 424,337 tons. It is evident therefore that the August figures of 396,743 tons approximately are on a par with what may be regarded as the normal monthly export movement since the ending of the war.

The falling off of exports in July variously had been attributed primarily to the foreign exchange situation and to the dock strike in New York during that period. It would seem to be indicated by the August total that foreign exchange was the lesser of the two factors as a retarding influence. While the premium on the American dollar caused by the preponderating flow of trade to this side, operates strongly to discourage purchases from American mills and furnaces, because in effect it raises the price, it is well to remember that this situation is applicable chiefly to Europe and not so uniformly to other countries of the globe to which this country may sell iron and steel. In fact in some of these countries the American dollar is near parity. After all it is the demand for iron and steel from the world apart from Europe that is the important thing for the American manufacturer. Before the war Europe on the whole produced sufficient iron and steel within itself to supply its own needs, and in time, it promises to restore itself to this position. The rich prize in the iron and steel export trade of the world is that which lies in the insufficient-producing or nonproducing countries and at the present time the United States appears to have a commanding lead in this commerce.

Now is Time to Save Coal

CONSIDERING the high cost of coal in England it is not surprising that the subject of fuel economy held the close attention of prominent British ironmasters for two days at the recent autumn meeting of the Iron and Steel institute. As outlined elsewhere in this issue, discussion centered about a report on "Fuel Economy and consumption in the Manufacture of Iron and Steel," presented on behalf of the British association fuel economy committee. This report includes the results of investigations covering 21 companies operating blast furnaces and contains interesting revelations.

Of the blast furnaces examined, only those of three firms were equipped with double bells, while two companies operated stacks with open tops. Furnace gas was used in internal combustion engines for generating the blast in only five of the plants investigated. Half of the operators lacked sufficient data to enable them to estimate even approximately the heat losses at the stoves and boilers, and four admitted that they had no data whatever as to the temperature and composition of the chimney gases. One producer made an attempt to utilize the heat in molten slag, and three companies which had adopted or experimented with hot blast claimed that the resulting economy was not sufficient to justify its use. Referring to the problem of fuel economy in isolated furnace plants, the report reads, "It is indeed depressing to have to record the confession of one firm that it has 40 per cent of gas above its requirements which is allowed to go to waste; but we fear that a similar admission would have to be made by many other undertakings if a strict inquiry were instituted into their fuel consumptions."

In view of the difficulty Great Britain is encountering in maintaining coal production, the conditions revealed in the report are particularly significant. While it is true that under certain conditions the value of strict fuel economy is discounted by other factors, such as prohibitive cost of new equipment, etc., there seems to be sufficient evidence in the report to warrant the statement that in the plants investigated too little attention is being paid to the consumption of fuel. There can be no excuse for failure to know temperatures and composition of gases, and the practice of allowing surplus gas to go to waste is particularly intolerable at this time when fuel of all kinds is so much in demand. The means of effecting vast economies are known but not employed. The problem is one of scientific organization, co-ordination and application rather than of the discovery of new principles, and merits the serious consideration of the United States as well as England.

Iron and Steel Prices

Prompt Iron Scarce, Prices Rise

Eastern Furnaces Virtually Booked Full for This Year—Off-Lots More in Demand—$26.75 Price Disappears in Middle West and Producers Plan Indeterminate Advance for Next Year—Round Lot Sales Made at Chicago

Philadelphia, Oct. 14.—The supply of pig iron in the East now practically is sold up for the rest of the year. Most furnaces have no more to sell while the others have only a little. It is expected there may develop shortly a situation like that during the war where the only spot iron obtainable, was off grades and small tonnages. While consumers are pretty well covered and there are few big inquiries, there is a constant call for prompt tonnages. Most of the recent demand upon eastern furnaces has come from New England consumers and is due to the inability of idle Buffalo furnaces to make deliveries on their contracts. Prices reflect a strong situation No. 2X (2.25 to 2.75 silicon) now ranges from $31 to $32 eastern Pennsylvania furnaces while No. 2 plain (1.75 to 2.25 silicon) is $1 lower and No. 1X (2.75 to 3.25 silicon) is $1 higher. The minimum for western Pennsylvania stacks which still have some iron for this year is $29, $30 and $31 furnace respectively for the three grades. The price on Virginia No. 2X is $30 furnace. There is no Virginia No. 2 plain obtainable and one furnace has withdrawn on silicons higher than 2.75. Another Virginia furnace is selling high silicons at the regular government differentials, $31.75 for No. 1X, etc. Only one eastern Pennsylvania furnace is a seller for next year. This interest continues to book first quarter orders at $32 furnace for No. 2X and $33 for No. 1X. Premiums above the regular market continue to be secured. One maker sold round lots of No. 2 plain at $31 and $32 eastern Pennsylvania furnace. Two round lots of malleable have been sold at $31 eastern Pennsylvania furnace. Two sales of basic to eastern consumers have been closed, one involving several thousand tons and the other 1000 tons at the market price of $28 delivered. Sales of low phosphorus include 1000 tons of standard iron at $37 furnace and another of 1000 tons of copper-bearing at $35 furnace. Several small lots of copper-bearing including one for Pacific coast also have been placed. The Standish, N. Y., furnace went into blast today. The trade reports an active inquiry from eastern consumers for gray forge for first quarter. All furnaces now worried over threatened coal strike of Nov. 1 and banking or blowing out of numerous stacks would not cause surprise.

Good Demand in Boston

Boston, Oct. 11.—Spot pig iron has tightened in the local market, until at present it is doubtful if a sizable order would be taken by any of the regular furnaces. The Susquehana furnace at Buffalo, is entirely out of the market and deliveries from its yard are moving slowly. Other Buffalo furnaces are nearly all sold up as far as this year's delivery is concerned, although one or two still offer iron for first quarter. Several of the eastern Pennsylvania furnaces have withdrawn from this year's market, and one furnace reports having to refuse business from an old customer which was offered at any price, delivery before Jan. 1. Virginia furnaces are offering some iron and making some sales but their attitude is extremely independent and many inquiries have been turned down. One furnace in the Virginia territory has sold 2X iron (2.25 to 2.75 silicon) at $30, furnace, and quotes this as its minimum price even for lower silicon iron. Prices for 1920 iron have advanced about $1 in nearly all of the furnaces where this delivery is offered. Small sales of 2X iron (2.25 to 2.75 silicon), have been reported for first quarter delivery at $33, furnace. Bethlehem is offering 1920 iron, as well as some lots for spot and last quarter delivery. A Buffalo furnace is known to have shaded the 1920 price, and one of its customers reports a quotation of $28, furnace, for first quarter delivery of 2X eastern iron (2.25 to 2.75 silicon). Sales in this territory during the past week have totaled about the same as the week previous. A Rhode Island consumer bought 1000 tons of malleable iron from an eastern Pennsylvania furnace for next year delivery at the same price as the spot market for 2X iron. A Framingham, Mass., consumer has been in the market for 4000 tons and placed an order for half of this during the week.

Foreign Demand Grows

New York, Oct. 11.—Pig iron demand from abroad is reaching large proportions. Japan alone has inquiries out for approximately 60,000 tons of basic, and, in addition, wants several thousand tons of foundry iron. One Japanese buyer during the week placed an order for 5000 tons of basic, which, with a previous order, makes a total of about 10,000 tons of this grade closed by Japanese interests during the past 10 days. It is understood most of this tonnage was booked by an eastern steelmaking interest. Japanese buyers during the week closed for considerable foundry iron in the South, at $28, Birmingham, for 1.75 to 2.25 silicon, while in some instances $28.50, Birmingham, was paid. In addition to the Japanese inquiry, heavy tonnages are wanted for other countries. An Eng-

lish interest wants 10,000 tons of low-phosphorus, and a Belgian consumer, 5000 tons of this grade. A Scandinavian buyer asks 1000 to 2000 tons of foundry, South America 800 tons of foundry, and numerous other feelers have been put out.

Domestic demand also increased very noticeably during the past week. Heavy sales are reported in Connecticut and other New England states, and new inquiries from that section are heavy. There is an improved inquiry from New York state and New Jersey melters. Altogether, current domestic inquiries call for more than 20,000 tons, principally foundry iron. Included are one lot of 5000 tons, one of 3000 tons; two of 1500 tons, each, and many smaller tonnages, mostly for shipment next year. The desire to buy is based largely on the fear of consumers that if they do not take prompt action, they will be unable to get sufficient iron to get a lower price. Prices on foundry iron rapidly are hardening. Eastern Pennsylvania No. 2X foundry (2.25 to 2.75 silicon) is being sold at $32, furnace, and the minimum is not far from $30.50, furnace. Buffalo iron is bringing fancy prices. While the bulk of this tonnage has been sold in this district at $29.50 to $30, Buffalo, for 2.25 to 2.75 silicon, moderate lots of this grade, even slightly off quality, have brought as high as $33, Buffalo. It is believed $32, eastern Pennsylvania furnace, now is minimum on 2.25 to 2.75 silicon for next year, and the asking price in a number of cases is $33. A consumer in this district recently placed 1000 tons of basic at a price which it is said now could not be duplicated. A small tonnage of eastern Pennsylvania malleable has been sold at $31, furnace. Some eastern Pennsylvania bessemer iron has been offered at $31, furnace.

Sales Are Considerably Smaller

Pittsburgh, Oct. 14.—Transactions for pig iron have dwindled to extremely small proportions the past few days due to the fact that the Steel corporation subsidiaries have blown in a number of stacks which were banked following the outbreak of the strike and no longer are in the market to make up the defficiency in their own production. Estimates of the purchases of the Steel corporation run anywhere from 45,000 to 60,000 tons, largely basic, but including a fair amount of bessemer. At least 30,000 to 40,000 tons of basic were purchased for the Pencoyd works of the American Bridge Co. while the remainder was scattered among the works of the American Steel & Wire Co. and some went to one of the valley plants of the Carnegie Steel Co. These purchases have pretty well cleaned up stocks of the steel making grades that were on the yards of the merchant blast furnaces and some of the independent steel companies. Business during the past two or three days has been largely in small lots but fairly well scattered among the different grades. Malleable has been moved at $27.25 furnace while sales of bessemer in lots running from a carload up to 500 tons are noted at the full market price of $27.95 furnace. A good many small lot inquiries are coming out for foundry iron and most producers are willing to take on these orders at the regular market base of $26.75 furnace for No. 2 grade (1.75 to 2.25 silicon. Some sellers, however, are quoting as high as $29 furnace for No. 2 foundry but no business yet has been reported at that figure. The Carnegie Steel Co. now has 35 blast furnaces in operation as compared with about 20 the first few days of the strike, while the Pittsburgh Steel Co. has one of its two stacks at Monessen, Pa., in blast and in the Mahoning valley, the Brier Hill Steel Co., Youngstown Sheet & Tube Co., Republic Iron & Steel Co., all have furnaces again in operation. The stack of the Clinton Iron & Steel Co., Pittsburgh, was blown in last Saturday night on foundry iron.

Selling in Buffalo District

Buffalo, Oct. 14.—Uncertainty of the labor situation has not served to stop all selling of iron in this district. Although most of the interests are out of the market, one is booking fair tonnages of iron for 1920. During the past week this interest sold three grades, aggregating a few thousand tons. Some No. 2X (2.25 to 2.75 silicon) has been sold at $29.50. No. 2 foundry (1.75 to 2.25 silicon) has been sold for $28.50, and 2.75 to 3.25 silicon iron has been sold for $31. There is no anxiety to take orders. Plenty of inquiry is in sight, and it is generally believed that with the settlement of the strike the price of iron will increase. Other interests affected by the strike are not contracting, and will not sell until their furnaces are operated.

$26.75 Price Disappears

Cleveland, Oct. 14.—With shipments shut off from all the local furnaces the iron market in this district continues to show increasing strength, especially for spot or nearby delivery. Numerous consumers are coming into the market for spot iron and they are freely willing to pay premiums, which in most cases are being asked by the comparatively few furnaces able to ship into this territory. Some melters are complaining that their supplies are running dangerously short and that their operations are likely to be affected by the shortage unless they are helped out by shipments from some of the furnaces with which they have contracts. Additional sale scales of southern Ohio iron at $29.75 furnace for $32.15 Cleveland for 1.75 to 2.25 silicon have been made in the past week. An offer of $30 furnace for 2.25 to 2.75 silicon is reported by one maker. A sale of 1000 tons of malleable at $28 Buffalo was closed. Makers continue to find a ready market for off lots, one of them selling 2000 to 3000 tons additional in the week at differentials from the $26.75 base price. This same interest disposed of 4000 to 5000 tons of standard grades at the $26.75 base price. This latter figure, however, now has disappeared from the market, either for this year or for shipment after Jan. 1. Some producers still will protect regular customers through the first half, but the prices on these tonnages are left open and are subject to such determination as shall be made by Jan. 1. This is due to the uncertainty over future costs. Shipments of steel-making iron in various directions still are suspended because of the interference of the strike on steel works operations. Where some of the mills have resumed, these shipments have not yet been ordered forward, since these plants have a considerable stock on hand which was accumulated from material in transit at the outbreak of the strike. New inquiry for iron is fair, but that for forward delivery does not seem so liberal. Where the furnaces are able to ship, their stocks continues to be reduced.

Chicago Inquiry is Heavy

Chicago, Oct. 14.—Melters of pig iron in the Chicago district are looking to their forward requirements and some heavy inquiry is being entertained for first half delivery. Demand for prompt iron is less in tonnage but more insistent since it is dictated by actual needs. A local seller disposed of 500 tons of southern iron which was in transit and ready for immediate delivery. Production in the immediate Chicago district promises to be increased as striking furnace forces are returning gradually to work. One furnace which had been banked for three weeks was put in blast a few days ago. As more men return other idle furnaces will resume. The tendency of producers seems to be to retire from the market for the next few weeks until the situation as to cost of fuel and labor have been decided and until future freight rates are more certain. It seems likely that when selling for 1920 delivery is started actively quotations will be higher than have prevailed recently, although leading makers would prefer not to increase their prices. Two large sales have been made recently for first half, a malleable foundry taking 10,000 tons of that grade and an Indiana consumer closing for an equal tonnage of malleable and foundry. An inquiry is current for 10,000 tons for first half for the Indiana plant of a Chicago manufacturing interest. An inquiry for 500 tons of 2.75 to 3.25 silicon for first quarter from a northern Illinois manufacturer is out. Iron from outside sources is being delivered in the Chicago district, at $3 to $4 over the nominal Chicago figure, indicating the anxiety for prompt delivery. Some of this iron is coming from the South and considerable tonnage from the Soo. Lake Superior charcoal producers formally have not opened their books for 1920 delivery, but have made quotations on definite inquiries for next year at about $1 above the 1918 schedule. An important southern producer who has been selling at $28, furnace, for 1.75 to 2.25 silicon is willing to take some business for first quarter at $29 for the same grade.

Want 8000 Tons of Malleable

Cincinnati, Oct. 13.—A general inquiry for approximately 8000 tons of malleable bessemer has been issued by the Link Belt Co., for shipment to its Indianapolis plant during the last quarter of 1919 and first half of 1920. There is a better inquiry for foundry iron for first quarter and first half shipment, but the reluctance of furnaces to take on any more business for that delivery is more marked. If any contracting is being

done it involves only small tonnages for favored customers. Some southern foundry iron (1.75 to 2.25 silicon) is being sold for last quarter shipment at $28, Birmingham, with $1.10 advance asked for 2.25 to 2.75 silicon. Northern foundry iron seems to be cleaned up for prompt shipment, and Ironton producers are holding at $29.75, furnace, for 1.75 to 2.25 silicon. The feeling is general that furnaces will soon fix a figure for next year, and when this is done heavy buying is likely to start. The foundries state that they are handicapped in bidding on future contracts without a supply of iron in sight. However, the furnace operators are equally handicapped because they are not yet able to make a conservative estimate of what their producing costs will be after Dec. 31.

Buying at St. Louis Not Large

St. Louis, Oct. 11.—Buying of pig iron to take the place of tonnages from Chicago and the East, delayed by the strike, has not been up to expectations of dealers in this district. Consumers do not want to buy at present prices and most of them are supplied. Some activity continues in southern iron, mainly in small lots for immediate shipment to fill in with. One dealer reports sales amounting to 1000 tons, and total sales during the past week are estimated at from 2500 to 3500 tons. One important Eastside interest, it is believed, will be in the market for 6000 to 8000 tons of basic before the end of the month. Consumption is on a large scale, all foundries working at full capacity. The Mississippi Valley Iron Co.'s furnaces are still out of blast. Repairs and enlargements will not be completed before Jan. 1.

Good Market in South

Birmingham, Ala., Oct. 14.—Southern furnace companies are able to sell pig iron without the least difficulty. Regular customers are being accommodated and no effort is being made to obtain business, confidence being manifested that all the iron offered will find an easy market. The sale of 1000 tons of 1.75 to 2.25 silicon foundry iron to Japanese interests, to be shipped during the last quarter, may be followed by other export business. Opinion among manufacturers now is that the base price of iron, $28 for No. 2 foundry, (2.25 to 2.75 silicon) is too low, and in some quarters the belief prevails that when 1920 buying starts $30 will be considered as a minimum. Production is to be increased, as railroad cars are not so scarce as recently. Two producers are practically out of the market for a while, and others are selling cautiously. Inquiries for 1920 iron are numerous. Production is now estimated to be at least 200,000 tons a month in Alabama. It is impossible to accumulate coal, coke, ore and limestone at the furnaces, but officials are not expressing any apprehension as to a coal strike Nov. 1.

Approximately 138,000 tons of various grades of pig iron are piled in furnace yards in this district. The stock of foundry grades particularly is low. In this district 26 stacks are in operation.

Coke Market is Stronger

Spot Beehive, Furnace Grade, Advances 25c in Week, Due to Curtailment of Production—Foundry Coke Quoted at $5.50 to $6

Pittsburgh, Oct. 14.—Spot beehive oven coke of furnace grade is fully 25 cents a ton higher than it was a week ago; not that the demand has increased materially so much as because of a sharp curtailment of production probably brought about by withdrawing the fires from some ovens and by drawing the ovens at considerably longer intervals than usual. Occasionally some unconsigned cars become available and in the past few days sales of such tonnages have been made as low as $3.85, ovens. As a general proposition, however, the market is not quotable below $4 on oven shipments, and some bases exist for quotations as high as $4.15 and $4.25, ovens. The Connellsville region seems to be well cleaned up on free coke and with the blowing in of several steel plant blast furnaces, the market gives signs of having seen its lowest level for the present. Meanwhile, no actual business is being negotiated in 48-hour fuel for the first half of next year, although consumers are putting out feelers as to prices and prospects. The market on standard foundry coke still is quoted at $5.50 to $6, ovens, with supplies fairly generous, due to the recent practice of oven operators in drawing coke at 72 or 96-hour intervals. This condition means that more foundry coke is available than is needed to meet contract obligations and spot sales consequently are rather harder to negotiate at better than $5.75, ovens. The Connellsville production of coke for the week ended Oct. 4 is estimated by *The Connellsville Courier* to have been 157,600 tons as compared with 186,120 tons in the previous week.

Look for Advance at Boston

Boston, Oct. 11.—With the Providence by-product producer sold up for this year, and with the Connellsville concerns apparently uninterested in New England, a rise in spot coke prices seems probable. The first half flat rate price of $11.90 is holding firm, and new business is continually being placed at this figure.

Sells for Next Year

New York, Oct. 11.—The northern New Jersey by-product coke producer has opened its books for first half on foundry coke contract at $6.50, Connellsville, which is equivalent to $9.50, delivered at Newark and other northern New Jersey points. This seller, however, continues to ask $6, Connellsville, for this year, equivalent to $9.10, delivered. Western Pennsylvania foundry coke reflects some weakness and may be had for spot shipment from $5.50 to $6, Connellsville. This is a decline of about 25 cents.

Sell for First Half Shipment

Cincinnati, Oct. 13.—A few contracts for both Connellsville and Wise County foundry coke are being closed for first half shipment. The former is sold for that delivery around $6.50 to $7, and the latter at $7.50 to $8. A little spot business is being done at the minimum figures named. Furnace coke production has been reduced appreciably in the Connellsville field, and $4 may now be considered minimum, although some interests are asking $4.50, ovens. New River foundry coke is hard to get, although an occasional car is obtained at $9 to $10.

Prices Shaded at St. Louis

St. Louis, Oct. 11.—Temporary shading in coke prices was reported during the week, applying mainly to tonnages released in the Connellsville district by closing down of plants affected by the strike. One dealer reported having been offered 25 cars of 72-hour foundry coke on track in Ohio, which he was able to sell to St. Louis melters at a price slightly under current quotations.

Ore Going Forward

To Furnaces as Strike Conditions Continue to Improve

Cleveland, Oct. 14.—More ore is going forward to furnaces than at any period since the strike of foreign-born laborers in the iron and steel industry. Improvement in the strike situation is reflected in the gradual lifting of embargoes declared by the railroads to prevent blockades of loaded cars at furnaces. While some furnaces have resumed operations and are again consuming ore, owners of others not yet in operation are succeeding in obtaining labor with which to unload cars and are stockpiling the ore.

Some measure of relief has thus been afforded ore companies which are seeking to make deliveries before the close of the season, but storage facilities at lower lake ports are overtaxed and many boats are idle and awaiting to be unloaded. Should present conditions continue several weeks more, ore companies say they will be unable to bring down all the ore contracted for.

Negotiations are in progress for some additional sales, but prospective buyers are told there is slight chance for obtaining the ore, unless the steel strike should be declared off within a few days.

In September furnaces took 3,698,602 tons off Lake Erie docks while in the same month in 1918 they took 4,863,253 tons. The balance of ore on docks at Lake Erie ports Oct. 1 was 8,203,427 tons, compared with 8,931,454 on Oct. 1, 1918.

All docks with but two exceptions are working, and no further steps have been taken by the lake seamen toward a strike.

Some Scrap Grades Rise

Rolling Mill Material in Demand—Western Turnings Sold in East—Embargoes Hold Back Market on Heavy Melting Steel

FOR COMPLETE SCRAP PRICES SEE PAGE 1085

Chicago, Oct. 14.—As a result of increased demand for bar iron to replace steel bars made scarce by the steel strike, demand for rolling mill grades of iron and steel scrap has increased, and quotations have been advanced from 50 cents to $2 above former levels. The same condition obtains in the various grades of cast scrap, which are also in heavy demand and light supply. Conditions in the steel strike continue to hold down production of steel and mills have not yet removed embargoes preventing scrap being shipped in. The situation is becoming difficult for dealers as they have considerable material bought to apply on contracts which they are unable to ship. Railroad offerings are moderate for the most part. The Southern offers 2300 tons, the Santa Fe 1360 tons, the Northern Pacific 1000 tons, the Chicago, Milwaukee & St. Paul 500 tons and the Burlington 400 tons.

Boston Market Active

Boston, Oct. 11.—A partial recovery has been made from the low ebb of last week in the scrap market. Heavy melting steel is active; the price has advanced and is still advancing. Pennsylvania steel furnaces have been heavy buyers of scrap in many sections of the East during the past week. Philadelphia scrap brokers who have made large sales have been hurriedly placing orders here to protect themselves against a rise in price. The Worcester, Mass., subsidiary of the Steel corporation has been steadily buying heavy melting scrap, and other steel plants have made purchases here. Rerolling steel rails, stove plate, No. 1 machinery and borings have been particularly active. Lawrence, Amesbury, Everett, Readville, Fitchburg, and Taunton, Mass., have all been represented in the week's sales of No. 1 machinery, and the price in most cases has been $28, delivered. Pipe scrap has dropped, and is now being offered at $14 to dealers in Boston. Chemical works have been buying borings and dealers have paid as high as $14.50 for select lots. The Boston Elevated is asking for bids covering a lot of miscellaneous scrap, including cast motor frames, armature cores, steel shafts, and coil shells.

Transactions Are Limited

New York, Oct. 13.—While some large tonnages have been reported as having been placed by eastern consumers, the local scrap market has continued quiet. Sellers assert that heavy melting steel has been moving somewhat more freely but that the situation generally is inactive. Consequently, prices are undergoing little change. Clean cast borings have been marked up $1 and quotations generally are stronger, but only in the one instance has there been an advance.

Western Scrap is Sold

Philadelphia, Oct. 14.—Deprived of their usual outlet by reason of the strike, western scrap dealers are offering machine shop turnings at low prices in the east, particularly for shipment from the west. One eastern mill bought 10,000 to 15,000 tons at $14.75 delivered which is 75 cents under the regular eastern market. These western offers only are temporary and are expected to cease as soon as the mills are operating. The eastern scrap market generally is strong. While no more heavy melting steel has been sold, the steel mills generally want to buy but are offering to pay $19 and $19.50 while the dealers are holding for $21. An eastern furnace bought several thousand tons of blast furnace turnings at $14.50 delivered. Cast scrap and wrought scrap are in good demand and are strong. The only weak spot is wrought pipe for which there is no call.

Bids will be taken by the Philadelphia ordnance office up to Oct. 20 on 2189 net tons of 75-millimeter shell forgings at the plant of the Worthington Pump & Machinery Corp., Hazelton, Pa., and on 415 gross tons of bar steel at the plant of Bonney Vise & Tool Works, Allentown, Pa., and up to 2:30 p. m., Oct. 27, on 2404 net tons of 155-millimeter shell forgings at the plant of the Bethlehem Steel Co., Steelton, Pa.

Market is Quiet But Firm

Pittsburgh, Oct. 14.—No appreciable increase is noted in the demand here for scrap iron and steel while the shipments of material against contracts are more or less curtailed by railroad embargoes, but the market nevertheless has a firm tone and sentiment is fairly cheerful. Owing to the fact that steel companies have been operating open-hearth furnaces more fully than blast furnaces it is believed that reserve stocks of scrap held by these interests have been heavily depleted and their belief that the strike shortly will be a thing of the past also encourages dealers to look for better markets before long. Reports reaching this market from the East tell of a strong demand for heavy melting steel at $20, delivered Philadelphia. This is equivalent to about $21.50, delivered here, on eastern scrap of this grade as there is a freight differential on eastern shipments of about $1.50 a ton in favor of Philadelphia over Pittsburgh. Small lots of heavy melting steel have been bought by steel companies here at $20, delivered, but it is frankly admitted that no big tonnages can be obtained at that figure. Sales of unguaranteed low phosphorus scrap are noted at around $20 to $20.50 and other grades of steel scrap which usually command a slight premium over heavy melting grades, now are quoted at abou the same price. Almost no demand exists for sheet steel scrap and it is quoted at a greater discount than usual under heavy melting grades.

Good Demand for Borings

Buffalo, Oct. 14.—Some grades of scrap are active, despite the strike. There is a good demand for cast and stove plate and demand for borings is exceptionally good. No changes in prices are recorded, though some of them are nominal. There have been few sales, and so far as can be learned, no large ones.

Much Tonnage On Track

Cleveland, Oct. 14.—A large amount of scrap iron and steel is on track in this district, and dealers believe it will take melters a week or 10 days to clear this away once full operations are resumed. Some melters are working again, but dealers do not look for anything like active trading for two to three weeks.

Large Stocks Held at Cincinnati

Cincinnati, Oct. 13.—Yard stocks of scrap are larger than recent estimates indicated. This applies especially to scrap for open-hearth melters. Shipments to outside districts are still delayed, although an improvement in the car situation is looked for soon. The closing down of the Whitaker-Glessner plant at Portsmouth, O., has shut off another melter of scrap in this territory. All steel scrap continues weak and erratic, and only nominal quotations can be given.

Bids will be taken by the Cincinnati ordnance office up to 2 p. m., Oct. 23, on 638½ gross tons of 2⅜-inch cold drawn steel rounds at the United States storage depot at Cincinnati, and up to 2 p. m., Oct. 24, on about 460 net tons of 2⅞-inch screw stock at the plant of the Maxwell Motors Co., New Castle, Ind.

Prices at St. Louis Marked Up

St. Louis, Oct. 13.—The market for scrap iron and steel is steady and higher, with the strength mainly in rolling mill grades. Mills in this district are doing considerable business as a result of the steel strike and dealers are disposed to advance quotations on the grades most in demand. Foundries also are very busy, especially the cast iron foundries. Consumption is on a large scale, and several of the most important consumers who have been drawing heavily on reserves will be obliged to enter the market soon. Rerolling rails are relatively quiet, the leading consumer of that material being virtually out of the market. Cast grades are strong, and about 50 cents higher.

Buying Government Scrap

Birmingham, Ala., Oct. 14.—Southern dealers in scrap iron and steel are keeping up their stocks, although trade is only fair. Consumers are said to be getting government scrap, but it is expected there will be a demand for a large quantity of industrial and agricultural scrap by 1920.

More Mills

Now are Operating on Sheets—Leading Interest at 85 Per Cent

Pittsburgh, Oct. 14.—The effect of the strike upon the operation of sheet mills steadily is waning. The American Sheet & Tin Plate Co. now has about 85 per cent of its sheet mills running, a gain in a week of about 5 per cent, while the independent mills now active represent close to 60 per cent of the total and to a considerably higher average if figured from the number which were in operation the last day before the strike was called. The week's gain among the independents has been fully 10 per cent, largely accounted for by the resumption by the Canton Sheet Steel Co., Canton, O., and some of the valley makers. The Apollo Steel Co., Apollo, Pa., which went down on the first day of the strike and resumed operations about a week later is reported to be getting back to normal operations, while the Allegheny Steel Co., Brackenridge, Pa., is running practically normal and the West Penn Steel Co., also at Brackenridge, Pa., is maintaining a fair rate of operation. Marketwise, conditions do not change much. Demands still are heavy, but makers are disinclined to consider other than specifications against old orders and even these are being scaled by most producers. Companies making their own sheet bars are building up stocks before trying to get all their mills going.

Big Orders Go Begging

New York, Oct. 11.—Owing to the fact that a number of sheet mills are idle because of the strike and that the plants now operating are booked to capacity for this year, numerous orders are going begging. One consumer is seeking to place 5000 tons and there are a number of inquiries involving between 1000 and 5000 tons each which cannot be placed. As a result of this situation, the recent shading has disappeared and sheet prices are being maintained.

Eastern Market Strong

Philadelphia, Oct. 14.—The mills of the leading eastern producer of galvanized sheets are shut down temporarily by a local strike. The market here is strong and orders are going begging.

Stocks Are Well Sold

Youngstown, O., Oct. 14.—With the exception of the Trumbull Steel Co. and the Sharon Steel Hoop Co., all sheet mills in the Mahoning valley remain inactive. Everything points to an early resumption of other sheet mills this week. Mill stock is not what could be called large. Considerable tonnage remains on the floors, however, principally because the railroad crews have refused to move loaded cars out of or empty cars into mill yards. Dealers have combed this district for the last three weeks until now little stock in the mills remains unsold. Attractive premiums have been paid for stock carded for immediate consignment. Available tonnages of medium and light-gage sheets, however, were bought up rapidly at the beginning of the shutdown and dealers state that mills in nearby territories have little material in these gages to offer. Sheet bars are extremely scarce.

New Business

In Wire Products Being Passed—Full Output in South

Pittsburgh, Oct. 14.—Although the past week has seen a resumption in operations by some of the makers of wire and wire products and increased production by those who recently started up after the suspension caused by the strike, none of the manufacturers yet has been able to make much headway in catching up with contract obligations and new business is getting no consideration. Even those who were unaffected by the strike have little surplus tonnage for immediate shipment. Production of rods is heavier than recently, but still far short of normal.

Production Normal in South

Birmingham, Ala., Oct. 14.—The plant of the American Steel & Wire Co. at Fairfield is producing wire and nails on a normal basis, and the entire output is in demand. Sufficient orders are in hand to keep the plant in operation for a long time. The wire departments of the Gulf States Steel Co., at Alabama City, are operating at capacity.

Detroit Buys

Round Tonnage of Cast Iron Pipe—Mill Orders Go Begging

Chicago, Oct. 14.—Detroit has placed orders for 7000 tons of cast iron pipe of which 2000 tons of 42-inch and 3000 tons of smaller sizes, went to the United Cast Iron Pipe & Foundry Co., and the remainder was divided between the American Cast Iron Pipe Co. and the Lynchburg Foundry Co.

Labor Reduces Shop Output

New York, Oct. 13.—Deliveries of cast iron pipe in the East are being further advanced, with the result that some shops are sold up to December.. In virtually all instances, the shops are unable to consider shipment before November. This situation is attributed principally to the shortage of labor, which has limited operations in most cases to around 65 per cent.

Mill Operations Gaining

Pittsburgh, Oct. 14.—Pipe mill operations are gaining in this district due to a steady return to work of men who have been out as a result of the strike. Both the A. M. Byers Co. and Spang, Chalfont & Co., now have some finishing capacity in operation. While the Pennsylvania works of the National Tube Co. which was down for a few days following the outbreak of the strike, now is operating at better than 50 per cent of capacity.

The Nonferrous Metals

	‡Copper	Future Straits N. Y.*	†Lead, New York basis	Zinc St. Louis basis	Aluminum	Spot antimony	Nickel ingot

Oct. 14	23.50	54.50	6.30	7.55	33.00	8.50	41.00

* October shipment from Singapore.
† American Smelting & Refining Co.'s price.
‡ Producers' price. Outside market, Oct. 8, 21.50c, Oct. 9, 22.25c, Oct. 10, 22.25c, Oct. 14, 22.375c; lake, 22.75c, casting 21.50c.

NEW YORK, Oct. 14.—Prices of nonferrous metals generally advanced sharply the past week, due largely to active buying by dealers and to a lesser extent by consumers, based on the favorable news from the steel strike districts. The London market was also strong and active and the higher prices for zinc in that market enabled a resumption of exports. The metal trade expressed belief that a large pent-up demand has accumulated in recent dull weeks and that when the steel trouble is concluded a renewed buying movement will come.

The large copper producers continued to stand pat at the 23.50c price for electrolytic but did little domestic business, scattering orders for export being placed through the Copper Export association. Dealers, however, advanced their quotations about 1c a pound, increasing them from the low of 21.25c to 22.25c. The amount of second hand copper still available at last seems to have become scarce and consumers have been picking up bargains here and there. Casting copper advanced from a low of 20.00c to 21.50c; lake copper was held at high as 22.75c. The steel strike has not perceptibly affected the brass industry as yet.

The zinc market advanced on heavy buying by dealers who brought the price up from 7.00c to 7.60c, East St. Louis, during the past two weeks. Increased interest by consumers also was evident, several consumers in the strike district inquiring for metal for shipment the remainder of the year. A good export demand for zinc developed during the week.

The lead market gained strength, sales being made at prices above the level of 6.25c, New York, the quotation of the leading interest. The highest price reached was 6.30c.

The strike of longshoremen in New York, together with the delay in arrival of 1500 tons of tin aboard the Gaelic Prince which suffered in a collision in the harbor last week, held back tin. The result was that prices of tin in New York warehouse were about one cent higher than that quoted for thousands of tons on board ship in the harbor. Spot Straits tin became quite scarce and was held at 56.00c to 56.50c, while tin ex-steamer was quoted at 54.50c. The London and Singapore markets advanced sharply. Futures are 54.50c, f.o.b. New York. Spot 99 per cent tin was obtainable at 54.25c.

Bar Production Growing

Consumers Getting Along With Available Material—Sales Reported at 2.80c—Chicago Bar Iron Up $2—Reinforcing Bars Short

Chicago, Oct. 14.—Production and shipment of soft steel bars in this district is on the increase, and each week sees a better total moving from mill to consumer. Users of steel bars are standing solidly behind the mills in the effort to combat present conditions and are not applying any pressure to obtain better deliveries. Up to this time practically all consumers have had sufficient material, relying in great measure on stocks which were accumulated before the strike and supplementing these with material being shipped currently. Effort of mills to deliver finished steel to consumers most in need is resulting in well-balanced distribution.

Heavy demand is being met for bar iron from manufacturers who can use it in place of steel and makers have advanced their quotation $2 per ton to 2.45c, Pittsburgh, the equivalent of 2.72c, Chicago mill. This change was made at the close of last week, and business has been booked at that level. In fact some bar iron has been sold as high as 3.00c, Chicago mill.

Hard steel bars rerolled from rails continue extremely strong, and some makers have sufficient business on books to keep them busy until the beginning of 1920.

Specifications Piling Up

Philadelphia, Oct. 14.—Steel bar makers whose plants are crippled by the strike report that specifications are piling up at a rate which will keep them out of the market for a long time after they resume operations. The leading maker continues to take business from regular customers but is handicapped in making promises as to delivery. Those plants not affected are proceeding carefully in taking new business, because of sold-up conditions. An eastern maker is obtaining 2.60c, Pittsburgh, for soft bars of forging quality, while the minimum for iron bars here is 2.50c, Pittsburgh. Sales are being made occasionally at 2.60c and 2.70c, Pittsburgh. Much bolt business is coming from shipyards. One yard during the past week placed 500,000 bolts and a corresponding number of nuts. Another yard is inquiring for 210,000 bolts, with a corresponding number of nuts. The Pennsylvania railroad has bought several hundred tons of track bolts.

Sales Reported at 2.80c

Pittsburgh, Oct. 14.—Makers of merchant steel bars generally are not producing more than enough to meet specifications against contracts and some who have been hampered by the strike cannot meet specifications. Demands from consumers not getting full shipments on orders are sharp and producers having tonnage available for prompt shipment can obtain substantial premiums over the regular market base. One company here, making both steel and iron bars, lately has been getting 2.80c, base, Pittsburgh, on immediate shipments. A Pittsburgh maker of concrete reinforcing bars recently closed on 1700 tons for a new building for the Cadillac plant of the General Motors Corp., Detroit, at a price in excess of 3.00c, Pittsburgh. This company was able to make prompt shipments and the buyer was willing to pay the premium to secure the bars. Principal producers of iron bars are holding to 2.75c, Pittsburgh, for common merchant iron and report the demand to be fairly good, with some buyers substituting iron for soft steel bars.

Concrete Bars in Demand

Cleveland, O., Oct. 14.—A very great demand for reinforcing bars is current, but buyers are having considerable difficulty to supply their wants, owing to the idleness of considerable mill capacity. Warehouse stocks have been drawn upon heavily to carry on building operations, but greater difficulty is now being experienced in doing this owing to the reduced supply of material available. Prices on reinforcing bars are strong, ranging from 2.50 to 3.00c mill. Consumers of soft steel bars, generally in this territory, do not seem to be suffering to a severe extent by the reduced deliveries from the mills.

Plans are being prepared for a building for the Templar Motor Car Co. to require 40 tons of bars.

Bolt Demand Heavy

Chicago, Oct. 14.—Manufacturers of bolts and nuts continue to meet heavy demand from consumers and with mill books carrying practically enough business to engage capacity almost to the end of the year, it is difficult to entertain more than a part of the inquiry. Production is going forward at a high rate and the situation is entirely satisfactory, with prices unchanged.

Bar and Rod Shortage Felt

Pittsburgh, Oct. 14.—Shortage of bars and rods is being felt by some makers of nuts, bolts and rivets but not to the extent of seriously affecting production. Demand is good for all three products and some makers have advanced their steel prices on nuts, quoting blank nuts at 2.50c off list and tapped nuts at a discount of 2.25c. Most makers, however, are holding to discounts of 2.85c on tapped and 3.10c on blank nuts.

Lack Normal Bar Supplies

Pittsburgh, Oct. 14.—Some makers of cold-finished steel bars and shafting whose source of supply of merchant steel bars temporarily is cut off by the strike, are somewhat hampered in the production of certain sizes. As a rule, however, the effect of the strike has been extremely slight due to the fact that the cold-finished steel interests were carrying fairly good stocks of bars before the trouble began. Steady expansion is reported in the demand for cold-finished steel with prices holding quite firmly at 3.60c, base Pittsburgh.

English Ferro

Sold at $103 Tidewater—Alloy Market Continues Quiet

New York, Oct. 11.—The most important development in the ferromanganese market during the past week has been the sale of 300 tons of English metal guaranteed to contain 76 per cent manganese, at a price equivalent to $103, c.i.f. tidewater, for delivery over November and December. There is considerable variation in price on English metal. On one inquiry for a round tonnage an importer quoted $100, c.i.f. tidewater. Another importer continues to ask $110, freight allowed. Domestic producers still quote $110, delivered, on 78 to 82 per cent metal. Current inquiry is confined largely to carload lots.

Demand for spiegeleisen has been of small proportions during the past week and involves mostly carloads. The market continues at $34 to $35, furnace, for 18 to 22 per cent metal. There is another inquiry out from Belgium for a round tonnage. Italian inquiry continues to come out. Considerable tonnage has been closed here by Italy in the past several weeks.

A contract for over 15,000 pounds of contained tungsten for shipment over the remainder of the year was closed at $1.25 a pound, delivered. This was imported alloy sold by a dealer and the price was about the same as quoted by domestic makers.

Competition for orders for 50 per cent ferrosilicon continues sharp. A car sold at $81, delivered eastern point, and another car offered at $82, delivered Pittsburgh, to a dealer, was not taken. A less than carlot, offered at $90, delivered East, was accepted. A car of 75 per cent ferrosilicon sold at $146.50, delivered eastern point.

The ferrochrome market continues irregular. The leading maker is said to be quoting 26 to 30 cents for next year's deliveries, but other makers are offering alloy containing 4 to 6 per cent carbon at 22 to 24 cents a pound contained for this year's delivery, this price meeting quotations on French offerings.

The ferrovanadium market shows little change. The leading maker is quoting $5.50 a pound contained for its high silicon product, while smaller makers are quoting above $6 on low silicon alloy. The Primos Chemical Co., whose plant was badly damaged by fire last spring, is reported to have resumed shipment of ferrovanadium.

A merger of ferroalloy interests is rumored, in which some leading interests are identified. If the project is consummated as proposed, it will be a notable development to the ferroalloy industries.

Little is Going On

Pittsburgh, Oct. 14.—Demands for ferroalloys are few and small, and actual selling values are not well defined. Ferromanganese is quoted up

to $110, delivered, for 80 per cent, but it is doubtful if $105 would be refused for either domestic or foreign material delivered in the Pittsburge district. This price appears to be minimum, although a report has been current here that brokers have made a bid of $95, c.i.f. Atlantic coast, for a liberal tonnage of English alloy. Doubt is expressed in some quarters as to the authenticity of this report, and as far as can be learned no business has resulted.

Sale of a few small lots of 18 to 22 per cent spiegeleisen, not for this market, are reported here at $34, furnace. Almost nothing has been done in 50 per cent ferrosilicon lately; this alloy nominally is rated at $80, furnace, freight allowed, but it is intimated that less is being accepted by some makers.

The market also is dull on bessemer ferrosilicon and it is believed that firm offers below quotations would at least be considered and possibly accepted by some makers. Low grade electrolytic ferrosilicon is being offered at prices that are competitive with bessemer ferrosilicon.

Prompt Steel

Wanted by Various Mills—Middlemen Ask Premiums—Inquiries Current

Pittsburgh, Oct. 14.—Current production of billets and sheet bars is hardly sufficient to meet the contract obligations of produecrs and a number of inquiries are on the open market, mostly for prompt shipment, for both kinds of steel. On one sheet bar inquiry amounting to 1000 tons a price of $51.50 was named by middlemen while premiums of $2 a ton on billets are frequently quoted. Makers of wire rods could dispose of considerable tonnage if they had it available.

Offers Billet Tonnage

Philadelphia, Oct. 14.—Because of some idle finishing capacity, one eastern mill now has some billet tonnage to offer in the open market,. No semifinished sales are reported.

Strip Business Normal

Pittsburgh, Oct. 14.—While some of the makers of strip steel in this district are somewhat hampered by the lack of common labor due to the strike, all of the plants are running and in some cases at full capacity. Deliveries of billets are improving as the steel plants increase their operations and in this respect the position of the strip steel interests was helped by the fact that they had fair sized stocks on hand when the labor disturbances began. New demands for strip steel are reported to be fairly numerous but are not getting much attention as booking are sufficient to absorb all production for the remainder of the year.

The financial statement of the Cockshutt Plow Co., Brantford, Ont., for the year ending June 30 last is the best in the company's history.

Many Boats Are Placed

Eastern Plate Mills Excited Over Reports of Contracts Calling for 20 to 25 Vessels—16,000 Tons Up for Pacific Coast

Philadelphia, Oct. 14.—The eastern plate market is excited by the great improvement in business and particularly in the number of new boat contracts which are being placed. The Union Shipyards of Baltimore has taken orders for two boats, the Bethlehem Steel Co. at Sparrows Point is reported to have seven or eight vessels, the Sun Shipbuilding Co. is reported to have five or six, and the Newport News Shipbuilding & Dry Dock Co. has closed for two. Most of these boats are tankers of large tonnage capacity. The mills report numerous orders for plates in lots of 3000 to 5000 tons each and many smaller ones. The Lukens Steel Co. is operating practically at capacity. It now has 14 open hearth furnaces in operation compared with 11 before the strike. All mills are adhering to 2.65c, Pittsburgh and one eastern maker has taken some car load orders from western consumers at 2.65c mill.

Vessels About to be Placed

New York, Oct. 11. — A large steamship interest with headquarters in New York has placed tentative orders for eight tankers with the understanding that the contract will be signed some time within the next two weeks. It is understood that these are 10,000-ton vessels, and that the contracts have been let with four Atlantic coast yards, not in this district, each to build two vessels. This is the biggest project which has come up of late affecting the plate market. About 25,000 tons are involved. Negotiations are proceeding for the letting of additional ships for a number of different interests, so that considerable plate business is forthcoming from this source. Plate demand has shown a marked improvement in this district during the past week, and the shading which was noted up to recently, has about disappeared. The market now is being maintained at 2.65c, Pittsburgh, or 2.92c, New York.

Fairly Well Sold Up

Pittsburgh, Oct. 14.—Good demands are coming to platemakers here from consumers whose regular source of supply is shut off and the mills have become fairly well filled up. Makers of tanks are the principal buyers, for they more than the other users of plates suffered from the curtailment of production incident to the strike. No business is being taken at less than 2.65c, Pittsburgh, and makers are taking only desirable tonnages at that figure.

Shipyard Places Tonnage

Cleveland, O., Oct. 14.—One of the local shipyards which recently inquired for 2500 tons of plates has closed for all or a part of this tonnage. Eastern mills which have been shipping into this territory on the basis of 2.65c, Pittsburgh have fallen behind in deliveries and now stipulate from six to eight weeks. Local production of plates has been resumed by the opening of the Otis Steel Co. plants.

Users Holding Back

Chicago, Oct. 14.—Producers of steel plates find a tendency on the part of consumers to remain out of the market and to avoid placing further tonnage on mill books or filing specifications against existing contracts. This is attributed in part to a manifest desire on the part of plate users to assist in the present strike and also a general feeling of unsettlement because of labor conditions. From the point of view of the mills, it would be preferable for specifications to be filed promptly that they might be in order as soon as full production is resumed. In spite of this attitude, considerable business is being considered and is passing into the form of contracts.

Tin Mills Gaining

Operations Working Up to Normal, Although One Plant Closes

Pittsburgh, Oct. 14.—Shutdown of the Yorkville, O., works of the Wheeling Steel & Iron Co. represents the only loss of the past week in tin plate mill capacity, and this to a considerable extent is made up in the total active mills by the starting of several mills of the American Sheet & Tin Plate Co., which now has about 55 per cent of its mills going. The Weirton Steel Co., Weirton, W. Va., also has increased its active mills considerably. At the Farrell, Pa., works of the American Sheet & Tin Plate Co., 24 out of the 30 mills are in operation, while the New Castle and Shenango works of this company both at New Castle, Pa., are running 100 per cent, which is somewhat higher than these mills were operating just before the outbreak of the strike. At Gary, Ind., 50 per cent of the tin mills are running. Suspension at the Yorkville plant of the Wheeling Iron & Steel Co. brings up anew the question of the value of a contract with the Amalgamated Association of Iron, Steel and Tin Workers. This plant has been kept in operation largely through the agreement, but on Oct. 7 the laborers, machinists and electricians employed there organized and presented a scale of wages to the company. A week was given the company to accept or reject the scale, but two days after the scale was presented the men went out and their action tied up the plant. Under the terms of the agreement, any craft organizing and formulating a scale is not to call a strike upon rejection by the company, the matter to be considered at the annual conference between the association representatives and the employers.

Building Work Proceeds

Liberal Tonnage Represented by New Structural Awards and Inquiries—10,000 Ton Hotel Up at Detroit

Cleveland, Oct. 14.—Demand for standard structural shapes is good, and building activity seems to be going forward again after a temporary lull due to unsettled labor conditions in the steel industry. One of the largest jobs being figured by fabricators, is the addition to the building of the Cleveland Trust Co., requiring 3000 tons. Bids are being taken on this job by the architect, George P. Post, through his New York office. It is reported that the general contract has been awarded but so far this has not been verified. Fabricators are expecting to figure soon on about 10,000 tons for the Biltmore hotel to be erected in Detroit, by John McE. Bowman, head of the Pershing Square group of hotels, New York City. A number of smaller jobs are being figured in the Cleveland district.

Building Operations Improving

Boston, Oct. 13.—According to building permits from the principal New England cities, residence construction gained decidedly during the first part of October. This has not affected structural steel companies as yet, but it indicates an improvement in other building lines. The tone of the market is better and owners are beginning to take the attitude that the steel strike is settled. Bids are being taken for the Beach telephone exchange building in Boston which will take 750 tons and for the New Bedford hotel, New Bedford, Mass., to take 300 tons. Plans are being prepared for a new office building in Hartford which will require about 3000 tons.

Lettings Reach Good Total

New York, Oct. 14.—While the large individual awards of the past week are lacking structural lettings in the East comprise a good total. The largest award to be noted involves 1750 tons for Continental Candy Co., Jersey City. Another sizeable award comprises 1000 tons for the Allerton apartment, Manhattan; another involving 700 to 800 tons is reported placed. Apartment house building, however, is not as active as two months ago. New inquiries only fairly numerous, a lot of 1100 tons for a hospital at Elizabeth being among the largest.

Eastern Mills Filling Up

Philadelphia, Oct. 14.—Eastern shape mills are filling up with orders, which are coming especially from jobbers and fabricators. Eastern mills are getting some orders which would be placed elsewhere, if it were not for the strike. An important development of the week is that some fabricating shops which were operating on this work, and were using allocated material, now apparently have made final adjustment with the Emergency Fleet corporation, and are again ordering plain material. Bids are expected to be taken soon on a large office building for the Atlantic Refining Co.

Shape Mills Not Pressed

Pittsburgh, Oct. 14.—Shape mills in this district are not crowded with business, although the fabricating shops are fairly well off in the matter of bookings. Inquiries still are coming out for substantial tonnages of fabricated steel, but actual lettings have been few and small lately, probably because investors feel this to be a poor time to go ahead on account of the unsettled labor situation. Steel for the car shops of the Pennsylvania railroad at Stark, O., 400 tons, has been awarded to the McClintic-Marshall Co., which also has taken 800 tons for the General Motors Co., Detroit. Plain material prices are firm, but the market still leans in favor of the buyer on fabricated steel.

The regular monthly meeting of the Bridge Builders and Structural society was held at the William Penn hotel here last Friday. It is understood that the labor situation was the chief topic of discussion.

Good Tonnage is Placed

Chicago, Oct. 14.—Various projects calling for fabricated steel material which have been hanging fire for some time are coming through, providing excellent tonnage for fabricators and structural mills. The contract for steel for the John Crerar library building in Chicago, 1450 tons, which has been before the market several months, has been awarded to the American Bridge Co. An inquiry is out for 500 tons for a bridge over Red river, connecting Paris, Tex., with Hugo, Okla. Plain material prices are well maintained at 2.72c, Chicago.

CONTRACTS AWARDED

Building for Cleveland Rubber Corp., Cleveland, 711 tons; to T. H. Brooks & Co.

Building for Parish & Bingham Co., Cleveland, 850 tons; to McMyler-Interstate Co.

Machine shop extension for Ball Engine Co., Erie, Pa., 125 tons; to Fort Pitt Bridge Works.

Factory for Ace High Chocolate Co., Boston, 190 tons, to W. A. Root, Inc.

Building for John Crerar Library, Chicago, 1450 tons, to American Bridge Co.

Freud Hotel building, Detroit, 1186 tons, to Russell Wheel & Foundry Co., Detroit.

Warehouse and office building for the Marshall Wells Co., Duluth, 284 tons, to the National Iron Works.

Steel trestle for supporting coal handling towers at Superior, Wis., for the Northern Coal & Dock Co., 192 tons, to the Northwestern Bridge Co., Milwaukee.

Salt River bridge, for Gila country, Ariz., 133 tons, to El Paso Bridge & Iron Co.

Building for Continental Candy Co., Jersey City, 1700 tons to Hay Foundry & Iron Works.

Allerton apartment, New York City, 1000 tons to Passaic Structural Steel Co.

Building for Southern Stove Co., Richmond, Va., 300 tons; let to independent.

Extension to Watervliet arsenal, Watervliet, N. Y., 250 tons; let to American Bridge Co.

Buildings for New Jersey Zinc Co., Hazard, Pa., 300 tons; let to independent.

Addition to machine shop and foundry of Lewis Steel Products Co., Toledo, O., 150 tons to Northwestern Bridge & Iron Co.

Addition to Oxford Paper Co.'s plant, Rumford, Me., 300 tons; let to Megquier & Jones.

Crane runways for Worthington Pump & Machine Co., Harrison, N. J., 200 tons; let to independent.

Mill building for Manomet Knitting Co., Lawrence, Mass., 700 tons; let to American Bridge Co.

New York state power plant, Troy, N. Y., 600 tons; let to West Side Structural Co., New York.

Bridge for Chesapeake & Ohio railroad, 100 tons; let to Mt. Vernon Bridge Co.

Building for the Atlantic Land Co., Pittsburgh, 225 tons to the Jones & Laughlin Steel Co.

Building for the Fowler Nail Co., Buffalo, 400 tons to the Jones & Laughlin Steel Co.

Garage for the Shaw Motor Co., New Kensington, Pa., 100 tons to the Jones & Laughlin Steel Co.

Building for car shop Pennsylvania railroad, lines west, Stark, O., 400 tons to the McClintic-Marshall Co.

Building for the General Motors Corp., Detroit, 800 tons to the McClintic-Marshall Co.

Bank building for the First National Bank, Marietta, O., 150 tons to the McClintic-Marshall Co.

CONTRACTS PENDING

Addition to Cleveland Trust Co.'s building, Cleveland, 3000 tons; bids being taken.

Warehouse for Jordan Motor Car Co., Cleveland, 300 tons; bids being taken.

Detroit Biltmore hotel, Detroit, 10,000 tons; bids to be taken soon.

Telephone building for New England Telephone and Telegraph Co., Boston, 750 tons, bids in.

Hotel for New Bedford Hotel Co., New Bedford, Mass., 300 tons, bids in.

Bridge over Red River connecting Paris, Tex., with Hugo, Okla., 500 tons. Bids asked.

Hospital, Elizabeth, N. J., 1100 tons, bids being taken.

Addition to Connecticut Metal & Chemical Co.'s plant, East Berlin, Conn., 300 tons; bids being taken.

Public schools No. 43 and 83, Manhattan, N. Y., 500 tons; bids being taken; general contract let to Connors Bros., New York.

Buildings for West Virginia Metal Products Co., Fairmont, West, Va., 1300 tons; bids being taken; general contract let to F. T. Ley & Co.

Addition to plant of Carpenter Steel Co., Reading, Pa., 600 tons; bids closed.

Repairs Short

On Railroads Because Strike Wipes Out Meager Reserve of Material

Chicago, Oct. 14.—While consumers of steel products in general have sufficient material to carry them for some time, railroads in many instances find themselves short of rails, track fastenings and other steel material necessary for current repairs. This situation comes about from the fact that railroad buying at present is being done in a hand-to-mouth way which prevents accumulation of any stock to meet an emergency. As a result the present strike situation has left them without reserve and even the most urgent repairs must be neglected in many instances. C. E. Sharp, St. Louis, has issued an inquiry for 50 steel cars for Mexico.

Foreign Countries in Market

Philadelphia, Oct. 14.—It is reported in the car market here that China is in the market for 1000 cars, Belgium for a large number, estimated at 10,000 to 20,000, and another country for a large number. The New York Central railroad, Chesapeake & Ohio, and other roads have placed substantial orders for car repairs and car-repair parts.

Trend of Export Trade Changing

Larger Producers Now Offering to Accept Foreign Sales Contracts — Deliveries Dependent Upon Settlement of Strike — Sales Much Larger Than Shipments — Oriental and South American Inquiries Heavy

NEW YORK, Oct. 13.—Delays to shipments due to the strike have curtailed materially exports of iron and steel during the past month. The actual cleared exports during both September and October, it is now reckoned by trade authorities, will be far below the total foreign sales made during either month. The strike of workers in the mills was the first check to deliveries, then the British railroad strike held up the departure of the great majority of ships. Now the longshoremen at New York, who handle the bulk of export shipments, are tieing up the foreign trade movement. These delays are costly and the effect has been a temporary increase in prices quoted to foreign inquirers for American iron and steel.

On the other hand, it is declared by the vast majority of export houses, that there has been no diminution in business. The United States Steel Products Co., is estimated to be doing a foreign business of at least 250,000 tons a month, while the Consolidated Steel Corp., is selling around 100,000 tons. A conservative estimate would be that the American producers are selling abroad at the rate of 400,000 tons a month, but it is believed by many trade authorities the actual figure would be much larger than this.

Purchasing agents declare they have been able to fill their immediate wants with the smaller independent mills, not affected by the strike, and in some instances they have been given prices below those quoted by the Steel corporation.

The trend of the market, however, is more conservatively reflected in the activities of Steel Products and the Consolidated companies. A week ago neither of these agencies was willing to make a quotation. It is now learned that one has offered to take an order to be filled "at mills' convenience." The other has offered to accept a new foreign order for filling two to three months after the settlement of the strike.

Exporters have paid a premium of $5 a ton on wire and from $3 to $5 on sheets. Foreign sales of wire have been extremely heavy and exporters have been compelled to purchase from warehouses. The sheet market, they say, has been crowded by the demands of the domestic automobile makers. Bars are also scarce in the export market, while foreign demand is large. A premium is demanded on bars and purchases are being made on the base of 2.50c Pittsburgh. Reports have been current in this market of prices as high as 2.70 and 2.80c on bars.

South American railroads hold out one of the best opportunities for American steel. Negotiations are still on between representatives of the Latin-American countries and New York bankers looking toward the granting of credits under which orders for rails and pipe will be put through. South America has continued its purchases of wire, rods, structurals, tinplate, sheets and pipe. One house reports the sale of 800 tons of structurals. Small sales of boiler tubes and pipe have been made in Cuba. South America has sent in a number of new inquiries for wire, the individual inquiries being in small tonnages. Inquiries for 5000 tons of rails and 800 tons of foundry iron have been received. Japanese purchasers in this country declare that the market in Japan is growing weak in one or two particular lines, and one cancellation of an American order of minor importance was reported. Japan has so far this year placed orders for probably more than 400,000 tons of plates and shapes for shipbuilding. During the past week a new contract was signed for a few thousand tons of sections and plates for shipbuilding. It was declared by the purchasing agent that this material was purchased from small independent mills at a price 10 cents below that of the Steel corporation.

Another Japanese purchaser declared that he has experienced some difficulty in placing orders since the strike and that quotations have been advanced 3 per cent. He has, nevertheless, bought sheets, bars, galvanized wire, rods and tinplate in quantities from 20 to 150 tons. The same agent is now trying to purchase similar goods varying in size from 100 to 200 tons. Another Japanese purchaser declared that he was compelled to purchase 50 tons of wire out of stock because he could find no American mill willing to deliver. An order for 1000 tons of plates was placed. This Japanese house is now in the market for 100 tons of sheets and 1500 tons of structurals.

Other houses report the sale of small tonnages of ship and tank plates, rods, light rails and shapes to China. Inquiries are now out for approximately 60,000 tons of basic pig iron for Japan. Japanese purchasers have been able to place an order for 5000 tons and another for 1000 tons of iron. A previous order for 5000 tons makes a total of approximately 10,000 tons sold within the past 10 days. Japan also is inquiring for several thousand tons of foundry iron. The Japanese have closed for some foundry iron in the south on the basis of $28, Birmingham, for 1.75 to 2.25 silicon, while in some instances $28.50, Birmingham, was obtained for this grade.

Although European business is considered as nil, England has continued her inquiries for billets. A number of American houses are bidding on the big sluice gates to be built in South Africa at a cost of approximately $1,000,000, and are also bidding on the $3,000,000 Danube bridge projected by Rumania. Satisfactory arrangements have been made for credits, and the business is looked upon as assured to American producers.

An interesting order which has just been placed involves about 200 tons of shapes which will be shipped to France for repairing damaged wind mills in Belgium and France. Interest in European prospects, however, is waning as producers in those countries rebuild their plants. According to information now in this market, signs of German competition in the steel trade of Europe has already appeared. One case was cited where an American bid for a French machine tool order amounted to 1,800,000 francs, whereas the Germans offered to fill the order for 450,000 francs. This great disparity in prices was evidently due in part to the depressed rate of exchange.

A British inquiry for 10,000 tons of low phosphorus pig iron has been received. A Belgian consumer wants 5000 tons of the same grade. A Belgian inquiry for a round tonnage of spiegeleisen also has been received. A Scandinavian buyer wants 1000 to 2000 tons of foundry iron. Italy continues to inquire for spiegeleisen.

Thousands of Strikers Returning

Stampede in Pittsburgh District Prevented Only by Organizers Holding Out Promise of Favorable Report by Senate Committee—Backbone of Disturbance Broken —All Districts Report Increase in Operations

CONTINUED improvement in the strike situation is reported from Pittsburgh, Chicago, Youngstown, Cleveland and Buffalo, the principal districts affected, while elsewhere the strike has virtually passed into history. Operatives in the districts named believe the backbone of the strike is broken, basing their opinion on the ever-increasing number of men returning to work.

The movement in the Pittsburgh district is so strong, it is reported, that organizers are preventing a stampede only by the most strenuous efforts, informing the men that the senate committee on education and labor will report the results of its investigations in a few days and pave the way for the return of all the men who went out on strike.

More than 500 men returned to work in one day at the Gary plant of the Illinois Steel Co., while 800 reported for work at the plant of the Wisconsin Steel Co., South Chicago. In Cleveland the first break in the strike came with the return of employes of the Otis Steel Co., enabling the company to operate its Lakeside and Riverside plants. Operating conditions are improving throughout the Mahoning valley.

Strike in Pittsburgh District Wearing Out

PITTSBURGH, Oct. 14.—Slowly but steadily the steel strike is wearing out. It was a flat failure in this district, in that comparatively few plants were compelled to suspend operations and all are now running, while those which are crippled are steadily getting back to normal as the men continue to return. Strikers are reporting for work in plants all through the Pittsburgh district, and apparently all that is preventing a stampede is the fact that the organizers are telling the men that the senate committee which has been investigating the strike will settle it, and all will be able to go back in a few days.

It is the general belief that the cause of the strikers suffered by the recent visit to Pittsburgh of the senate committee, and beyond the possibility of the introduction of an Americanization bill by that committee, it is believed nothing is likely to result from the investigation and hearing. One notable feature of the hearing here was the absence of both William Z. Foster and John Fitzpatrick, who were in charge of the strike. Admission by one of the organizers that it was the organizers and not the men who insisted upon going through with the walkout over the President's request for a postponement damaged the strikers' cause.

The American Association of Iron, Steel and Tin Workers, which would have benefited most by the success of the strike, appears to be likely to come out of the trouble weaker instead of stronger. Its agreements with the manufacturers have only in a few instances kept the plants going, and not a few of the companies which had signed up considered that the contracts have been rendered void by the failure of the Amalgamated to fulfill its part of the deal. At the hearing by the senate committee last week it was testified that one of the articles of the agreement provides that failure by the employer to accept the scale presented by newly organized crafts in mills working under the agreement shall not be cause for a strike, but that the new plant must await the annual conference between the manufacturers and the Amalgamated representatives for an adjustment.

Statistics submitted to the committee showed that the Duquesne plant of the Carnegie Steel Co., had 6075 foreign-born workmen on Aug. 1, of whom 3354, or 55.2 per cent were naturalized, 362 or 5.9 per cent had first papers, and 2359 or 38.9 per cent were unnaturalized. Of the 459 who went out on strike, 48 were citizens, 44 had first papers and 346 were unnaturalized.

Workers Now Protected, Return at Chicago

Chicago, Oct. 14.—Conditions in steel mills in the Chicago district are distinctly better, and many observers believe the next five days will see the struggle virtually ended. At the Gary plant of the Illinois Steel Co., this morning more than 500 workers returned after being away since Sept. 22. At the plant of the Wisconsin Steel Co., South Chicago, which has been closed by agreement, more than 800 men reported for work, and the remainder are expected back within a few days. Operations at the South works of the Illinois Steel Co. continue to increase as more men return. Unloading operations at the ore docks at the South works have been suspended, but part of the crew has returned and is being organized to handle cargoes now in the harbor. At Gary the ore docks have been manned continuously, and last week seven large cargoes were unloaded. Several smaller boats have been held in the harbor, and will be placed under the unloaders when opportunity affords.

The Inland Steel Co. is organizing its force and beginning to produce steel. One blast furnace has been put under burden and is producing pig iron. The other two are undergoing repairs and will not be relighted immediately. Since troops took charge at Gary and Indiana Harbor, the situation has improved greatly and men who desire to return to their duties are not restrained in the same way as formerly. The present week is expected to see larger forces in every department.

Operations Resumed by Otis Steel Co.

Cleveland, Oct. 14.—Strike conditions are considerably improved in the Cleveland district. The first important break in the ranks of the strikers occurred Monday, when many employes of the two plants of the Otis Steel Co. returned to work. At the Lakeside plant of the company more than 400 men reported, while

at the Riverside plant about 800 men returned. At the H-P nail works of the American Steel & Wire Co., conditions are gradually improving, and at present about 380 men are at work. This number is being added to daily, officials state. No effort is being made to operate the plant of the Lake Erie Bolt & Nut Co., although a considerable number of the men have returned. At other plants in the district no activity has been reported, officials of these companies preferring to let their plants remain idle for the present.

The spread of the strike to the finishing plants which was reported last week, has been checked. About half the men who went on strike at the plant of the National Screw & Tack Co. have returned to work. At one plant of the Cleveland Hardware Co., where a similar strike had been called, production is normal. At the company's second plant many of the strikers have returned.

Repeated efforts of union organizers to cause a strike at the plant of the National Tube Co., Lorain, O., have failed.

Increasing Operations in Mahoning Valley

Youngstown, O., Oct. 14.—Operating conditions show considerable improvement throughout the Mahoning valley. The Trumbull Steel Co., Warren, O., now has 16 hot mills, the strip mills and three open-hearth furnaces at its Warren plant, and several hot mills at its Leavittsburg, O., plant in operation. These plants are operated under agreement with the Amalgamated Association of Iron, Steel & Tin Plate Workers. The workmen affiliated with this association were asked by President Tighe to abide by their contract with the Trumbull company. The company resumed operations in its various departments under the same conditions that existed prior to the closing of its works. The policy of paying rates equal to those prevailing for similar positions in other Mahoning valley mills will be continued according to W. H. B. Ward, vice president of the Trumbull company.

Two open hearths at the plant of the Brier Hill Steel Co. are now in operation, the furnaces having been tapped late Sunday evening for the first time since the walkout. A large number of workmen entered the mills Monday and efforts will be made to start additional furnaces. One of the plate mills of this company, about two miles north of the steel works, began rolling Monday. The switching crews of the Erie railroad, however, have refused to move cars into the plant, according to reports coming from strike headquarters.

The No. 4 stack of the Republic Iron & Steel Co., at Haselton is now in blast and it is expected that operation at the open-hearth plant will be resumed this week. The Brown-Bonnell and bessemer departments of this company remain inactive. The Youngstown Sheet & Tube Co. will make efforts this week to start its bessemer, open-hearth and sheet departments. Four hot mills at the Lowellville plant of the Sharon Steel Hoop Co. resumed Wednesday. The sheet mill crews at this plant are affiliated with the Amalgamated association.

Demurrage charged to the various steel companies here has decreased since the strike occurred. The Industrial Association of Traffic Managers held a meeting in Pittsburgh Tuesday to discuss the legitimacy of demurrage charged the steel companies under present conditions. It is felt that some action should be taken by the interstate commerce commission to suspend the charges during the strike. The matter recently was presented to the regional directors at their Chicago meeting but on account of their time in office being doubtful, only minor action is expected from this source.

Mills at Canton, O. Show Gain in Operations

Canton, O., Oct. 14.—More activity in steel mill operations is being shown here than at any time since the strike began. At the plant of the Canton Sheet Steel Co., the sheet mills began rolling Monday morning, and by noon practically 100 per cent operation was being maintained, according to an announcement by C. A. Irwin, president. The plant of the American Sheet & Tin Plate Co., is running at approximately 80 per cent, according to a statement issued by the plant manager, W. A. Harris. Several men returned for work in the tube department at the plant of the Timkin Roller Bearing Co. Repairs to steel mill equipment are being made and it is expected this department will get underway soon.

I. W. W. Agitators Busy on Ore Ranges

Duluth, Oct. 14.—I. W. W. agitators are endeavoring to stir up trouble among miners at various points on the iron ore ranges. At Ely 200 strikers endeavored to picket the mines of the Oliver Mining Co., but were dispersed by police. No miners have gone on strike in the other districts. Conditions continue normal at the Minnesota Steel Co.'s plant in Duluth.

Every Department of Mills in Alabama Busy

Birmingham, Ala., Oct. 14.—Every department of the steel mills of the Tennessee Coal, Iron & Railroad Co., and the American Steel & Wire Co., subsidiaries of the United States Steel Corp., in this district, is in full operation. Some of the foreigners who were not reinstated now are seeking work elsewhere. Production is greater than it was a month ago.

More Men Return to Work in Buffalo District

Buffalo, Oct. 14.—More workmen have returned to the plants of the Lackawanna Steel Co., and the Donner Steel Co. A blast furnace started last week at the Lackawanna plant continues in operation. Pickets are making an effort to get men out at the Buffalo Union furnace but have failed. Laborers have begun unloading four ore carriers lying at the Rogers, Brown & Co.'s slip since the beginning of the strike.

Wisconsin Mills Are Again in Operation

Milwaukee, Oct. 13.—With the return of a large percentage of striking employes during the past week and a considerable part of those remaining out reporting for work on Monday, the Bay View mills of the Illinois Steel Co., in Milwaukee, are again operating at a satisfactory rate. The stack which was blown out a few days after the trouble began Sept. 22 was relighted during the week. The other stack was not operating at the time. Only a comparatively few workmen were brought here from other cities by the Illinois Steel Co. At the offices of the plant it is stated that the trouble is virtually over.

Wage Increases Greater Than Cost of Living

Average weekly earnings of employes in the metal industries increased 88 per cent from September, 1914, to March, 1919, while the cost of living increased but 61.3 per cent from July, 1914, to March, 1919, according to a report issued by the National Industrial Conference board.

Average wages of men in eight lead-

ing industries as measured by average hourly earnings increased from 74 to 112 per cent, while increases in weekly earnings ranged from 62 to 110 per cent. The increase in hourly earnings in the metal industries was 74 per cent. Average hourly earnings in the various industries represented in March were as follows: Metal, 50.2 cents; cotton, 38.9; wool, 40.5; silk, 45.3; boots and shoes, 53.9; paper, 45.0; rubber, 61.2; chemical, 49.0.

The board states that the highest percentage of increase was recorded in the industries which paid the lowest wages, and vice versa. "Thus hourly earnings of male workers in cotton manufacturing increased over 100 per cent as against an increase of about 70 per cent for male workers in the metal manufacturing industries," it reports.

Referring to the comparison of increases in wages with increases in the cost of living, the board states: "This indicates that these workers were in general able to maintain and even to improve their standard of living prevailing in 1914."

Bethlehem's Machinists Return to Work

New York, Oct. 15.—Striking members of the machinists' union have returned to work at the Bethlehem Steel Co.'s plants. With machinists at work, Bethlehem officials estimate that their total force is 98 per cent of normal.

Senate Body Urges Americanization

WASHINGTON, Oct. 13.—Returning Monday from Pittsburgh, where they investigated the steel strike, members of senate committee on education and labor, declared some legislative plan for Americanization is necessary. Senators expressed amazement at the great proportion of foreigners on strike who are unable to speak the English language. They were gratified at living and working conditions of steel employes and wages paid them.

Plans for legislation for Americanization will be discussed at a meeting this week, perhaps Thursday. The committee has in mind the bill of Senator Smith, Georgia, member of committee. This measure would direct the secretary of the interior to co-operate with the states in the education of illiterates. Senator Kenyon, in a statement issued today, said the committee hopes for action by congress at this session. Other members are doubtful that such legislation can be acted on at this session. The judiciary committee has discussed a plan to have congress authorize the department of justice and the department of state to issue rules and regulations to govern immigration. It is contended that immigration could be restricted so that only desirable immigrants would be allowed to enter the country. Senator Walsh has suggested that it might be well to pass legislation making it compulsory for immigrants to learn the English language within five years after their arrival.

Senator McKellar said that both living and working conditions of steel employes were good, and better than he expected to find them. Wages, he said, also are sufficient and should not be cause for complaint. Senator Sterling expressed similar views, but was not sure that an 8-hour day, which Senator McKellar thought might be inaugurated in all departments, would prove satisfactory to the workmen, who wish to work overtime.

Senator Kenyon declared every citizen should do his part to correct the present condition under which 500,000 people, in this country for more than 10 years, cannot read or write the English language. Neither he nor any other member of the committee would discuss the merits of the strike, although it is believed the committee, or at least a majority of its members, is not in sympathy with the strikers. Some members think the Pennsylvania state constabulary conducted itself well, but that in some instances it was too abrupt and rough.

Senator Sterling declared the cause of labor is not being promoted by activities of such men as Foster and Fitzpatrick, whom he vigorously assailed. Gompers, he said, in approving of radical action, has "bowed to the storm," and unless Gompers repudiates the radicals the public will lose confidence in him as a safe leader of labor.

Gompers' Resolution Likely to Fail

WASHINGTON, Oct. 14.—Rules governing the national industrial conference so entangled the debate today that the session this afternoon adjourned just as the question was called for a vote on Samuel Gompers' resolution to have a committee appointed to arbitrate the steel strike. Gompers made the only speech for or against his resolution, and during the course of his address he practically conceded defeat of the strike, admitting that if it fails the organized labor movement may as well suspend.

Gompers' speech was characterized by many as the speech of his life, and immediately following it Gavin McNab, of the public group, a strong believer in arbitration, moved a postponement of the vote until next Friday. A vote was finally reached on McNab's motion and it was defeated. This brought the conference to a point where the rules again conflicted with progress and another adjournment was taken, this time until Wednesday morning. Unless something unforeseen develops between now and that time a vote on the Gompers resolution will no doubt be taken and the latter will be defeated.

Dr. Charles W. Eliot, tried to have the Gompers resolution ruled out on the point of order that the resolution was not in conformity with the purpose the President had in mind in calling the conference. Chairman Lane, however, declined to rule it out and when he called for debate Gompers made his speech, which was a summing up of labor's demands.

During Gompers' speech he declared that labor's willingness to have the strike arbitrated was in effect leaving the matter in the hands of four opposed to labor and two in favor of it. This was taken by some to be an admission that labor recognizes itself as opposed to the public interest. He also said that should the employers defeat organized labor in this strike it then will have other forces to contend with which will be less lenient. This was taken to be a recognition of the advancing power of the I. W. W. in the ranks of labor.

Auburn, N. Y., Twine Mill Council and Auburn Works Council of International Harvester Co.

Works Council Serves as Court

Equal Representation for Employes and Company Provided in International Harvester Co.'s Method for Establishing Spirit of Mutuality—Right of Appeal and Arbitration Among Important Features of Plan

DISTINCT contribution to the new era of industrial administration has been made by the International Harvester Co. in the inauguration of one of the most comprehensive plans of employe representation thus far formulated in the evolution of relations between capital and labor in America. This plan, adopted last March by an overwhelming majority vote in 19 of its 20 plants, is described by the company as a progressive development of its industrial program and as recognition of the desirability of mutual and equal determination by the employes and the management at each plant of the policies governing their relations.

Although experience with the new plan necessarily has been brief, both the management and the workers profess entire satisfaction with the results it has actually produced, as well as with its promise for the future. It has proved mutually beneficial to the company and the employes, to the former because it holds the promise of increased production and efficiency, and to the latter because they are receiving benefits and consideration impossible of attainment under the old system.

What is the precise nature of the plan that is proving successful both from the standpoints of the company and the employes? It was submitted to the workmen for a vote with the following introduction:

"The directors and officers of the company have for some time been working out a plan to establish closer

COUNCIL AT TRACTOR WORKS OF THE INTERNATIONAL HARVESTER CO., AT CHICAGO

relations between the employes and the management. To this end they now offer the following Harvester industrial council plan for the consideration of its employes, hoping that it may meet with their approval."

Works Councils Established

The plan created at each plant adopting it a works council in which representatives elected by the employes have equal voice with representatives appointed by the management in the consideration of matters of mutual interest. Every employe is guaranteed the right to present any suggestion, request or complaint and to have it promptly considered and fairly decided. Effective machinery for appeal and for the settlement of works council deadlocks is set up. Impartial arbitration by mutual consent is provided for in case agreement is found impossible.

The plan is composed of 20 articles. In the first article is set forth the doctrine of equal representation in the consideration of all questions of policy relating to working conditions, health, safety, hours of work, wages, recreation, education and other similar matters of mutual interest.

The second, third, fourth and fifth articles deal with the method of organization of the works council. The basis of representation is fixed at one employe representative for each 200 or 300 employes, with the provision that in no case shall there be less than five employe representatives in the works council. In each council the number of management representatives shall not be greater than the number of employe representatives and both have at all times equal voice and voting power in considering matters coming before the council.

To aid in carrying out the plan the company established a department of industrial relations, which is charged with the duty of giving special consideration to all matters pertaining to labor policies and the well-being of the employes.

The draft of the plan describes the qualifications of an employe representative in the following words:

"To be eligible for nomination as employe representative from any voting division, the employe must be employed therein. Foremen, assistant foremen, and other employes having the power of employment or discharge shall not be eligible for nomination. Only employes who are citizens of the United States, 21 years old or over, and who have been continuously in the works service for one year immediately prior to nomination as shown on the records of the employment department shall be eligible for nomination as employe representatives."

The next section outlines the methods of nomination and election of employe representatives, the men first nominating candidates and then voting on the two names receiving the highest number of votes. After the employe representatives have been chosen the company announces its representatives on the council.

Once organized the works council affords full opportunity for presentation and discussion of all questions relating to working conditions, wages, protection of health, safety, hours of labor, recreation and similar matters. Upon its own initiative the council may institute investigations of matters of mutual interest and make recommendations thereon to the works management. Similarly the management may refer matters to the council for investigation and report.

Employes' Rights Safeguarded

One significant and important feature of the plan is the provision for conferences between the council and the superintendent in regard to all matters of mutual interest and another is that the council shall receive from the management regular reports regarding accident prevention, sanitation, restaurant, medical service, employment, educational programs, and recreational activities, including information as to the cost, efficiency and results obtained.

The text of the plan makes it clear that the works council shall be concerned solely with shaping the policies of the company relating to the matters specifically mentioned. It is added that when the policy of the company as to any of these matters has been settled its execution shall remain with the management, but the manner of that execution may be at any time a subject for the consideration of the works council.

Ample safeguards are provided to guarantee any employe or group of

THE HAMILTON, ONT., WORKS COUNCIL OF THE HARVESTER COMPANY

employes opportunity to appear before the council and present their case. Any such group of employes shall select not more than three spokesmen from their own number to appear before the council. The council may call any employe before it to testify regarding any matter under consideration and the members of the council, or any sub-committee, may go in a body to any part of the plant to make investigations.

The plan provides a method of voting on matters under consideration and sets up machinery for appealing to the president in cases of tie votes, and for reference to a general council or for arbitration, in the event a compromise settlement is not reached. The sections describing these details together with an explanation of the organization and functions of the general council follow:

"After complete investigation and full discussion of any matter under consideration by the works council, the chairman shall call for a vote, which shall be secret, unless otherwise ordered by the council. The employe representatives and the management representatives shall vote separately. The vote of a majority of the employe representatives shall be taken as the vote of all, and recorded as their unit vote. Similarly, the vote of a majority of the management representatives shall be taken as the vote of all and recorded as their unit vote.

Provides for Arbitration

"Both the employe representatives and the management representatives shall have the right to withdraw temporarily from any meeting of the works council for private discussion of any matter under consideration. When the works council reaches an agreement on any matter, its recommendation shall be referred to the superintendent for execution, except that if the superintendent considers it of such importance as to require the attention of the general officers, he shall immediately refer it to the president of the International Harvester Co. who may either approve the recommendation of the works council and order its immediate execution by the superintendent or proceed with further consideration of the matter.

"In case of a tie vote in the works council, it shall be in order to reopen the discussion to offer a substitute or compromise recommendation, on which the votes shall be taken in the same manner as above provided.

"The president, or his specially appointed representative, may confer with the works council as a whole, or any subcommittee thereof, or any group of employe representatives, at such time and place and in such manner as in his opinion will best serve to bring out all the facts of the case.

"Within ten days after the matter has been referred to him, the president shall either (a) propose a settlement thereof; or (b) refer the matter directly to a general council. If the settlement proposed by the president is not satisfactory to a majority of the employe representatives, and if after a further period of five days no agreement has been reached, then the president may, if he deems it advisable, refer the matter to a general council.

WORKS COUNCIL AT WISCONSIN STEEL CO., SOUTH CHICAGO WORKS OF INTERNATIONAL HARVESTER CO.

"If the president decides not to refer the matter to a general council, or if the vote of the general council is a tie, then the matter may, by mutual agreement of the president and a majority of the employe representatives, be submitted to arbitration. The general council shall be formed in the following manner: The president shall issue a notice designating the several works which he deems jointly interested. Thereupon the employe representatives in the works council at each of the works designated shall select two or more of their own number to act as members of the general council. There shall be one such member of the general council for each 1000 employes or major fraction thereof, except that no works shall have less than two representatives in the general council.

"The management representatives in the general council shall be appointed by the president and shall not exceed the number of employe representatives.

"The president or some person designated by him shall act as chairman of the general council, without vote.

"The first meeting of the general council shall be held within ten days after the president's notice calling such council.

"The general council shall, when necessary, take recesses in order to allow employe representatives therein to confer with other members of their works councils. For this purpose special meetings of the works councils as a whole, or of the employe representatives alone, shall at the request of the employe representatives serving on the general council be convened at the respective works, and full opportunity shall be given for conference and discussion with such representatives regarding their attitude and action on the pending matter."

Representative Protected

In the event of a disagreement in the general council on any matter, it may by majority vote of both management and employe representatives be submitted to arbitration. The method of selecting the arbitrator is for the employe representatives to make a choice and the president to do likewise. If these two agree, their decision shall be final. If they do not agree, they shall call in a third arbitrator and a decision of the majority of these three shall be final.

Perhaps one of the most important features of the plan is that which guarantees the independence of the employe representative and safeguards him against discrimination on account of any action taken in good faith in his representative capacity. He is given the right to appeal directly to the president for relief from alleged discrimination, and, moreover, if the president's decision is not satisfactory to him, recourse may be had to arbitration.

Under the new plan there can be no discrimination against any employe because of race, sex, political or religious affiliation, or membership in any labor organization. The constitution provides that decisions affecting wages shall be subject to revision whenever changed conditions justify, but not oftener than at intervals of six months.

Discuss Economy at Fall Meeting

Iron and Steel Institute Presents 1919 Bessemer Medal to Italian Metallurgist—Consider Advantages Gained by Establishing Coke Ovens, Blast Furnaces and Rolling Mills in Close Proximity

UNUSUAL interest attended the autumn meeting of the Iron and Steel institute held at London, England, Sept. 18 and 19 when the subject of fuel economy with special reference to steel works and foundry practice was thoroughly discussed. The economies effected in German steel works were outlined in one of the papers.

Sir Robert Hadfield, who presided in the absence of President Eugene Schneider, announced that the Prince of Wales has consented to become an honorary member of the institute. Dr. Hadfield presented to Dr. Cav. Federico Giolitti, Turin, Italy, the Bessemer medal for 1919 in recognition of his eminent metallurgical services. Dr. Giolitti is a son of a former Italian premier, and has done most useful work in connection with the development of new processes for the cementation of steel and for the heat treatment of mild steel as a medium for hard steel in machine construction.

The remainder of the morning and afternoon sessions were devoted to the reading and discussion of papers on fuel economy. George Ainsworth presided at the afternoon session in the absence of Sir Robert Hadfield. The papers were prefaced by the reading of a letter from Dr. George Beilby, as follows:

"As vice chairman of the carbonization and metallurgical subcommittee of Lord Haldane's coal conservation committee, I am deeply interested in the idea put forward in the report of the committee by Benjamin Talbot and Professor W. A. Bone on the establishment of steel works comprising coke ovens, blast furnaces and rolling mills all situated in such close proximity that the heat and power supplies can be pooled and drawn upon with the maximum economy by each and all of the separate departments. I venture to hope that we shall learn from the discussion that steps are being taken to develop this statesmanlike proposal."

Suggests Efficiency Certificate

With regard to training skilled workmen to appreciate the importance of fuel economy, Dr. Hadfield said that experience in his own company's works has been quite gratifying. Whenever the question of fuel efficiency has been properly placed before the worker he has quickly responded and endeavored to assist his employer. He also stated that in this connection the federation of British industries is glad to assist by lectures, distribution of pamphlets and other means which can be used as educational propaganda in various industries. It was also suggested that efficiency certificates and prizes might be introduced.

Referring to the question of coal output, Dr. Hadfield said, "While speaking of America, may I say that several have asked how it is that coal output per man in America is so much more than in England. It must not be forgotten that many American collieries are not hundreds of yards, but only hundreds of feet in depth; also many of them are open workings, it being only necessary to scratch the ground to obtain the coal."

Reports on Fuel Economy

Dr. W. A. Bone read the report on "Fuel Economy in Steel Works" prepared by himself jointly with Sir Robert Hadfield and A. Hutchinson, and presented on behalf of the British association's fuel economy committee. In the introduction, Dr. Bone said that fuel economy is most necessary at this time and that manufacturers must face very high fuel costs. Moreover, whenever good fuel efficiency is attained, efficiency and economy in other directions follow and vice versa. The speaker deplored the fact that the recently established fuel laboratories are receiving inadequate support and declared the good work may fail unless the government is made aware by the manufacturers of the great importance of this subject.

Cosmo Johns read a paper jointly prepared by himself and L. Ennis on "Fuel Economy in German Iron and Steel Works." A paper was read in abstract by R. J. Sargent, jointly prepared by Sir Robert Hadfield and himself on "Fuel Control in Metallurgical Furnaces."

Benjamin Talbot, opening the discussion said that no doubt more fuel than is necessary is used. Referring to the question of linking up units, he mentioned five plants in Middlesbow so close together that it is quite possible to connect up both as regards gases and a central power station. Mr. Talbot declared that such a combination would take care of the high peaks which often mean big consumption, and stated that the fact the plants are separate entities should not be allowed to prevent the economy secured through co-operative action. He said that in the operation of coke ovens at the blast furnaces the manager should have absolute control of the manufacture of his coke. The coke made at distant ovens often is inferior. To secure the desired economy it will be necessary to return to the cleaning of coal in a fairly satisfactory manner. With regard to the week-ends, gas should be stored so that it can be used in the neighborhood for lighting, heating or for domestic purposes.

F. W. Harbord declared that in many works the cost of necessary modifications to effect a considerable saving would not be prohibitive, though he agreed that in many of the works it would be quite impossible. He stated, however, that there is no reason why every blast furnace should not have a double bell. Something simple and efficient that can be installed at a reasonable cost is desired. Most important savings can be effected by organizing staffs with a view to detecting and preventing leakages. All gases should be analyzed.

Cheap Coal Has Been Factor

Henry Ridge pointed out that economy has not been exercised in the past because coal has been obtained very cheaply. Experiments now in progress may prove that it is possible to use a much cheaper form of apparatus for gas-cleaning. He entirely agreed as to the insufficiency of the data with regard to the use of gas engines for open-hearth practice. A very serious cause of waste arises from the loss of heat units in the slag, which at present cannot be recovered. This is a subject to be dealt with in the future.

Frank Foster insisted that a great saving can be effected by doubling the rate of driving the blast furnace and the steel furnace. The slow rate of driving the blast furnace is largely due to the shape of the furnace which tapers up small in proportion to the bosh. Above all, bet-

ter furnaces are needed because rapid melting cannot be attained without high temperature. Either by increasing the natural suction on the air regenerators or by thinning the air the amount of gas delivered can be greatly increased, and the rate of melting greatly improved. Other countries, especially the United States, are doing better than Great Britain in this respect.

Synthetic Cast Iron

Sir Robert Hadfield presided at Friday's meeting. The first paper read was "Synthetic Cast Iron," by Charles A. Keller, Livet, France, presented in the absence of the author by the secretary.

Dr. Hadfield said he cannot quite see the object of turning steel into cast iron and then turning it back to steel. He declared it must be very wasteful, though no doubt the process proved very valuable during the war Dr. Stead stated that except for cost, the making of synthetic cast iron is a delightful experience, particularly for the chemist. He agreed, however, with Sir Robert Hadfield that the process hardly appeals to the average metallurgist, and unless, like the French company which has cheap and enormous water power for the generation of electricity, giving very low cost of production, manufactures have very cheap power they cannot look to this process as a practical scheme for Great Britain.

J. H. Whiteley read the paper by himself and A. F. Hallmond on "The Action of Iron Oxides upon the Acid Furnace and Structure." Cosmo Johns called attention to the curious fact that a lining is not considered satisfactory until it is soaked with the oxides, yet the oxides are eventually destructve.

Dr. Hadfield did not accept the theory of the surrounding atmosphere. The visible fumes are merely escaping gases. Dr. Benedict declared nitrogen is the protecting agent in fluid steel. A. F. Hallmond, one of the authors, replying said the useful service done by oxides of iron upon the lining is in strengthening the roofs and sides, preventing cracking. He inclined strongly to the view that the roof of the furnace is corroded mainly by iron oxide even in the basic process. The main property to be aimed at in making silica brick for steel works purposes is density. The more silica in the brick the longer time is required to wear it away, and it is a feature of the English brick that it contains a large proportion of unconverted quartz.

Woody Structures of Steel Fractures

The paper by J. J. Whade, Le Creusot, France, on "The Woody Structures of Fractures of Transverse Test-pieces Taken from Certain Special Steels" was read by the secretary. A paper by A. M. Portevin, Paris, on "Notes on Defective Fractures in Tensile Test-pieces During the Inspection of Gun-parts," was discussed simultaneously.

The chairman said there is no question that apart from the composition, the quality of steel to be subjected to transverse tests is largely influenced by the temperature treatment in the furnace and the casting temperature. He has had identical metals behave quite differently as to final physical characteristics. Dr. Giolitti attributed the woody structure to the action in some cases of the surrounding gases in solution, which acquired an oxidizing action on the matter round them. Owing to the shortage of steel it was necessary during the war to make gun forgings from ingot croppings. Chromium was used, but it was difficult to get rid of the woody structure. He believes the nonmetallic inclusions act as germs of crystallization.

High Temperatures Necessary

F. M. Service emphasized the necessity of a very fluid slag during the boiling period, that is high in ferrous oxide. The temperature is highly important. When the metal is run as low as 1420 to 1440 degrees Cent. from the furnace into the ladle there is trouble. Nickel chrome steel has been produced successfully at from 1550 to 1560 degrees Cent. He claimed it is not safe to forge at temperatures as low as 900 degrees Cent. The best remedies for woody structures are high temperatures in the furnace, a proper slag and a high working temperature.

A. H. Dickenson said he considers woody fractures, sliding fractures and all such cases are due to the original structure of the ingot in which there are nonmetallic inclusions. The worst of such inclusions are those which are so small as to be invisible.

Establishing the Value of Patents

BY RALPH H. BUTZ

THE problem of making proper provision for the depreciation in value of patents is one that confronts a large number of manufacturers. This depreciation in value occurs very rapidly in some instances, while in other cases it may take place slowly. In view of these conditions it must be admitted that to estimate the life of a patent at the time of its acquirement is a difficult task. However, it is a problem that should receive the attention of every manufacturer who has no desire to write this asset into his balance sheet at an inflated or fictitious value.

There is no doubt that a patent is an asset so long as it has not become obsolete. In fact it is easier to establish the real value of patents than the theoretical value of good will. A patent may be carried on the books at a valuation far in excess of its actual worth, owing to the fact that no provision has been made to charge depreciation during those years when the depreciation really occurred.

The danger of such a policy is readily realized when it is known that the book value of such a patent must be charged to profit and loss in one amount after its usefulness has been exhausted. It is a far better method to extinguish the book value of a patent in equal annual instalments than to charge the entire amount to profit and loss at one time, thereby reducing the profit for that year to an unusual extent.

While it is true that some patents have considerable value after their legal life has expired, such cases must be considered as exceptional and contingent upon certain circumstances. A great number of patents are of little value after the tenth year, and the manufacturer who refuses to recognize this possibility may not be considered conservative.

As a rule the depreciation of patent values occurs most rapidly during the first few years of its existence, and during which years the greatest profit is derived from its application or use. This fact should be remembered when the schedule of depreciation charges is being constructed. One manufacturer, who is very conservative, maintains a schedule of depreciation charges by which the book value of his patents is extinguished at the end of five years. This schedule

should prove interesting to other manufacturers who are making efforts to arrange their schedule for this purpose on a sound basis, and for this reason the figures are given: First year, 30 per cent; second, 25; third, 20; fourth, 15; fifth, 10.

These percentages apply to the original value, not to the diminishing balance, and by this method the original value is completely extinguished at the close of the fifth year. Of course, this is an ultraconservative policy, for some of the patents may not have depreciated more than 50 per cent during the five-year period. However, the gross profits are of such volume that this expense is absorbed without any undesirable effects.

Three years ago a manufacturer purchased a patent at a cost of $50,000. He estimated the useful life of this patent to cover a period of not more than four years. He finally decided to write down the value of this patent on a royalty basis, and added to the cost of production a nominal amount for each machine. At the end of 18 months the original cost of the patent had been absorbed in the production cost, and without reducing the net profit over that of former periods. This patent has not yet become obsolete, but a sound policy was adopted to which the condition of the business will testify.

Values Should Not be Inflated

What are proper charges to the patents account? The first charge is the purchase price of the patent Unless there are good reasons to the contrary the patents account should not be charged with a greater value than the actual purchase price. That some manufacturers increase the book value of patents over the purchase price was demonstrated quite recently when the assets of a certain concern were examined by an accountant. In this instance it was found that the purchase price of patents on record amounted to $22,000. These patents were carried on the books at a value of $41,000. The annual depreciation charge amounted to 5 per cent of this increased valuation.

The cost of litigation to protect patents is also a proper charge to patents account, although such expenditures are frequently charged to legal expenses, to which there can be no objection. Expenditures for the purpose of procuring assignments and shop rights for the use of patents are also charges to the patent account.

A satisfactory method to allow for depreciation is to build up a reserve for the purpose. In this manner the full purchase price of the patent may be carried on the patent account until its useful life or legal life has expired, and then the entire amount can be charged to the reserve established for this purpose. Such a reserve is established in the same manner as reserves for plant, machinery, etc. In this manner the asset account and the liability account will be reduced in like amount whenever a patent is charged off the books.

Smelting Iron in Sweden 200 Years Ago

BY PETER BONDE

SWEDEN'S history in the art of making iron and steel extends far back in the centuries and is set with interesting and picturesque incidents connected with the efforts of the inhabitants of that rugged land to convert the native mineral supplies into useful articles. How the farmers and other isolated groups on the outskirts of the then trackless country obtained their supplies of iron 200 years ago is a story of hardship and ingenuity.

At that time iron was as scarce as gold. In the few places where the ore lay exposed on the surface of the ground the people had no interest in producing iron except for their own small needs. Under the conditions of life that then prevailed, practically everything for which iron and steel is considered now indispensable, was made of wood, such as plows, harrow-bins, door locks, etc. For certain purposes, however, such as horse shoes, nails, tools, firearms, etc., it was necessary to have iron and steel. The story of how the inhabitants filled that need even in locations where no iron ore could be found, is related in this article.

His supply of iron having begun to run short, the mastersmith of the village in the northern part of one of Sweden's biggest province, Dalecarlia, turned his thoughts to its replenishment. So in the fall days when the frost had made the ground hard and a thin blanket of snow had covered it, he told his neighbors to get ready for a departure into the woods and marshes to make up the year's supply of iron. It was a company of healthy, happy and strong men bowed under heavy burdens that set out to the scene of their labors. Earlier in the fall days the mastersmith with his helpers had made a trip into the woods and marshes and had made the necessary arrangements for the work that was to follow. He had found and chosen places nearby springs and creeks where the water had a rusty color, indicating the presence of iron ore. Then he had shoveled the red earth to higher ground to allow it to become as dry as possible before the ironmaking operations were undertaken. This iron ore socalled, was of the lowest grade, which today is considered practically worthless by scientists and ore experts. The party having set out from the village, traversed a long distance into the woods finally reaching a small log cabin, primitive in style, but well built and comfortable. There the men made their home. Close to the cabin was a creek with a waterfall in which was built a waterwheel. After the

REPRODUCTION OF AN OLD ILLUSTRATION OF A PRIMITIVE SWEDISH BLAST FURNACE

men had become comfortably adjusted in their new quarters—they were in no hurry to get started on their labors—they gradually took up the task before them. Some of them went with skii sleds to transport the ore to a point close by the waterwheel where the blasting oven was located. There the ore was dumped and later shoveled up on shelves which were laid on top of each other on a rack. After the shelves were filled, a big fire was made under the rack and the latter burned in order to eliminate as much dirt as possible from the ore. While this transportation and burning process was in progress, the mastersmith and one helper were busy getting the blasting oven in operating condition. The construction of this oven was done in this way: In the ground close to the waterwheel was dug a round hole from 7 to 8 feet in diameter and about 2 feet deep. In the excavation was built a chimney of rocks about 5 to 6 feet in height with fillings of sand and clay. The latter frequently had to be carried from great distances. The bottom of the blasting oven was concave in form, and was made strong and tight. In the bottom was an opening into which was inserted an air pipe of wood. The outer end of this pipe was divided and each part connected with an airtight wooden cylinder with an open top. In these cylinders air tight pistons were fitted and on the tops of the latter vertical shafts were applied in each of which was inserted a square plug. The shafts were hung on flat, flexible poles of spruce which were fastened to the ground. The waterwheel was constructed with a long axle which ran on a line close to the piston shafts. In the axle were inserted square plugs which, when the axle was revolving, came in contact with the plugs in the piston shaft causing the pistons to be depressed. The air thereby was pressed out of the cylinders and through the pipes into the oven. When the axle plug had turned far enough it slipped out of the plug in the shaft so that the flexible spruce pole lifted the piston. The arrangement was such that when one piston was forced down the other was lifted, thus permitting a constant stream of air to pass through the pipes and into the oven.

Before the waterwheel was put in motion, the men had filled the blasting oven with dry wood and had made a slow fire. The oven then was filled with coal. The waterwheel was started and the ore was shoveled into the oven. The blast was increased from time to time as the process advanced. Afterward the mastersmith with a rod stirred deeply the contents of the oven to ascertain the progress of the smelting. When he determined that the operation had reached the right stage, the blast was turned off and the red hot mass was allowed to cool off somewhat. There remained a lump of iron in the bottom of the oven which was taken out while hot, placed on a flat stone and hammered with a big sledge. It was then cut to pieces with a cold chisel. The iron then was put in some haystack in an adjoining meadow, which had been harvested in the summer. There it was left until sufficient snow had made it possible for horses and sleds to reach the spot and convey the metal to the village. At the blacksmith's shop the iron pieces were reheated and forged into the various products under the hammer. The quality of the iron thus obtained in this crude fashion it is declared has remained unsurpassed to the present day.

When the supply of the socalled "iron dirt" was exhausted in one place, the mastersmith looked up another location. Today in Sweden may be seen the ruins of many of these primitive smelters. Each fall the operation of iron-making in the forest was repeated. When the men returned to their village after their expeditions for iron they brought with them also heavy burdens of fish and fowl which they had hunted during their stay in the marshes and woods.

Strikes Hamper Output of German Works

As the result of strikes and large increases in wages German manufacturers, especially those in the Dusseldorf district, have almost exhausted their reserves, according to an open letter received by the bureau of foreign and domestic commerce from the employers' association of the Dusseldorf district. The letter states that strikes have been increasing, despite large increases in wages, and customers hesitate to place orders on account of the uncertainties in the political and industrial situation. Part of the letter follows:

"In October of 1918 the production of five blast furnaces in this district amounted to 116,281 metric tons of pig iron; in March, 1919, it was 63,000 tons and in April was further reduced to 54,635 tons. A number of steel works producing 105,611 metric tons of steel per month in 1918, had an output of only 68,000 tons in March, 1919, and in April, 1919, production had decreased to 33,797 tons, less than one-third of the output for 1918. In a majority of the works production has been reduced to less than 50 per cent of the output recorded in the months preceding the revolution."

Finances have been heavily hit by the abnormal demands for increased wages. To quote examples from the letter: "In five months after the revolution one firm paid out in salaries and wages about 1,900,000 marks and sold goods for 1,500,000 marks. Another firm produced goods valued at 4,600,000 marks in 1918, employing 900 workers, of whom about 100 were prisoners of war, 200 to 300 reclaimed soldiers and the remainder women and youths. During the same period in 1919 the firm employed 1200 able-bodied workmen and produced goods of a value of 2,500,000 marks."

The letter further states that as a result of the steady losses a number of employers are seriously thinking of closing their factories, and reports from the industrial districts, show that labor is bringing about its own ruin, as many employers are discharging their men. To quote further from the letter:

"A sharp light is thrown on this frightful situation by the recent declaration of the board of directors of the Krupp Co., before the workers in mill at Essen. The mill cannot fully employ its workers in the finishing departments as there is a shortage of raw materials and semimanufactured articles, due to the reduced production of the furnaces and foundries. The firm informed the workers it will endeavor to protect them as far as possible against the consequences of reduced production. In case the conditions do not improve within a reasonable time, the company will continue to pay its unemployed workers 70 per cent of their wages for a definite time and later refer them to the unemployment insurance fund of the state, while those doing the work of the helpers will, after a like period, receive only helpers' wages."

Time for Filing Patents is Extended

The industrial property section of the peace treaty, as it appears in the *Congressional Record,* provides for an extension of the time for filing applications for foreign patents and for reviving foreign applications or patents which have lapsed during the war in the contracting countries, according to a statement by Clarence J. Loftus, Chicago, counsellor in patent and trade-mark causes. He says this section in substance also provides:

1. That any time within six months from the coming into force of the treaty, convention applications may be filed in convention countries based upon applications filed subsequent to July 31, 1913. Heretofore, it has been

necessary to file such applications within 12 months from date of filing application in the home country.

2. That the necessary steps for the prosecution of pending applications can be taken within one year from the coming into force of the treaty.

3. That taxes not paid during the war may be paid now or at any time within one year from the coming into force of the treaty.

4. That the failure to work patents in such countries as the law requires working will not forfeit the patent or constitute a ground of revocation of the patent for a period of one year from the coming into force of the treaty.

5. That as to patents in force on Aug. 1, 1914, no working is required for a period of two years from the coming into force of the treaty.

6. That no action can be maintained by German nationals based on the manufacture, sale or use of industrial property rights during the war where such manufacture, sale or use was made by the government of the allied or associated powers or by anyone acting on behalf or with the assent of such government.

7. That assignments made during the war which might defeat the objects of the present treaty may be considered void by the allied or associated powers.

Develops Plant for Heavy Forgings

GRADUAL development, culminating in recent improvements in the heat treating department, has given the Allis Chalmers Mfg. Co., Milwaukee, an unusually well equipped plant for producing, heat treating and machining large forgings. The initial steps toward establishing a forge department were taken 12 years ago, when in developing large units for steam, electric and hydraulic plants, the company was face to face with the necessity of either going to the large forging plants in the eastern part of the United States for the large forgings required, necessitating delay and inconvenience as well as interferring very materially with deliveries; or putting in a forge plant large enough to take care of this heavy work. The management decided upon the latter course, planning and designing a shop to take care of future expansion by installing a 3000-ton hydraulic press of the steam intensifier type. Later a 1000-ton press, which is shown in Fig. 1, and a series of various sized hammers were added. This equipment provided more capacity than was required for the company's needs, and therefore the extra product, either rough forged, rough machined or finish machined, was offered.

In order to keep pace with the growth of the forging department, it was necessary to provide additional facilities for heat-treating. Improvements and extensions covering a period of several years have given the heat-treating department ample equipment to handle all products of the forge shop. At the present time, the heat-treating shop contains 10 horizontal and two vertical furnaces for large forgings and various other units for small work.

Among the horizontal heat-treating furnaces are three car type box furnaces, 8 x 12 x 16 feet; two car type furnaces, 6 x 8 x 30 feet; two car type

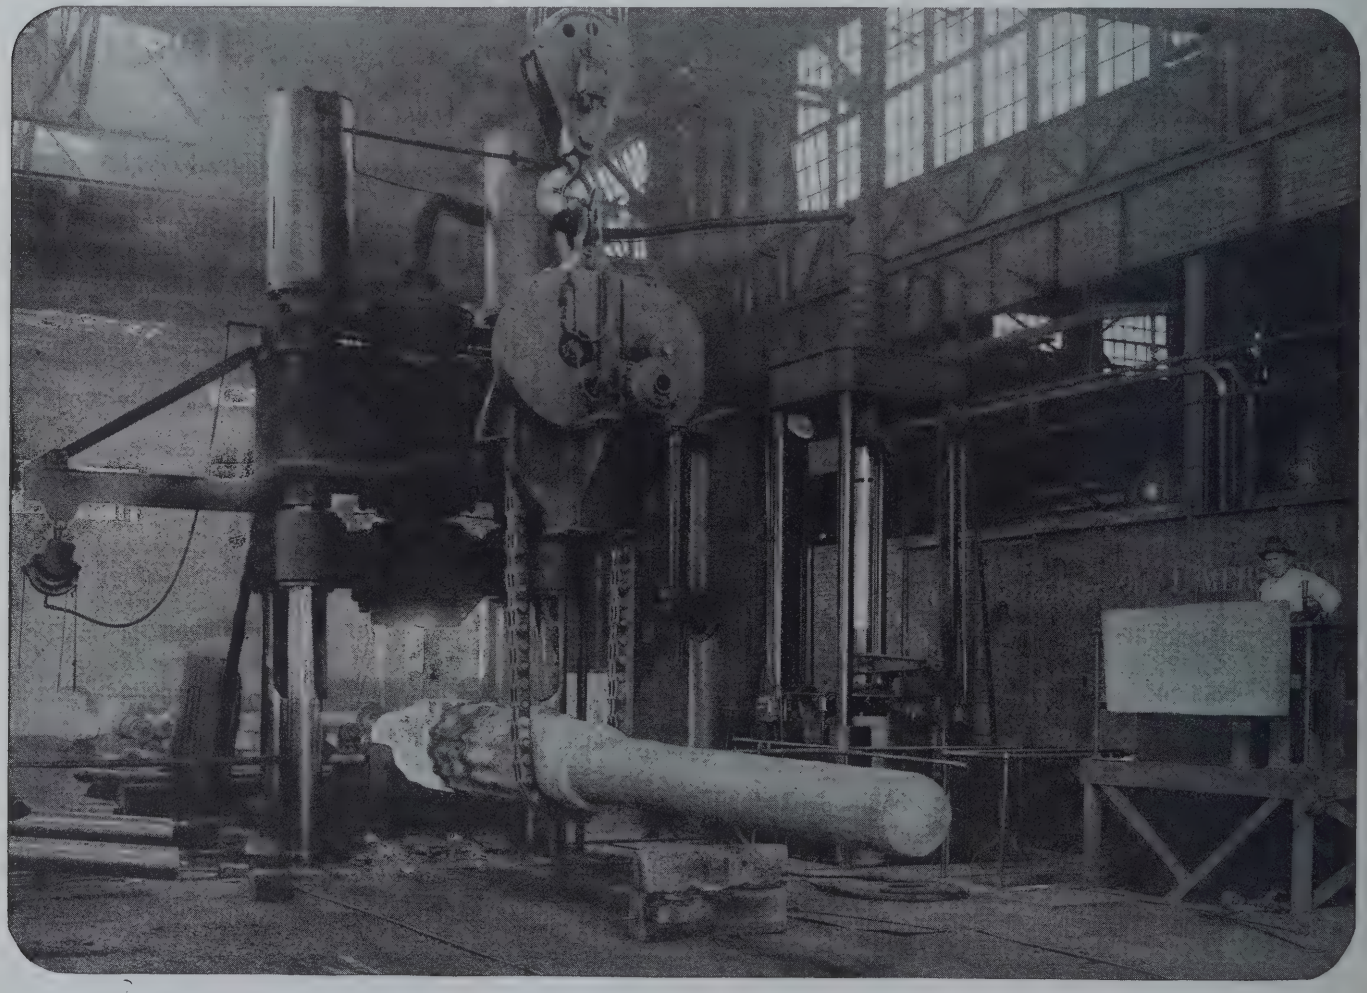

FIG. 1—ONE OF THE SMALL HYDRAULIC FORGE PRESSES. THE LARGEST MACHINE IN THE FORGE DEPARTMENT IS A 3000-TON PRESS

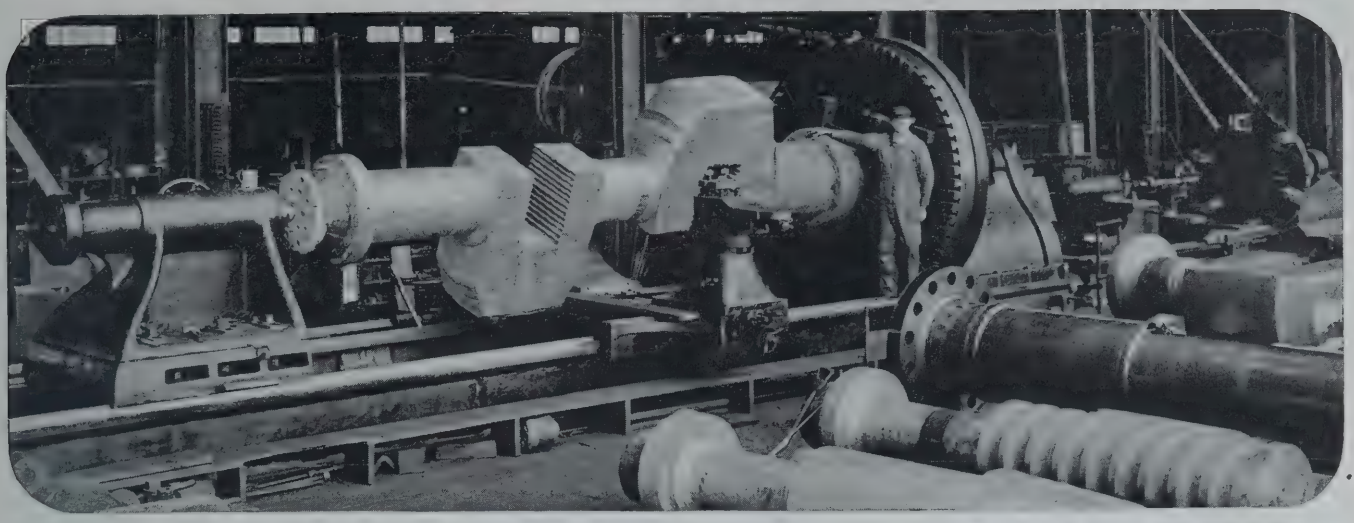

FIG. 2—TURNING A TWO-THROW CRANKSHAFT IN MACHINE SHOP WHICH SERVES FORGE SHOP

furnaces, 6 x 8 x 45 feet; one car type furnace, 6 x 8 x 50 feet; one open top furnace, 5 x 7 x 16 feet, and one open top furnace, 6 x 8 x 50 feet. All of the horizontal furnaces are oil fired and of the semimuffle type. For heat treating hollow shafts and similar forgings two large vertical furnaces are provided. The largest, which is 70 feet high and 14 feet in diameter, accommodates shafts 60 feet long. The other furnace is 50 feet high and 14 feet in diameter. Both are of the semimuffle type and are oil fired. They are equipped with recording pyrometers arranged so that temperature readings may be obtained at intervals of a few feet over the entire length of each forging. The indicators for the pyrometers of all furnaces are installed in a central station where the temperature readings are under the observation of metallurgists.

The equipment of the heat-treating department also includes a number of horizontal and vertical quenching tanks in which large forgings can be handled. The largest vertical tank, 14 feet in diameter and 75 feet deep, is shown in the foreground at the left of Fig. 3, which is a view of the heat-treating department.

The machine shop is equipped to rough-turn and finish forgings ranging up to 60 feet in length. Special machines for hollow boring marine shafts and similar forgings are installed. The entire plant, comprising the forging, heat-treating and machine shop departments, now is capable of handling the largest product of the largest forging press, which is equivalent to a 40-ton forging worked down from an ingot weighing from 55 to 60 tons. Within this weight, the plant can forge, heat treat and machine shafts up to 48 inches in diameter and up to 60 feet long.

During the war the company, because of its facilities for making large forgings, engaged in ordnance and marine work for the government, producing guns; tubes; torpedo cylinders; recoil cylinders and pistons for large navy guns; shafting for battleships, cruisers and destroyers; and shafting connecting rods, rudder stocks, etc., for the Emergency Fleet corporation.

Arsenal Tests Increase

Tests of iron and steel and other materials at the Watertown, Mass., arsenal during the fiscal year ending June 30, 1919, included 43,964 specimens, exclusive of those carried out during the course of experiments and not finally reported with the experiments. The number of specimens tested for the ordnance department was 43,536, while the number tested for private parties was 428. This shows an increase of 258.9 per cent over the figures of last year, the number of tests made during the year ending June 30, 1918, being 12,248. These facts are contained in the report of Lieut. Col. T. C. Dickson, commandant at the Watertown arsenal, which recently was submitted by Brig. Gen. C. C. Williams, chief of ordnance, to the secretary of war.

Luxemburg Industry Far Behind

Only 16 of 47 Blast Furnaces in Operation, With Output 26.4 Per Cent of Pre-War Figure—Steel Production But 21.2 Per Cent of Normal—Big Plants Owned by Germans Still Idle

OFFICIAL statistics received recently in this country give the present rate of operations of blast furnaces, steel plants, mills and foundries in Luxemburg and afford a basis for some interesting comparisons with normal production in that territory.

At present 16 furnaces with a capacity of 2870 tons are in operation, while 31 with a capacity of 5425 tons are out of commission. The normal production of pig iron before the war was 236,000 tons monthly, or, at that rate, 2,832,000 annually. At present the monthly production is but 62,500, or but 26.4 per cent of the prewar output. If the present rate of output is continued for a year the total would be 750,000.

Present production of steel is 21.2 per cent of the normal output before the war. The normal monthly output was 157,000 tons, or 1,884,000 annually. The present output is 33,400 monthly.

Semifinished 19.85 *Per Cent*

The output of semifinished steel is 19.85 per cent of the prewar figure. Normal monthly production was 131,000; yearly, 1,572,000, while today the monthly production is 26,000. Iron, steel and bronze foundries produced 3480 tons of castings monthly before the war; at present the production is but 660 tons.

The average of these statistics shows that the iron and steel industry of Luxemburg is operating at but 22 per cent of its prewar capacity.

In 1918, four of the large companies operating in Luxemburg produced 908,314 tons of iron; 594,418 tons of ingots and castings; 330,144 of finished material and 189,863 tons of semi-finished. Three of these companies were distinctly German concerns, while one included French and Belgian capital. The record of production in 1918 does not include the output, if there was any, of one large plant owned by a Belgian company, manufacturing iron and steel. All of these companies, and another, operating only a foundry, are now in some degree productive. They represent the iron and steel industry of Luxemburg, and their present production, compared with their prewar output, in detail follows.

Iron and Steel Production in Luxemburg

SOCIETE DES ACIERIES REUNIS DE BURBACH-EIGH-DUDELANGE (ARBED)

A Luxemburg company with French, Belgian and Luxemburg capital. It possesses three separate companies.

I. The Usine d'Esch-sur-Alzette

2200 Workmen

Blast furnaces: Two of 110 tons capacity, one of which is lighted; one of 160 tons, not lighted; three of 225 tons, of which two are lighted.

	Tons
Monthly normal production	30,000
Actual	15,000

Thomas converters: Four, each of 23 tons capacity.

Normal monthly production	25,000
Actual	12,000

One blooming mill; five rolling mills and one wire mill.

Monthly normal production	20,000
Actual	10,000

II. Usine de Dudelange

1800 Workmen

Blast furnaces: Four of 130 tons, of which two are lighted; two of 150 tons, of which one is lighted.

Monthly normal production	25,000
Actual	12,000

Thomas converters, four of 23 tons.

Normal monthly production	20,000
Actual	11,000

Martin furnaces, two of 25 tons.

Normal monthly production	3000
Actual	none

One blooming mill and five rolling mills.

	Tons
Normal monthly production	18,000
Actual	8000

Foundry.

Normal monthly production	980
Actual	190

DEUTSCH-LUXEMBURGISCHE BERGWERKE UND HUTTEN AKTIEN GESELSCHAFT

A German capitalized company, with two distinct plants.

I. Usine de Differdange

4900 Workmen

Blast furnaces: Ten of 190 tons, of which two are lighted, eight extinct, one unusable and two undergoing repairs.

Normal monthly production	55,000
Actual	9000

Thomas converters: Five of 25 tons.

Normal monthly production	50,000
Actual	none

One blooming mill, six rolling mills, one wire mill.

Normal monthly production	45,000
Actual	none

II. Usine de Rumelange

Blast furnaces: Three of 110 tons, all extinct.

Normal production per month	9000
Actual	none

SOCIETE DE OUGREE-MARIHAYE

The Luxemburg organization of an important Belgian company.

I. Usine de Rodange

1000 Workmen

Blast furnaces: Five of 150 tons, of which three are

lighted, one extinct and one in construction.

	Tons
Normal monthly production	22,000
Actual	13,000

Thomas converters of 12 tons.

Normal monthly production	20,000
Actual	9000

One blooming mill, two rolling mills.

Normal monthly production	18,000
Actual	8000

Foundry (Iron).

Normal monthly production	1250
Actual	none

Structural steel plant.

Normal monthly production	250

III. Usine de Dommeldange & Eich

1200 Workmen

Blast furnaces: Three of 110 tons, of which one is lighted.

Normal monthly production	9000
Actual	2500

Martin plant with two Wellman furnaces, one of 20 tons and one of 30 tons.

Normal monthly production	1000
Actual	800

Electric furnaces for refining of Martin product: Three of the Roechling system of 3.5 tons.

Normal monthly production	700
Actual	600

Foundry (Iron).

Normal monthly production	110
Actual	80

Foundry (Steel).

Normal monthly production	540
Actual	250

Foundry (Bronze).

Normal monthly production	50
Actual	10

Structural steel plant.

Normal monthly production	400

GELSENKIRCHENER BERGWERKS UND HUTTEN AKTIEN GESSELSCHAFT

A company of German capital, possessing two plants.

I. Usine d'Esch-sur-Alzette

900 Workmen

Blast furnaces: Five of 280 tons, three of which are lighted.

Normal monthly production	40,000
Actual	8000

II. Usine Adolph-Emil-Hutte at Belval

2000 Workmen

Blast furnaces: Six of 250 tons, none of which is lighted.

Normal monthly production	40,000
Actual	none

Thomas converters: Five of 23 tons.

Normal monthly production	35,000
Actual	none

Two blooming mills, three rolling mills, one wire mill.

Normal monthly production	30,000
Actual	none

SOCIETE DES ACIERIES DE STEINFORT

A Luxemburg company with German capital.

FRENCH ENGINEER'S MAP, SHOWING LUXEMBURG IN RELATION TO IRON AND STEEL INDUSTRIES OF LIEGE, LONGWY, THIONVILLE AND BRIEY

Usine de Steinfort

500 Workmen

Blast furnaces: Two of 45 tons, both extinct; one of 120 tons, in operation.

	Tons
Normal monthly production	6000
Actual	3000

Martin furnace of 18 tons.

Normal monthly production	2000
Actual	none

Electric steel plant: One furnace of 3.5 tons.

Normal monthly production	300
Actual	none

UNION DES ACIERIES (SOCIETE ANONYME)

A Belgian company.

Usine at Luxemburg Gare

450 Workmen

Foundry (Iron).

Normal monthly production	100
Actual	30

Foundry (Steel).

Normal monthly production	450
Actual	100

Refining Basic Electric Steel

Officials of a Western Steel Company Organize Interplant Association for the Purpose of Promoting Co-operation and Thereby Stimulating Production—Questionnaire Brings Out Interesting Details of Manufacture

BY W. H. PAYNE

IF ELECTRIC furnace steel is to be made on a competing price basis with the open-hearth product, it is essential that all short cuts and time saving methods be adopted in its manufacture. The demand for electric-alloy steel used for gun and ship forgings increased much faster in proportion to the experience necessary to thoroughly control the product.

To electric steel manufacturers this meant: *First,* that in order to maintain the market for electric forging steel, it would be necessary to pay attention to every detail in its manufacture. *Second,* that one way of doing this was to teach furnace operators as far as practical the chemistry of furnace refining processes. *Third,* that bonus systems be inaugurated for operation covering the lowest limit of electrical consumption per ton of steel produced, which necessarily would be tempered by the amount of refining and grade of the product; percentage of losses from off heats caused by irregular operations; and, tonnage over a definite period of time.

With the foregoing in mind the officials of the General Steel Co., St. Francis, Wis., organized an interplant association which includes the electric furnace superintendent, the furnace melters, the metallurgist, the chief chemist and the works engineer.

The object of the organization is to promote co-operation among the melters and thereby increase furnace production and efficiency.

Answers to a questionnaire which was presented at a recent meeting of this organization are as follows:

Oxidizing Period

In what kind of furnace lining may phosphorus be removed?

In the process of refining steel phosphorus can be removed commercially in a furnace which has a lining composed of a basic refractory, the best example being dead-burned magnesite, in the brick form for the bottom layers and side walls above the slag line, and in a loose crushed form to "sinter in" by layers when forming the working bottom. Since, in the process of removing sulphur and phosphorus from steel, it is necessary to use lime slag, which is a basic material, it is necessary to hold this bath of steel and the slag in a basic lining to prevent chemical reactions which will destroy the bottom.

Give an example of an average mixture of a basic oxidizing slag, in a 12-ton electric furnace, for a 0.60 per cent carbon, a 0.07 per cent phosphorus and a 0.06 per cent sulphur meltdown and how fast is it best to put it in?

This is a high meltdown. It would be advisable to form a basic-oxidizing slag of about 500 pounds of lime and 350 pounds of iron ore. This is to be mixed in as about one-third of the cold charge has been thrown in. It is imperative that the iron ore be kept from the furnace lining, as not only the chemical reactions of the oxides in the ore will soften the bottom and cause it to come up, but the mechanical action by the boiling of the steel as the ore breaks up, will make the first condition worse. After the furnace has melted down and the banks "pulled," it is good practice to throw a few shovels of lime around the banks to protect the walls from the cutting action of the iron ore. Additional lime and ore may be added according to the discretion of the melter in charge. A high carbon meltdown will hold a heavy slag. About 50 or 60 pounds of mill scale will cut or thin a hot heavy slag.

In what form is phosphorus in the molten steel before it combines to form an oxide in the process of being removed?

Phosphorus is found in the molten steel as a solution with iron known as phosphide of iron, Fe_3P.

In what stable form is phosphorus in the slag?

Phosphorus is found in the slag, as basic calcium phosphate, $Ca_3(PO_4)_2$ which is a stable constituent under normal furnace conditions.

In what form is carbon in the molten steel, and is it necessary to remove carbon to as low as 0.15 or 0.20 per cent before the phosphorus may be oxidized?

Carbon is found in plain steel as a carbide of iron Fe_3C. Under average conditions it is generally conceded that it is necessary to remove carbon to as low as 0.15 or 0.20 per cent before phosphorus may be oxidized to any extent.

In the meltdown as previously mentioned where you are making a medium carbon steel, say 0.40 to 0.50 per cent, can phosphorus be oxidized down to 0.02 per cent without removing carbon, by working the furnace at the proper temperature?

It is a well established fact that oxygen has a stronger attraction for carbon as the temperature of the furnace is increased. In working down the heat therefore, it would be best to work the furnace as hot as possible, taking into consideration other factors, until carbon is worked out to about 0.35 per cent, and then work the furnace colder as this gives best conditions to begin the removal of phosphorus. On the contrary, if you are making a low carbon steel of about 0.10 or 0.15 per cent it would be best to work the oxidizing period hot all the way through.

Can you therefore remove phosphorus fastest at a low furnace temperature?

Yes, when the carbon is fairly low (about 0.35 per cent), because the lower temperature, swings the advantage over to the removal of phosphorus as it lessens the attraction of oxygen for carbon.

In how many chemical reactions is phosphorus removed from steel and what are the chemical equations?

Phosphorus is removed by oxidizing reactions according to the following equations. If limestone is used, it is first necessary to break it up into lime and CO_2 gas as follows:

Limestone — Lime + A Gas

1. $CaCO_3 + \text{heat} = CaO + CO_2$

Iron Phosphide + Iron Oxide = Phos. Pent oxide + Iron

2. $6\,Fe_3P + 5\,Fe_2O_3 = 3\,P_2O_5 + 28\,Fe$

Phos. Pent oxide + Lime = Basic Calcium Phosphate

3. $3\,P_2O_5 + 9\,CaO = [3\,Ca_3(PO_4)_2]$

The author, W. H. Payne, is chief engineer for the General Steel Co., St. Francis, Wis.

Equation No. 1 shows that, limestone plus heat will break up into lime plus carbon dioxide.

Equation No. 2 shows that when iron ore or mill scale is brought into contact with the phosphorus in the steel (other conditions being correct) that phosphorus pent oxide is formed and free iron, which goes back into the metallic bath, while the lighter phosphorus oxide comes up in the slag.

Equation No. 3 shows that phosphorus pent oxide on coming up in the slag and in contact with lime, forms a stable compound, calcium phosphate. This compound will remain in the slag and is raked off, other conditions being correct.

It is probable that some of the last phosphorus to be oxidized does not go through the latter equation, but is removed as an oxide when the slag is pulled.

Why is iron ore added to a high-carbon meltdown in preference to mill scale, as an oxidizer?

Iron ore is used because of its high specific gravity which means that it will work through the molten bath instead of floating on the slag as light mill scale will do.

If you expect a high-carbon and phosphorus meltdown is it a good policy to add mill scale with the charge?

Since the objection to the use of mill scale is because of its light weight, it is best to mix with the furnace charge, as near as possible, the correct amount of mill scale to remove the carbon and phosphorus present. The addition of mill scale with the charge insures that the oxides will be mixed thoroughly and that oxidization will begin as early as is possible with each heat.

Why does iron ore cut a basic-furnace lining?

The acid silicon in the iron ore combines with the basic refractories and because the fusion point of the combination, is lowered, the bottom may "come up." This condition is made worse since the mechanical action of the oxides cause a violent agitation of steel adjacent to the fused lining, helping to work it up.

Reducing Period

In what kind of furnace lining only may sulphur be commercially removed?

Because of the reducing conditions (that is, entire absence of oxygen) necessary for the removal of sulphur the basic electric furnace is adapted to lowering the sulphur content, in the process of refining steel.

Give an example of a basic reducing slag in a 12-ton electric furnace for an 0.06 per cent sulphur removal?

With this meltdown, it will be advisable to form a reducing slag of about 250 to 300 pounds of lime, 90 to 100 pounds of finely ground petroleum coke, and 75 pounds of fluorspar. This should be mixed before thrown in on the bare steel, from which the oxidizing slag has just been pulled or raked off as clean as possible.

How fast is it added to the molten steel?

The reducing slag should be thrown in quickly, being careful not to cool the furnace too much. It is highly important that the slag be scattered all over the bath. To insure a flexible temperature control, the operating board should be provided with series rheostats in the automatic control circuits, thus giving the furnace melter any amount of current at two different voltages, which he may desire. When the cold reducing slag is thrown on, the furnace may be run on "high" for a sufficient time to thoroughly heat up the bath and mix the slag by causing violent agitation of the steel.

Why is powdered petroleum coke used on the slag?

Petroleum coke is preferred over other forms of carbon, because of its low specific gravity, which means that it will float on the slag and not go into the steel and increase the carbon content. Carbon is necessary in the reducing slag for two reasons: First, to absorb all remaining oxygen and remove it in the form of gas. Second, for the formation of calcium carbide.

Why is it first necessary to get all of the remaining oxygen out of the steel and slag before the sulphur may be taken up?

Since sulphur is removed finally as calcium sulphide, CaS, and because oxygen has a stronger attraction for calcium than sulphur, any amount of oxygen will react to render passive a corresponding proportion of calcium in the slag.

In what form is sulphur in the molten steel?

Sulphur is in the molten steel as iron sulphide, FeS, and manganese sulphide, MnS.

In what stable form is sulphur held in the hot slag?

Sulphur is held in the hot slag as calcium sulphide, CaS.

In how many different chemical reactions is sulphur removed from the hot steel, and what are the chemical equations?

Sulphur is removed from the hot steel according to the following equations. If limestone is used, it is necessary to first break it up.

	Limestone		Lime			Carbon dioxide
1.	$CaCO_3$	+ heat =	CaO	+		CO_2

	Iron Sulphide		Lime	Carbon		Calcium Sulphide	Carbon monoxide
2.	FeS	+	CaO	+ C	=	CaS	+ Fe + CO

	Lime		Carbon		Calcium carbide	Carbon monoxide
3.	CaO	+	$3C$	=	CaC_2	+ CO

	Lime	Calcium carbide	Iron sulphide			
4.	$2\,CaO_2$	+ CaC_2	+ $3\,FeS$	=		
					Calcium sulphide	Iron	Carbon dioxide
					$3\,CaS$	+ $3\,Fe$	+ $2\,CO_2$

Equation No. 1 shows that limestone plus heat will break up into lime and carbon dioxide.

Equation No. 2 which takes place at moderate furnace temperature, before calcium carbide is formed, shows that iron sulphide, in the presence of lime, will make stable calcium sulphide, iron and carbon monoxide gas.

Equation No. 3 shows the formation of calcium carbide as the slag works into condition, and that lime, when in the presence of carbon (from petroleum coke), forms calcium carbide and the gas.

Equation No. 4, which takes place at the high temperatures, when calcium carbide has been formed, shows that iron sulphide (which being lighter than pure iron comes up to the slag) in the presence of calcium carbide, with an excess of lime, is robbed of its sulphur to form stable calcium sulphide, and the gas, leaving free iron, which being heavier goes back into the bath.

It will be noticed that equations Nos. 2 and 3, evolve a carbon monoxide gas, which on escaping from the openings around the electrodes, burns to carbon dioxide, with a characteristic flame. This gas, by surrounding the electrodes, and having an affinity for oxygen, aids in protecting the carbons from oxidizing or eating away. It is generally conceded that a small proportion of sulphur is removed during the oxidiza-

Invent Novel Tin Plate Machine

Four Plates Handled Simultaneously in Unusual Type of Machine in Welsh Mill Which Automatically Feeds, Pickles, Tins and Cleans Plates at Rate of 125 Boxes in 24 Hours

PRACTICALLY all of the steel plates tinned in the United States are fed into the tinning pots singly by hand. The tinned plates leave the palm-oil bath automatically and drop onto a conveyor which operates at right angles to the tin pot. By means of this conveyor the plates are fed into the branning machine.

A novel departure from this type of tinning machine recently was made by Spence Thomas, manager director, and W. R. Davies, general works manager of the Melingriffith Tin Plate Works, Whitchurch, near Cardiff, South Wales. The machine, shown in Fig. 1, which was invented by these men, automatically feeds, pickles, tins and polishes four plates at once, the plates traveling straight forward throughout the process. Each machine is driven by a 20-horsepower motor, occupies 20 x 30 feet of floor space and has a normal capacity of approximately 125 boxes of tin plate per 24 hours.

After the plates are annealed, following the cold-rolling process, they are piled on the four charging tables built side by side at one end of the machine. Serving each table is a cone-shaped, rubber sucker, which is kept moist by sprays of water. The suckers are mounted on rocker arms which operate simultaneously from the common shaft, *A*, shown in Fig. 2. This shaft is operated by gears keyed onto the left end. When the four rocker shafts bring the suckers in contact with the plates, the top plate from each pile is transferred to the receiving tables, *B*. These are so built that the sucker arms pass between, releasing the plates upon the tables. The sucker arms then return to their original position.

How the Plates Are Fed

When the receiving tables are tilted the four plates drop, side by side, into the pickling baths, *C*, where any oxidation which may have occurred during the annealing process is removed. By means of lugs extending from the rim of the wheels, *D*, the plates are pushed between the first pair of a series of rolls, which, by the aid of stationary guides, direct the plates into the fluxing pans, *E*. While the plates are in transit from the pickling to the fluxing baths they are drenched with water, the latter draining underneath the rolls into the trough, *F*. The pair of rolls built just over the charging end of the fluxing pot, operate at an increased speed and force the plates through the fluxing solution quickly. It has been found that by speedily passing the plates through the fluxing bath considerable economy in the consumption of tin is effected, inasmuch as the plates do not become dry or unduly heated.

The rocker arms, *G*, mounted on the shaft, *H*, push the plates into a pair of rolls which forwards them into the tin pots, *I*. By means of similar rolls and guides arranged in series, the plates are directed up through a solution of palm oil. Upon issuing from this bath they are caught between two rolls which squeeze off the excess tin. They are then directed into a double-type branning machine where revolving arms assist in thoroughly cleaning and removing the palm oil from the top surfaces. As the plates issue from the primary branning machines, they pass upward between guides until the lower edges are positioned just over the entrance to the secondary branning machines. A trip motion causes the plates to fall into the secondary cleaning apparatus with the reverse sides in position for branning. After this operation is completed the cleaned plates pass between four sets of dusting rolls, *K*, and drop onto an endless conveyor, *L*. This delivers them to a final series of burnish-

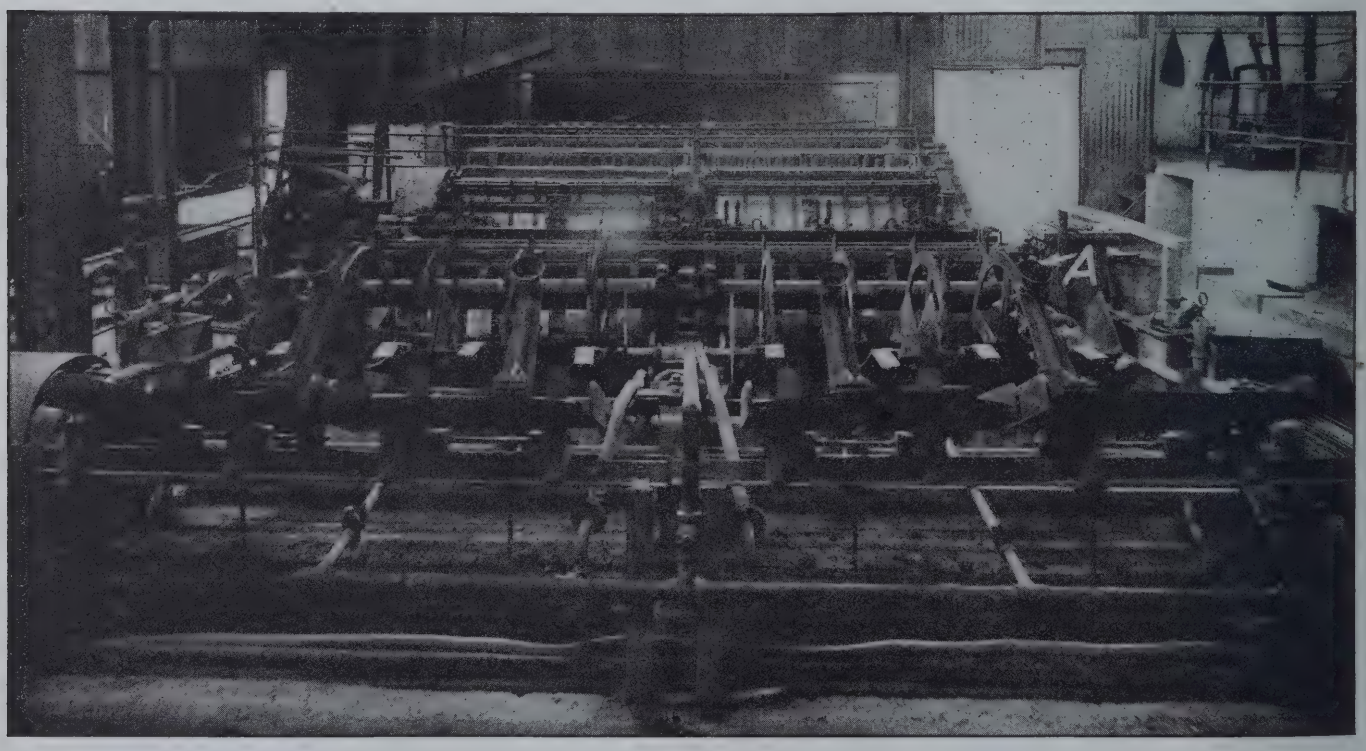

FIG. 1—AUTOMATIC FEEDING, PICKLING, TINNING AND POLISHING MACHINE WHICH HANDLES FOUR PLATES AT THE SAME TIME

ing rolls. The latter operate at right angles to the first set of rolls and impart a high polish to the surface of the product. The tinplate is then conveyed to the boxing department.

Refining Steel

(*Concluded from page* 1053)

tion period of the electric process also, according to this equation.

Iron Sulphide	Oxygen		Iron	Sulphur dioxide
FeS	$+ O_2$	$=$	Fe	$+ SO_2$

This equation shows that iron sulphide plus an excess of oxygen in the oxidization of carbon, and phosphorus forms sulphur dioxide (which leaves furnace as a gas) and free iron which goes back to the hot steel bath.

Under what furnace conditions do the foregoing reactions take place fastest?

The reactions for the removal of sulphur from steel take place fastest when the furnace is working hot.

Why is fluorspar used on reducing slags? Explain its reactions. Why may you get too much spar, and how may you counteract its effect?

Fluorspar is added to a viscous slag to make it thin, and therefore in a condition which will prevent the greatest chemical activity. A "heavy" slag will not cover the steel completely, but will form in little piles, leaving pure steel in places. The thinning of a slag by fluorspar is a physical action, in which the spar acts as a flux. Calcium fluoride melts at 902 degrees Cent. which is several hundred degrees below the formation temperatures of the ferrous-calcium compounds, of which the slag is largely composed. As the fluorspar melts, it dissolves the other constituents of the slag, and for this reason is generally called a flux. The addition of a little lime or powdered petroleum coke will counteract any ordinary excesses of spar.

Why do we use limestone instead of slacked lime, what is the effect of lime dust on silica roof brick, and is this deteriorating effect on the roof of sufficient consequence to warrant the use of limestone which requires heat to break up?

Limestone ($CaCO_3$) is used instead of lime (CaO) because it costs a great deal less than lime, it is much easier to handle, the percentage of loss in handling is much less, handling is much easier on men because of entire absence of dust, and limestone brings about a better mixing of the slag as it boils in breaking up. Lime, however, does not require heat to break it up, therefore it acts faster on a slag. Whether or not the fluxing effect of lime dust on the acid silica roof and upper wall brick, is of sufficient consequence to prohibit its use, should be determined by a thorough trial over a period of time.

What is the color of the best carbide slag?

The best carbide slag is a grayish-white fluid slag, which when sampled, by allowing some to stick to a hot test bar, and plunging into cold water for an instant, and removing, will crumble, and give off acetylene gas with the characteristic odor, indicating the presence of calcium carbide, CaC_2. The slag which has the largest proportion of calcium carbide in it, indicates a slag which has the highest affinity for sulphur.

Why may a reducing slag go back, and what may be added to make it "come" again?

A carbide slag may be black if too much carbon is added, or may change to a black oxidizing slag if enough is not present to remove all oxides. A little fine ferrosilicon will "bring" it again if it is a black oxidizing slag, but should be used as little as possible for two reasons: First, on account of the cost. Second, an excess will go into the bath, but this is not likely to occur if it is broken up fine. Powdered petroleum coke will act to help "bring" a carbide slag which is black and glassy.

Is the fact that a strong sulphur smell is sometimes noticeable, when pouring a heat of electric furnace steel into a ladle, due to the oxygen in the air combining with the sulphur in the slag when it is exposed, or is the sulphur smell due to further oxidization of what is left in the steel?

This smell is undoubtedly due to sulphur from the slag, as the slag contains a much larger per cent of sulphur than the refined steel.

What will happen to the furnace bottom and banks which has been patched with dolomite, if the reducing slag is not kept basic with lime?

If a reducing slag is not kept basic with lime, the slag will rob the dolomite which has been thrown around the banks, of some of its limestone, and thus cut the banks.

How does an occasional roof brick dropping into a reducing slag effect it?

Since a silica brick promotes acid reactions it will be necessary to add plenty of coke and lime to counteract and hold the slag basic. The lime acts by converting the brick into a silicate, and the carbon of coke, by forming silicon carbide.

Why may ground electrodes be used to a better advantage for recarborizing than other forms of carbon as petroleum coke or retort carbon, etc.?

Ground carbon electrodes having a greater density than other forms or ordinary carbon mentioned, of the

same mesh; and having all of the volatile matter distilled out during the process of graphitizing when manufacturing; require a high temperature for volatilizing. These two points permit the electrode carbonizer to work down into the bath to a greater extent.

Crane Doors Opened by Compressed Air

In order to move a traveling crane in and out of the erection shops, the Heine Safety Boiler Co., St. Louis, recently installed a number of large doors of unusual design. The wide upper door shown in the accompanying illustration has seven windows and weighs 9000 pounds. It is lifted by compressed air. Half of the weight

END OF THE BOILER ERECTING BUILDING THROUGH WHICH THE TRAVELING CRANE MOVES WHEN TRANSFERRING MATERIAL TO OR FROM THE YARD

of this door is counterbalanced, making the net lifting weight for the air approximately 4500 pounds. To permit the crane to pass through the doorway, this door, which is 64 feet wide, must be lifted 9 feet.

Two small swinging doors through which the cage for the craneman passes are visible in the accompanying illustration beneath the left-hand girder. These doors swing open simultaneously with the lifting of the wide door. During their eight months of use, these air-operated doors have given no trouble whatever. The design was worked out by Lichter & Jens, consulting engineers, and the installation was supervised by the engineers of the Heine company.

The two central swing doors shown in the accompanying illustration are 27 feet high and 17 feet wide. They are operated from the inside by means of a crank. The latter is installed at the end of a shaft which passes through the brick wall at a convenient height for hand operation. On the outer end of this shaft is a pinion which engages a bevel gear. A vertical shaft connects the bevel gear with a spur gear which in turn engages a segmental rack.

The dimensions and design are such that the doors swing open with little exertion on the part of the operator, who does this while the air lifts the wide upper door. The swinging doors weigh about 2000 pounds each, are made of steel throughout, and are operated separately. The frame work is all-steel, hence there will be no warping, shrinking or sticking. When installing these doors a plumb line was made to pass through the hinge holes to insure perfect alignment. A smaller door is fitted into one of the large doors so well that it is invisible in the photograph. This small door is for the use of workmen in passing in and out, when the large doors are not needed.

Friction Cones Control Crane Movements

A crane, which is operated by friction cones and two electric motors, was brought out recently by the Lane Mfg. Co., Montpelier, Vt. Both motors are of the constant-speed, nonreversing type and afford three movements. The bridge girders are supported by cast-iron end trucks. The latter are provided with cast-iron, double-flange, chilled wheels. The trolley is designed for accessibility of all parts and is reinforced with steel tension rods. The sides are joined together by several large steel

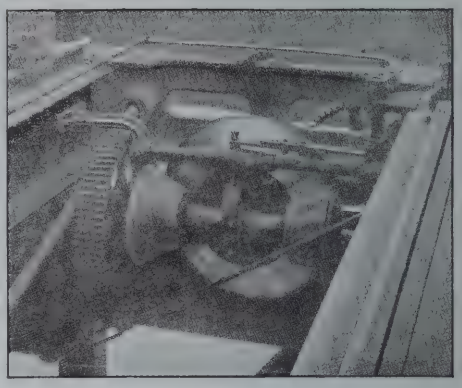

FIG. 1—FRICTION CONES PROVIDE HOIST AND TROLLEY MOVEMENT

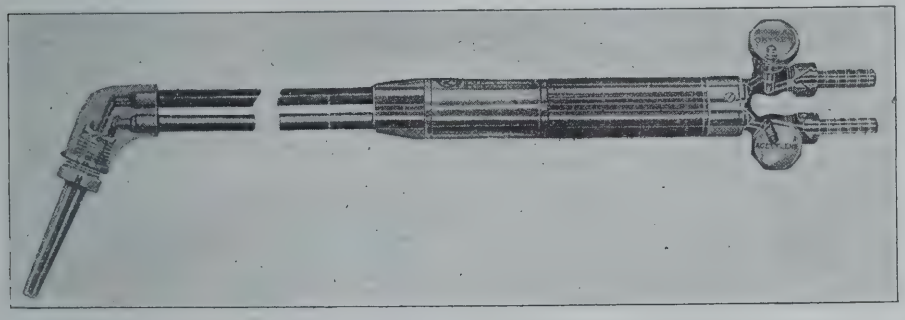
shafts. Power for hoist and trolley movement is transmitted by friction cones through steel worms and bronze gears running in oil. The cones are shown in Fig. 1.

The worm-gear drive acts as a load brake and is controlled by a hand wheel conveniently located. Two speeds of the hook are supplied with one part of rope. A luffe block is provided with a hook and a hinged-housed sheave, so that by running the line through this sheave and attaching the single-rope hook to a girt on the under side of the trolley, a two part reaving of the rope is effected, thereby supplying four hoist speeds.

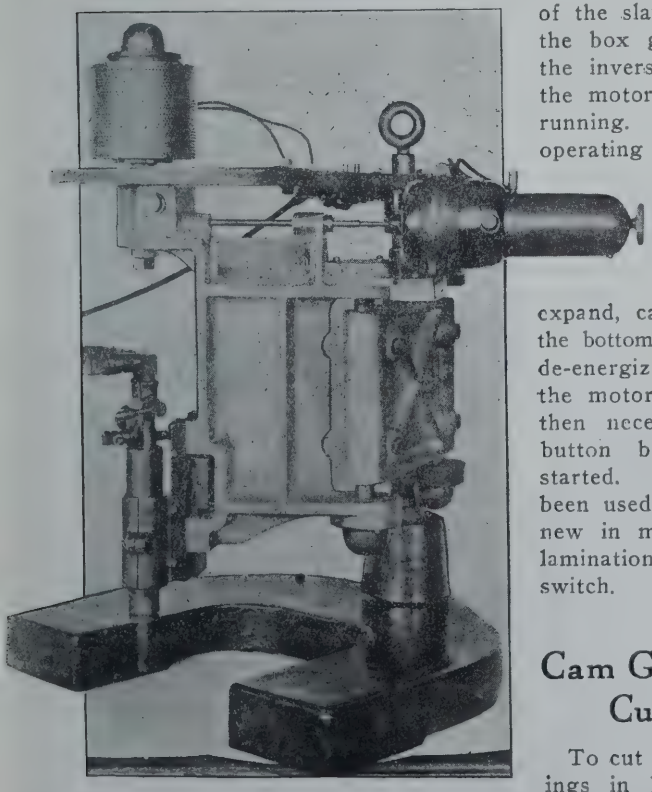


The hoist motor, through the same power cones, operates the trolley motion on the bridge at approximately 100 feet per minute. The reverse is obtained in the same manner as with the hoist movement. All movements are controlled by hand wheels. The bridge motor drives a friction disk by transmission through a pair of opposed cones, alternately contracting therewith. Control of the bridge travel movement in either direction is effected by shifting the cones by means of a lever connected to a rod running the full length of the bridge to the operator's station. The latter is shown in Fig. 2.

FIG. 2—OPERATOR'S PULPIT TRAVELS WITH THE TROLLEY TRUCK

Welding Torch Embodies New Features

A new welding torch, which embodies a number of unusual features, has been developed by the Air Reduction Sales Co., New York. The torch consists of an unusually small number of parts, some of the threaded connections prevalent in earlier models of welding torches being eliminated. The torch heads are drop-forged of the same material as the tip, so that both parts are subject to the same coefficient of expansion and contraction. In order that operators cannot make the mistake of connecting the feed hose to the wrong connection the oxygen valve is equipped with a right hand thread and the acetylene valve with a left hand thread, the nuts on the feed hose having corresponding threads. The handle is knurled and bears a stamped gas pressure table which serves as a permanent source of information for the operator. The valve handles are of octagon shape and are on the left side of the torch. It is claimed that on account of the manner in which the gases are mixed this torch will not backfire.

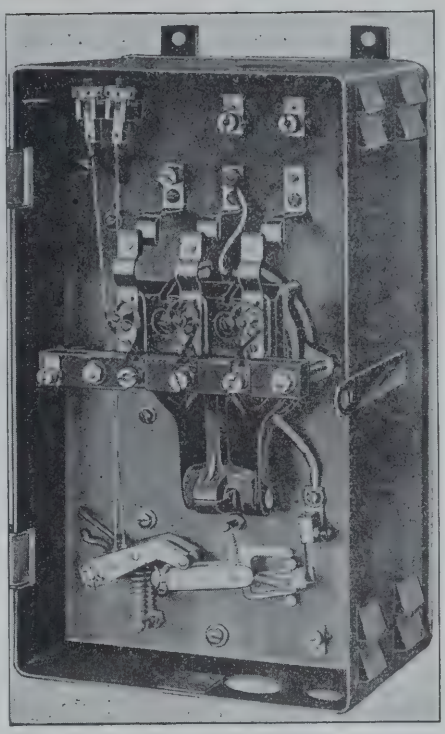


TORCH IN WHICH HEAD AND TIP ARE OF SAME MATERIAL AND SUBJECT TO THE SAME COEFFICIENT OF EXPANSION

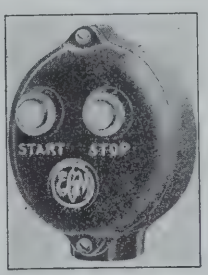
Switch Has New Type of Overload Protection

A new starting switch for induction motors, which is operated by push buttons, has just been developed by the Electric Controller & Mfg. Co., Cleveland. The switch is enclosed in a steel box, which is shown with cover removed in the accompanying illustration. It is provided with conduit connection for all wires. The switch is operated by push buttons, also arranged for conduit connection.

The two wires extending the length of the slate on the left hand side of the box give overload protection of the inverse time element type, while the motor is starting and when it is running. The wires are stretched and operating value of the overload protection is adjusted by changing the tension of the wires. If too much current is being taken by the motor, the wires will expand, causing the small contact at the bottom to be opened. This in turn de-energizes the magnet coil and cuts the motor off the power line. It is then necessary to push the "start" button before the motor can be started. This principle, which has been used in ammeters, is said to be new in motor starting practice. No laminations are use in part of the switch.



VARIOUS SHAPED HOLES ARE CUT AUTOMATICALLY BY USING DIFFERENT CAMS



Cam Guides Torch in New Cutting Apparatus

To cut hand holes and similar openings in boiler and ship plates and other wrought iron and steel sections, the Davis-Bournonville Co., Jersey City, has designed an oxy-acetylene torch which operates automatically. This machine, as shown in the accompanying illustration, comprises a cast-iron base with a U-shaped opening through which the torch flame strikes the work beneath.

At the back of the base is a vertical post to which a double-jointed radial arm is pivoted. The cutting torch is mounted on the outer end of the arm which provides for movement in any direction over the area covered. The jointed arm is made of two aluminum castings mounted on ball bearings. The path traversed by the torch is controlled by an internal cam at the top, the shape of which determines the shape of the opening made.

A feed roller on the outer end of the radial arm and surrounded by a yoke in which is placed the cam, is magnetized by a powerful electro magnet and is thus attracted to the inner face of the cam, the parts in contact being made poles of the magnet, one of which rotates and acts as a traction driver. The traverse feed is provided by a small variable speed electric motor mounted on the radial arm. The motor drives the feed roller through a double worm

ABOVE: STARTING SWITCH FOR INDUCTION MOTORS. OVERLOAD PROTECTION DEPENDS UPON THE TENSION OF WIRES AT LEFT. WIRES EXPAND WHEN TOO MUCH CURRENT IS TAKEN, OPENING CONTACT, DE-ENERGIZING COIL, AND CUTTING OFF POWER—*AT LEFT:* PUSH BUTTONS WHICH CONTROL ACTION OF STARTING SWITCH

reducing gear. The direct current which operates the motor energizes the electro magnet and is turned on and off by a push button. The speed of the motor is controlled by a small knurled disk on the motor itself.

The electrical control is connected with the torch oxygen valve in such a manner that when the oxygen is turned on the feed motion automatically starts and continues until the complete pattern has been cut. The cam holder permits ready change of cams. It is claimed that a hand hole having a periphery of 12 to 13 inches can be cut smoothly in ½ to ⅝-inch steel plate in one minute. The machine is provided with an eye bolt so that it can be handled by a traveling crane or hoist.

Ojibway Project

Is Being Pushed by Steel Corp.'s Canadian Subsidiary—More Resuming

Windsor, Ont., Oct. 13.—The Canadian Steel Corp., subsidiary of the United States Steel Corp., is increasing its activity in construction work at its new plant at Ojibway, near Windsor, Ont. The number of men at work has been increased to 500 and more would be employed if they could be obtained. Preliminary work is well advanced. The docks are well on the way toward completion. Foundations have been laid for four large blast furnaces, and the erection of two of them is in progress. The steel required for construction is being fabricated in the United States and partial deliveries will be made during the next few months. The furnaces are expected to be completed by next spring. They will rank with the largest in the United States, with a capacity of from 600 to 700 tons of pig iron per day.

The blooming and billet mills of the Dominion Steel Co.'s plant at Sydney, N. S., resumed operation last week after extensive repairs. With the exception of the open-hearth and blast furnaces all departments are in operation.

Operations also have been resumed at the open hearth of the Sydney mines plant of the Nova Scotia Steel & Coal Co. Two of the five furnaces resumed smelting, and in a short time it is expected the whole plant will be working to capacity. D. H. McDougall, president of the company; W. D. Ross, vice president, and Col. Thomas Canbley, chairman of the board of directors, sailed on Oct. 8 for England, the object of the trip being to extend the connections of the company abroad. They will endeavor to secure additional shipping accommodation to place the company in a position to regain the markets abandoned during the war.

The company has already sold coal in Holland and the Mediterranean and some enlargement of this trade is hoped for. Mr. McDougall stated that the company entertained great expectations of building up a large market for Wabana iron ore in Great Britain. With this object in view the development of the Wabana iron ores is being pushed. It also is expected that preliminary arrangements will be made which will result in orders from abroad for steel cars and heavy forgings used in ships.

Institute Program

For Sixteenth General Meeting at New York is Announced

Announcement of the program for the sixteenth general meeting of the American Iron and Steel institute to be held at the Hotel Commodore, New York City, Friday, Oct. 17, has been officially made. The usual buffet luncheon will be served between the morning and afternoon session. The banquet will be held at the Hotel Commodore, Friday evening.

The list of papers and addresses is as follows:

Address of the president: Elbert H. Gary.

The Work of the Bureau of Mines: Van H. Manning, director, bureau of mines, Washington, D. C.

X-Ray Examination of Metals: W. F. Ruder, research metallurgist, General Electric Co., Schenectady, N. Y.

Magnetic Analyses of Steel: R. L. Sanford, physicist, bureau of standards, Washington.

The Electrification of Reversing Steel Mills: Wilfred Sykes, Westinghouse Electric and Manufacturing Co., East Pittsburgh, Pa.

The Open Hearth Furnace and Processes: Henry M. Howe, Bedford Hills, N. Y.

Temperature Measurements in Steel Furnaces: G. K. Burgess, chief of the division of metallurgy, bureau of standards, Washington.

The Manufacture of Ingots for Locomotive Tires and Rolled Wheels: Lawford H. Fry, Standard Steel Works Co., Burnham, Pa.

The Blast Furnace Hearth: Walter Mathesius, superintendent blast furnaces, Illinois Steel Co., South Chicago.

There is to be a discussion of each paper under the five-minute rule.

Refractory Orders

Numerous—Shipments Held Up By Labor Shortage and Embargoes

Pittsburgh, Oct. 14.—The steel plant strike remains an important factor in the market for refractories. Just as many orders are coming out for fire clay and silica brick, however, as before the outbreak of the trouble and makers are keeping their plants running at a fairly high rate, but shipments are considerably restricted by the fact that most blast furnaces and steel plants still are short of common labor and this class of workmen is essential for the unloading and piling of such shipments.

Refractories

(Per 1000 f. o. b. works)

FIRE CLAY BRICK
(First Quality)

Pennsylvania	$36.00 to 41.00
Ohio	36.00 to 38.00
Kentucky	36.00 to 41.00
Illinois-Missouri	30.00 to 40.00

FIRE CLAY BRICK
(Second Quality)

Pennsylvania	$30.00 to 35.00
Ohio	20.00 to 25.00
Illinois-Missouri	25.00 to 30.00

SILICA BRICK

Pennsylvania	$40.50 to 45.00
Chicago	45.50 to 50.50
Birmingham	46.50 to 51.50

MAGNESITE BRICK
(Per Net Ton)

9 x 4½ x 2½	$80.00 to 85.00

CHROME BRICK
(Per Net Ton)

9 x 4½ x 2½	$80.00 to 90.00

BAUXITE BRICK
(Per Net Ton)

55 per cent.	$ 40.00 base
76 per cent.	100.00 base

Railroad embargoes are in force against most plants, as the administration is taking good care to guard against a shortage of rolling stock which would be sure to result because of the inability of the iron and steel companies to unload cars promptly under present conditions.

With the strike showing signs of disintegration, however, no uneasiness is felt among the makers of refractories, who are looking for an early resumption of normal deliveries. Plants are averaging around 70 per cent of capacity. No change is noted in prices, but the market is firm. Particularly is this the case in magnesite brick, as supplies of raw material still are meager, due to the fact that imports are almost nil.

The National Trading Co., Cleveland, contemplates the establishment of offices in Philadephila and Chicago.

Steel Exports Partially Recover

August Figures Exceed July Total, Equal April, But are Less Than May and June —Imports Register Small Increase Over July—Foreign Exchange Situation Still a Check on Export Business

ALTHOUGH exports of iron and steel for August regained part of the loss suffered in July, the month's total was materially less than that of June and May but practically equal to the figure of April. Imports for the month indicated a slight increase over July. The exchange situation apparently continues the major factor in holding overseas trade in iron and steel in check.

August exports totaled 396,743 gross tons compared with 287,685 tons in July, a gain of 109,058 tons or 38 per cent. Against the high record of exports of December, 1917, of 653,344 tons, the August figure represents 60.7 per cent. With three exceptions, gains were shown in every leading iron and steel product. The principal exception was pig iron, the total for which in August was only 36,071 tons compared with 42,327 tons in July. Some of the largest gains were made in steel billets, ingots and blooms, steel rails, structural iron and steel, sheets and plates, ship and tank plates, wire and pipes and fittings.

August imports gained only 2.58 per cent compared to a 34.2 per cent gain in July. The August total was 28,987 tons while that of July was 28,258 tons. The slight gain was sufficient however to give August the highest record since June, 1917, when 29,080 tons were imported. Losses in August occurred in structural shapes, rails, sheets and plates, tin and terne plate and tin scrap. All other products made gains, the most noticeable being pig iron and scrap.

Imports of iron ore expanded from 23,347 tons in July to 32,117 tons in August, the larger part of the increase coming from Sweden.

Conference Splits on Steel Strike

Organized Labor Now Misinterprets Purpose of the Meeting it Would Not Wait for, and Seeks to Divert It to Obtaining a Favorable Settlement—Many Plans Proposed for Elimination of Labor Troubles

WASHINGTON, Oct. 14.—Interjection of the steel strike into the deliberations of the industrial conference was not unexpected. While the conference had been arranged by President Wilson long before the strike was called and primarily was intended to deal more with fundamentals, the introduction by the labor group of resolutions asking for a conference committee to arbitrate the strike brought up the first real concrete problem for the conference's attention. Rules and plan of organization of the conference had, up to that time, been the storm center of debate, and gave indications of the heat which is expected to develop in the discussion of subjects now before the conference.

Samuel Gompers, chairman of the labor group, is said to have been unwilling to bring the steel strike into the conference, but was forced to do so by the more radical members of his group and members of the American Federation of Labor. Once in, however, Gompers naturally would have to fight for favorable action on the resolutions by the conference. That he intended to fight was indicated last Friday when a recess was taken until today. He objected to immediate adjournment without the general committee having first made its report on the steel strike resolution. Thomas L. Chadbourne, chairman of the general commitee, refused to say what subjects were under consideration by the committee.

Radicals Demand Consideration

The steel strikers having failed in their attempt to call out all the steel workers or to tie up effectively the plants of the manufacturers, or even win any semblance of support from the senate committee investigating the strike, were expected to ask the conference to help them. The President had indicated his willingness to intercede in their behalf when he sent Bernard M. Baruch to ask E. H. Gary to receive the strike organizers' commitee. And before the conference was resumed this morning it was generally conceded the labor group had purposely misinterpreted the President's intention in calling the conference. Unwilling to let the steel strike settle itself upon such fundamentals as the conference might approve, the radical element insisted Gompers present the one thing uppermost in their minds.

There was a report in circulation last week that Chadbourne and Baruch, because of Judge Gary's refusal to meet the labor unionists and his subsequent refusal to arbitrate the strike, were trying to win sufficient support in the public group to cast its vote with the labor group. Under the rules, each of the three groups, employers, employes and public, has one vote, to be determined by a majority vote in each group. All three votes must be unanimous on any proposition to commit the conference to that proposition. It is apparent the employers group would never consent to a vote favorable to the labor resolution. Consequently, while it was admitted the public and labor groups might agree on the strike resolution, and the employers oppose it, the action, it was said, would be decidedly embarrassing to Judge Gary, who is in the public group.

While the steel strike resolution was expected to be the main topic under consideration in the open conference today, attention also was given to other business brought before the conferees. This included a resolution by A. A. Landon, vice president, American Radiator Co., which would call off all strikes and lockouts for a period of three months in order that production may be stimulated to the maximum; proposals for a series of labor boards, similar to the national

NATIONAL INDUSTRIAL CONFERENCE

In the group are all of the delegates to the conference besides others, including leaders in finance and labor and representatives of farmers' organizations who are attending the sessions of the conference.

In the first row, left to right, are Samuel Gompers Jr., Matthew Woll, Louis Titus, Miss Sarah Conboy, Thomas Chadbourne, Samuel Gompers, Bernard Baruch, Miss Ida M. Tarbell, Judge E. H. Gary, Secretary of the Interior Lane, Secretary of Labor Wilson, Frank Morrisson, John D. Rockefeller Jr., M. F. Tighe, Miss Clara Sears Taylor, John Barrett, director of the Pan-American Union. In the second row are Hugh Kerwin, William Mahon, Robert S. Brookings, C. S. Barrett, Mr. Galloway, Dr. Charles W. Elliot, Henry B. Dennison, H. B. Endicott, L. E. Sheppard, Wm. H. Johnston, A. A. Landon, John H. Donlin, Bert M. Jewell. In the third row may be found George R. James, John Hays Hammond, Paul L. Feiss, Gavin McNab, Paul Scharrenberg, W. G. Lee and Lathrop Brown.

war labor board only more detailed, by Gavin McNab, John D. Rockefeller Jr., and Secretary Wilson, and numerous other measures, the more important of which, from the manufacturers' standpoint, being that introduced by the employers' group for consideration.

The employers presented a clear, concise statement of principles which is said to be the first comprehensive declaration yet made touching points made by labor in its various demands upon employers and in the declarations presented last week immediately after the introduction of the steel strike resolutions. Before the session was resumed today, it was believed the general committee may have consolidated the employers' and the employes' declarations into a single code and that, in the event of the failure of passage of the steel strike resolutions, the strike might be settled along the lines laid down. Of course, all the while it is borne in mind that Judge Gary has declared absolutely against interference by arbitration or any other method by outsiders.

Judge Gary is not the only steel representative in the conference. Among the others there is John D. Rockefeller Jr., a director of the Colorado Fuel & Iron Co., John W. O'Leary, secretary-treasurer of the Arthur J. O'Leary & Son Co., Chicago, and president of the National Metal Trades association; Herbert F. Perkins, president of the Wisconsin Steel Co., and Thomas L. Chadbourne, who was of counsel for the Midvale Steel & Ordnance Co. The conferees, by groups, are as follows:

PUBLIC: Bernard M. Baruch, chairman, E. H. Gary, John Spargo, Thomas L. Chadbourne, Dr. Charles W. Eliot, Charles Edward Russell, Fuller E. Calloway, John D. Rockefeller Jr., Robert S. Brookings, George R. James, O. E. Bradfute, Ward M. Burgess, Henry S. Dennison, Thomas D. Jones, A. A. Landon, H. B. Endicott, Paul L. Feiss, E. T. Meredith, Gavin McNab, Louis Titus, L. D. Sweet, Bert M. Jewell, Lillian D. Wald, Ida M. Tarbell and Gertrude Barnham.

EMPLOYERS: Harry A. Wheeler, chairman, Herbert F. Perkins, E. T. Trigg, John J. Raskob, Homer L. Ferguson, J. N. Tittemore, T. C. Atkeson, C. S. Barrett, E. L. Marston, Howard W. Fenton, L. F. Loree, Carl R. Gray, R. H. Aishton, Frederick P. Fish, J. W. O'Leary, S. Pemberton Hutchinson, and E. Farnham Greene.

EMPLOYES: Samuel Gompers, chairman, Frank Morrison, M. F. Tighe, Daniel J. Tobin, J. F. Valentine, W. D. Mahon, T. A. Rickert, Jacob Fischer, Matthew Woll, Mrs. Sara Conboy, William H. Johnston, Paul Scharrenberg, John H. Donlin, H. E. Wilis, Timothy Shea, W. G. Lee and L. E. Sheppard.

Principles Include Collective Bargaining

PRINCIPLES enunciated by the employers' group of the national industrial conference in a statement to the conference are as follows:

PRODUCTION—There should be no intentional restriction of productive effort or output by either the employer or the employe to create an artificial scarcity of the product or of the labor in order to increase prices or wages.

THE ESTABLISHMENT AS A PRODUCTION UNIT—The establishment, rather than the industry, as a whole or any branch of it, should, as far as practicable, be considered as the unit of production and of mutual interest on the part of employer and employe. Each establishment should develop contact and full opportunity for interchange of view between management and men, through individual or collective dealing or a combination of both.

CONDITIONS OF WORK—It is the duty of management to make certain that the conditions under which work is carried on are as safe and as satisfactory to the workers as the nature of the business reasonably permits. Every effort should be made to maintain steady employment of the workers both on their account and to increase efficiency.

WAGES—The worker should receive a wage sufficient to maintain him and his family at a standard of living that should be satisfactory to a rightminded man in view of the prevailing cost of living. Women doing work equal with that of men under the same conditions should receive the same rates of pay and be accorded the same opportunity for training and advancement.

HOURS OF WORK—The standard of the work schedule should be the week, varying as the peculiar requirements of individual industries may demand. Overtime should, as far as possible, be avoided, and one day of rest in seven should be provided.

SETTLEMENT OF DISPUTES—Each establishment should provide adequate means for the discussion of all questions and the just and prompt settlement of all disputes, but there should be no improper limitation or impairment of the exercise by management of its essential function of judgment and direction.

RIGHT TO ASSOCIATE—The association of men, whether of employers, employes or others, for collective action or dealing confers no authority and involves no right of compulsion over those who do not desire to act or deal with them as an association. Arbitrary use of such collective power to coerce or control others without their consent is an infringement of personal liberty and a menace to the institutions of a free people.

RESPONSIBILITY OF ASSOCIATIONS—Every association, whether of employers or employes, must be equally subject to public authority and legally answerable for its own conduct or that of its agents.

FREEDOM OF CONTRACT—With the right to associate recognized, the fundamental principle of individual freedom demands that every person must be free to engage in any lawful occupation or enter into any lawful contract as an employer or an employe and be secure in the continuity and rewards of his effort.

THE OPEN SHOP—The principles of individual liberty and freedom of contract upon which our institutions are fundamentally based require that there should be no interference with the open shop. While fair argument and persuasion are permissable, coercive efforts aimed at turning an open shop into a closed union or closed nonunion shop should not be tolerated. No employer should be required to deal with men or groups of men who are not his employes or chosen by and from among them.

THE RIGHT OF STRIKE OR LOCKOUT—In the statement of the principle that should govern as to the right to strike or lockout, a sharp distinction should be drawn between the employment relation in the field (a) of the private industry, (b) of the public utility service and (c) of government employment, federal, state or municipal.

In private industry the strike or the lockout is to be deplored; but the right to strike or lockout should not be denied as an ultimate resort after all possible means of adjustment have been exhausted. Both employers and employes should recognize the seriousness of such action and should be held to a high responsibility for the same. The sympathetic strike is indefensible, antisocial and immoral. The same may be said of the blacklist, the boycott and also of the sympathetic lockout.

In public utility service the public interest and welfare must be paramount and controlling consideration. The state should, therefore, impose such regulations as will assure continuous operation, at the same time providing adequate means for the prompt hearing and adjustment of complaints and disputes.

A strike of government employes is an attempt to prevent the operation of government until the demands of such employes are granted, and cannot be tolerated. The right of government employes to be heard and to secure just redress should be amply safeguarded.

TRAINING—Practical plans should be inaugurated in industry and outside of it for the training and upgrading of in-

dustrial workers, their proper placement in industry, the adoption and adaptation of apprenticeship systems, the extension of vocational education and such other adjustments of our educational system to the needs of industry as will prepare the worker for more effective and profitable service to society and to himself.

Plans Proposed for Settlement of Labor Disputes

SEVERAL important plans for the adjustment of labor disputes have been submitted to the national industrial conference, among them being one worked out by Secretary of Labor Wilson. Secretary Wilson gave the conference the following outline of his plan:

"There shall be created a board of equal numbers of employers and employes in each of the principal industries and a board to deal with miscellaneous industries not having separate boards. The representatives of labor on such boards shall be selected in such manner as the workmen in the industry may determine. The representatives of the employers shall be selected in such manner as the employers in the industry may determine.

"Whenever any dispute in any plant or series of plants that can not be adjusted locally the question or questions in dispute shall be referred to the board created for that industry for adjustment. The board shall also take jurisdiction whenever in the judgment of one-half of its members a strike or lockout is imminent. Decisions of the board on questions of wages, hours of labor, or working conditions must be arrived at by unanimous vote. If the board shall fail to come to a unanimous determination of any such question, the question in dispute shall be referred to a general board appointed by the President of the United States in the following manner:

"One-third of the number to be appointed in agreement with the organization or organizations of employers most representative of employers; one-third of the number to be appointed in agreement with the organization or organizations of labor most representative of labor; one-third of the number to be appointed by the President direct.

"Any question in dispute submitted to the general board for adjudication shall be decided by the unanimous vote of the board. If the general board fails to arrive at a decision by unanimous vote the question or questions at issue shall be submitted to an umpire for determination. The umpire shall be selected by one of the two following processes: First, by unanimous selection of the general board. Failing of such selection, then the umpire shall be drawn by lot from a standing list of 20 persons named by the President of the United States as competent umpires in labor disputes.

"In all disputes that may be pending locally, or before the industrial board, or before the general board, or before the umpire the employers and employes shall each have the right to select counsel of their own choice to represent them in presenting the matter in controversy.

"Whenever an agreement is reached locally, or by the unanimous vote of the industrial board, or by the unanimous vote of the general board, or by the decision of the umpire the conclusion arrived at shall have all the force and effect of a trade agreement which employers and employes shall be morally bound to accept and abide by.

"It is understood that this plan would not interfere with any system of joint wage conferences now in existence unless or until the failure to agree in such a conference made a strike or lockout imminent."

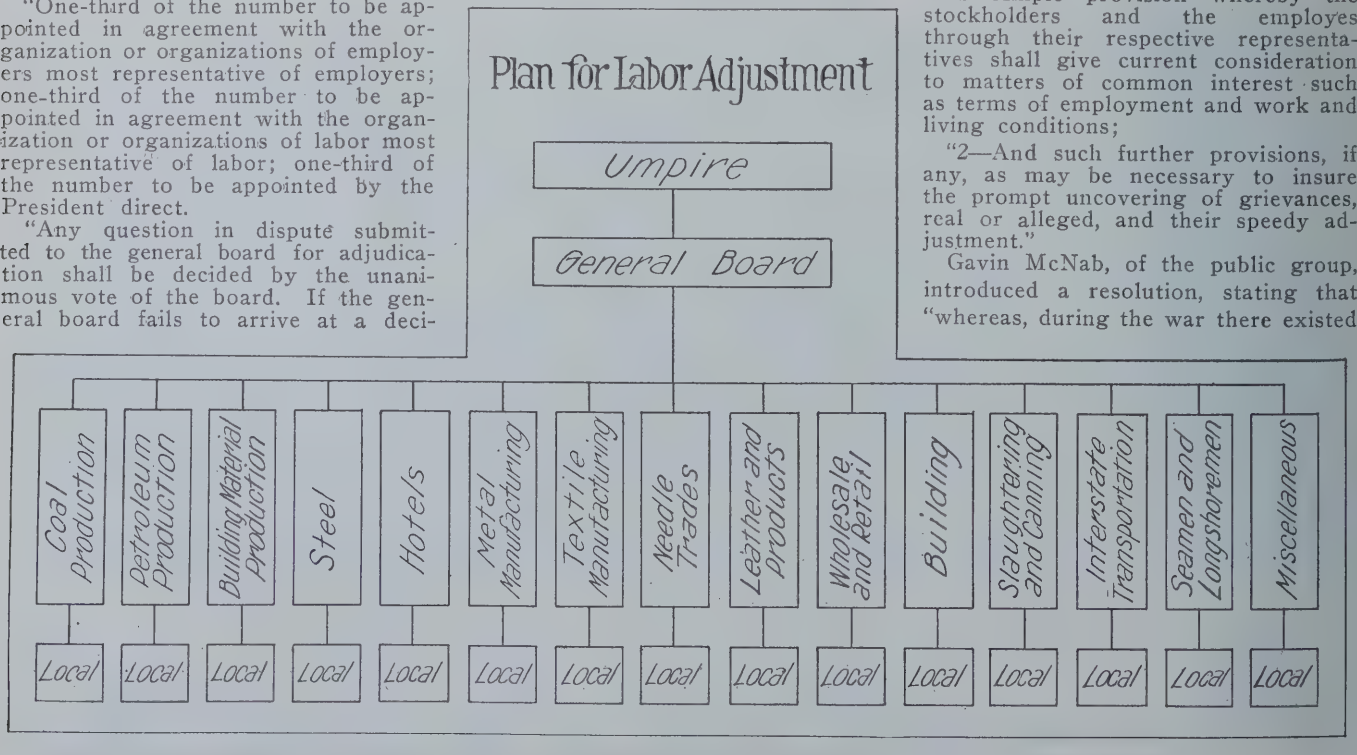
John D. Rockefeller Jr., proposed the following plan for settlement of industrial disputes:

"Whereas, the common ground of agreement and action with regard to the future conduct of industry, and the development of a new relationship between capital and labor which the President sought in calling this conference can only be discovered as we approach the problem in the spirit of justice, brotherhood, and of willingness to put one's self in the other man's place, the coming of which means the substitution of confidence for distrust, of good will for enmity, of co-operation for antagonism; and

"Whereas, this spirit can be developed only by the resumption of personal relations between employer and employe or the nearest possible approach thereto; and

"Whereas, some form of representation in industry is essential in order to make personal relations possible under modern industrial conditions: Now therefore be it

"Resolved, that this conference recognizes and approves the principle of representation in industry under which the employes shall have an effective voice in determining their terms of employment and their working and living conditions; and be it further



"Resolved, that just what form representation shall take in each individual plant or corporation, so long as it be a method which is effective and just, is a question to be determined by the parties concerned in the light of the facts in each particular instance; and be it further

"Resolved, that any form of representation to be adequate must include:

"1—Ample provision whereby the stockholders and the employes through their respective representatives shall give current consideration to matters of common interest such as terms of employment and work and living conditions;

"2—And such further provisions, if any, as may be necessary to insure the prompt uncovering of grievances, real or alleged, and their speedy adjustment."

Gavin McNab, of the public group, introduced a resolution, stating that "whereas, during the war there existed

FORM FOR ORGANIZATION OF INDUSTRIAL BOARD FOR SETTLEMENT OF LABOR DISPUTES AS PROPOSED BY SECRETARY OF LABOR WILSON

such a body known as the war labor board, which was measurably successful in the adjustment of controversies between capital and labor," the conference petition the President to recommend to congress the immediate enactment of legislation creating a national board of conciliation and arbitration.

The board would be constituted as follows: "Four members, at least one of whom shall be a woman to be appointed by the President, two members to be chosen by the senate, and two members to be selected by the house of representatives. The remainder of said board shall consist of ex-presidents of the United States and the secretary of the department of labor." The resolution proceeds to say:

"Said board shall be available for determination of all disputes between labor and capital. It may act as a board on request by the parties to a controversy or may appoint one of its members to act as third party where each party has appointed a representative and so requests.

"It shall have the right as a board to summon witnesses, to send for parties and papers and conduct full investigations. Any member of such board appointed to conduct a hearing or to make an investigation or to act as third party member of a board of arbitration shall have the power to summon witnesses and compel attendance and compel production of papers for a distance of 50 miles from the place of hearing.

"It shall be a condition of any arbitration conducted by this board that in the interests of the public, that both parties to the controversy shall continue to resume normal relations, but that the decision when rendered shall relate back to the date of the controversy and be in its effects retroactive."

Declaration of Principles Made by Labor

ORGANIZED labor represented in the employes' group of the national industrial conference submitted the following as its declaration of principles:

"1—The right of wage-earners to organize in trade and labor unions for the protection and promotion of their rights, interests and welfare.

"2—The right of wage-earners to bargain collectively through trade and labor unions with employers regarding wages hours of labor, and relations and conditions of employment.

"3—The right of wage-earners to be represented by representatives of their own choosing in negotiations and adjustments with employers in respect to wages, hours of labor, and relations and conditions of employment.

"4—The right of freedom of speech of the press and of assemblage, all being responsible for their utterances and actions.

"5—The right of employers to organize into associations or groups to bargain collectively through their chosen representatives in respect to wages, hours of labor, and relations and conditions of employment.

"6—The hours of labor should not exceed eight hours per day. One day of rest in each week should be observed, preferably Sunday. Half-holiday on Saturday should be discouraged. Overtime beyond the established hours of labor should be discouraged, but when absolutely necessary should be paid for at a rate not less than time and one-half time.

"7—The right of all wage-earners, skilled and unskilled, to a living wage is hereby declared, which minimum wage shall insure the workers and their families to live in health and comfort in accord with the concepts and standards of American life.

"8—Women should receive the same pay as men for equal work performed. Women workers should not be permitted to perform tasks disproportionate to their physical strength or which tend to impair their potential motherhood and prevent the continuation of a nation of strong, healthy, sturdy and intelligent men and women.

"9—The services of children less than 16 years of age for private gain should be prohibited.

"10—To secure a greater share of consideration and co-operation to the workers in all matters affecting the industry in which they are engaged, to secure and assure continuously improved industrial relations between employers and workers and to safeguard the rights and principles herein before declared, as well as to advance conditions generally, a method should be provided for the systematic review of industrial relations and conditions by those directly concerned in each industry.

"To this end, there should be established by agreement between the organized workers and associated employers in each industry a national conference board, consisting of an equal number of representatives of employers and workers, having due regard to the various sections of the industry and the various classes of workmen engaged, to have for its object the consideration of all subjects affecting the progress and well-being of the trade, to promote efficiency of production from the viewpoint of those engaged in the industry and to protect life and limb, as well as safeguard and promote the rights of all concerned within the industry.

"With a further view of providing means for carrying out this policy, the federal government, through its department of labor, should encourage and promote the formation of national conference boards in the several industries where they do not already exist. To still further encourage the establishment of these national conference boards in each industry, these conference boards should be urged whenever required to meet jointly, to consider any proposed legislation affecting industries in order that employers and workers may voluntarily adopt and establish such conditions as are needful, and may also counsel and advise with the government in all industrial matters wherever needful legislation is required.

"The federal government should also undertake to extend the functions of the department of labor to ascertain and provide adequate information and advice to the several national conference boards on all matters affecting the life, health, and general welfare of the wage-earners within such industries."

Address Foundrymen

At the October meeting of the New England Foundrymen's association held Oct. 7 at the Exchange club in Boston, Harry D. Gates of the Pangborn Corp., Hagerstown, Md., gave an illustrated talk on sand blasting in its relation to the foundry. Robert A. Lamont of the Boston branch of the Mercury Mfg. Co., presented a moving picture film which he called the "trackless train" and which showed interesting applications of the small truck tractor in industrial establishments. Edgar C. Davidson of the Safety First Shoe Co., was unanimously voted a new member of the association.

Machinery Exposition is Opened in New York

For the sale at home and abroad of products manufactured in America, a permanent exhibition has been established at Grand Central palace, New York City. This is under the auspices of the International Exposition of Industries, which comprises the international machinery and mining industries, factory appliances and municipal equipment expositions as well as farm tractor and implement and hardware and house-furnishing exchanges. A centralized market where all lines of American manufactured products can be grouped under one roof and where manufacturers and buyers can meet and enter into immediate business arrangements, is thus furnished for the first time.

Europe's demand for reconstruction materials is expected to bring a great number of representatives from overseas, and full preparations have been made at the exposition to display the required material so that they may have a comprehensive selection to choose from. The attention of purchasing agents, both in Europe and in this country, has been called to Grand Central palace with its permanent industrial market by representatives of trade corporations.

Steel Suit Before Highest Court

Government Attack on United States Steel Corporation Finally Reaches Supreme Court, an Argument Situation Expected Early in 1920—Counsel for Defense Charge Government Abandons its Original Theory of Illegality

WASHINGTON, Oct. 14.—Eight years practically after it was filed, the government suit to dissolve the United States Steel Corp. finally has been submitted to the United States Supreme court. While necessarily it is uncertain when this case, the most important anti-trust proceedings ever before the supreme court, will be decided, it is considered by some that the finding may be handed down shortly after the New Year. Upon that decision will rest the question whether the Steel corporation, with its highly organized development is to be broken up into individual units or whether it is to be maintained as a single entity and continue as an economic factor of the greatest importance in the industrial world. In the lower court the finding was favorable to the Steel corporation, which prompted the government to appeal to the Supreme court, and business interests generally are hoping that the finding of the lower court will be affirmed by the Supreme court.

The original suit was filed in a federal court in Trenton, N. J., on Oct. 26, 1911. The final arguments, which were begun on Monday of last week were completed on the following Friday. The government's side was presented by Assistant Attorney General C. B. Ames and Attorney Henry E. Colton. Judge Ames both opened and closed the arguments, and succeeded former Assistant Attorney General G. Carroll Tod, who previously had charge of the government's prosecution. The Steel corporation's side was presented by General Counsel Richard V. Lindabury and Attorneys D. A. Reed and C. A. Severance.

Chairman E. H. Gary of the Steel corporation sat with other spectators and heard the opening argument made by Mr. Lindabury on Wednesday afternoon and was also present on the last day of the arguments to hear those made by Mr. Reed and Mr. Severance. With him on the first day he listened to the arguments were Comptroller William J. Filbert and the former's private secretary, George K. Leet, together with James B. Bonner and other representatives of the local offices of the corporation. On Friday he was accompanied by Mr. Leet and representatives of the corporation. He listened intently to the arguments, and at times, in order to catch the statements by the attorneys or the questions asked by the justices, he would lean forward and cup his ear, but his expression remained unchanged. By coincidence the day on which Judge Gary heard the opening argument for the corporation, which meant so much to it and to himself, was the seventy-third anniversary of his birth.

Gary Hears Arguments

At the request of Judge Ames the government is going to have its arguments printed and copies will be supplied to the court by Friday of the present week. General Counsel Lindabury said the corporation did not wish to have its arguments printed, so this will not be done. It is unusual either to have a stenographic report made of arguments before the Supreme Court or to have them printed. The practice is resorted to only in the most important cases and done through the request of counsel presenting cases upon the approval of the court.

In its arguments the government maintained its original charge, said Judge Ames, that the Steel corporation at the time of its organization in 1901 was a combination in violation of the Sherman antitrust law and still is; that it is a preponderating factor in the steel industry and can control prices and restrain trade. Counsel for the corporation contended that the corporation was not formed for purpses of monopoly, has never attempted to monopolize or monopolized the trade and could not monopolize it if it desired. It was pointed out that subsidiaries of the corporation produce only about 40 per cent of the steel consumed in this country and about 45 per cent of the total steel output of the country, and that the srength of its competitors is so great that it could not dominate the market.

In opening the case for the government, Judge Ames made a lengthy review of the organization of subsidiaries of the Steel corporation, their methods of conduct, including pooling plans, etc., and left up to the formation of the corporation itself, claiming it was organized for purposes of monopoly. He contended that pooling agreements which had been made by the different steel company groups were not lived up to in 1898 and that the result was competition. The average price of 10 specified steel commodities in December, 1898, he said, was $28.28 a ton, while in March, 1900, when it was charged the agreements had been renewed, the average price of the same commodities had increased to $57.50. It was maintained that the corporation still has the power of domination and monopoly of the industry and when asked by Chief Justice White what remedy the government sought, Judge Ames replied that no complete plan had been worked out. He said, however, the government is asking for dissolution of the holding company, the Steel corporation, and several of the subsidiaries. The latter, it was declared, should be under direct control and active management. Each was said to have a complete organization and clearly is equipped for efficient service. Judge Ames did not name all the subsidiaries which he contended should be dissolved, but mentioned the Tennessee Coal, Iron & Railroad Co., the Carnegie Steel Co., the American Steel & Wire Co., and the American Sheet & Tin Plate Co. In his closing argument, however, he assented to a view by Chief Justice White that the latter understood the charge against the Tennessee Coal, Iron & Railroad Co. was not being pressed. Judge Ames said it was the thought of the department of justice that the court would not care to have its opinion as to how the dissolution should be brought about but that it might be worked out along the plan followed in the tobacco case. Attorneys for the corporation in their arguments contended that the government had admitted that a number of Steel corporation subsidiaries had been formed legally, including the Federal Steel Co., the Carnegie Steel Co., the Union Steel Co., the Shelby Steel Tube Co., and the Tennessee Coal, Iron & Railroad Co., and that the government had abandoned these and numerous other charges. In addition to the claim that the Steel corporation has a substantial domination of the steel industry, Judge Ames said it has control of the transportation of ore from

the Lake Superior district and of ore deposits there.

In opening arguments for the Steel corporation, General Counsel Lindabury said that the argument of Judge Ames was so different to the position of the court below, and to that of counsel for the government in the original case that it was rather confusing. It was stated by Mr. Lindabury that the government apparently had abandoned its brief and was presenting a different theory than that in the brief or ever heard before. Consequently, he said, any attempt to argue from the points made in the brief and those of Judge Ames was somewhat difficult. The strength of the argument of Judge Ames, it was asserted, was devoted to the organizations taken over by the Steel corporation 19 years ago, which dealt most with "ancient history." At some length, however, Mr. Lindabury pointed out the evolution of the iron and steel industry since the early 80's, the time of the old iron mills. Production of steel in this country, it was declared, did not become great until 1885 when Thomas and Gilchrist discovered a way to remove phosphorus from iron, resulting in reducing the cost of manufacture and destroying many iron mills. The greatest change of all, he said, was advent in 1890 of the Jones mixer, by which hot metal is carried direct to the open-hearth furnace. This also drove many iron mills out of business and those that still existed had to be consolidated as salvage, he said, and modernized if they were to continue, and this was given as an explanation of the formation of what now are subsidiaries of the Steel corporation.

Mr. Lindabury said that the charge that subsidiaries had been organized with monopolistic intent was based on a mistaken idea, declaring that the only articles they produced in 1899, one of the years referred to by Judge Ames, were tinplate, wire nails and tubes and that the rise in the prices of these commodities was not disproportionate with the rise of such commodities in Germany and England. The advances of which the government made so much, he said, meant nothing either way and could not be applied to prices on those commodities made by subsidiaries at the time.

The proportion of the production of steel by the Steel corporation, he said, was never more than 50.1 per cent of the total output, and this proportion, he maintained, has gradually fallen until at the time hearings on the case were closed it was only 45 per cent of the total output and 40 per cent of the steel consumed in the United States. The corporation's proportion of ore reserves, it was said, is a less percentage than that of any of the large independent steel companies. He said the corporation has approximately a 40 years' supply of ore reserves, while it is estimated it should have a 50 years' supply, which he said the independents have. Monopoly of ore, he said, is out of the question. Regarding the transportation of ore from the Lake Superior district, Mr. Lindabury said that after complaints had been made by independent companies as to the rates charged by the Steel corporation two rail lines carrying ore to the docks, the interstate commerce commission reduced the charges. It was added that it always has been conceded by the independents that they get as good service in the transportation of ore as the subsidiaries themselves do.

In continuing his argument on Thursday, Mr. Lindabury, replying to a question by Justice Day, said the lower court had held that the corporation did not have the power to fix prices, divide territory, or to control the industry. Reiterating that at the time of its organization, the Steel corporation produced 50.1 per cent of the rolled steel output of the country, Mr. Lindabury said this really gave an exaggerated idea of its power from a point of sales because the corporation subsidiaries used much of the semifinished steel it made for the manufacture of finished products.

Pools Are Discussed

Taking up the question of pools, Mr. Lindabury said the Steel corporation withdrew in 1904 from all of them in which it had participated with the exception of the wire pools and the latter, he said, were operated secretly for several years afterward by an agent of the Steel corporation without the knowledge of corporation officials. The pools, when operated, said Mr. Lindabury, were thought to be legal because of an opinion given by the late Senator Hoar, who drew the final draft of the Sherman act and who had written to a friend in Worcester, Mass., that the steel pools that he did not think they came within the prohibition of the law. In 1904, however, Mr. Lindabury told the court, an attorney connected with an independent steel company held that the pools did violate the Sherman law and because of this the Steel corporation withdrew. The so-called Gary dinners, said Mr. Lindabury, were three in number and were held in 1907-08, when the industrial situation was perilous and the conferences were designed to stabilize industry. This movement, he said, was participated in by 90 per cent of the steel industry.

Referring to the purchase by the Steel corporation of steel plants, Mr. Lindabury said it is a remarkable fact that it never bought one of them for the purpose of scrapping and he ventured the opinion that there probably is not a similar case of the kind in any trust suit brought to the attention of the Supreme Court.

Attorney Colton, followed Mr. Lindabury and said that, contrary to the statement of Mr. Lindabury, the government still stood on its original brief and holds that the Steel corporation, as a result of the wholesale combination of competitors, resulting in restraint of trade, does dominate the industry and was formed for illegal purposes and still is an illegal corporation.

Declaring that even if it were true that the Steel corporation lost money during the war, Mr. Colton said this would be no reason for not dissolving the corporation. He asserted, for that matter, that the truth is the corporation made enormous profits during the war. But, he maintained, nothing the corporation did during the war had anything whatever to do with the present case.

"You consider that that is outside of the record, do you?" asked Justice Day.

"Yes, your honor, we do," replied Mr. Colton.

With respect to the alleged power of the Steel corporation to control prices, etc., which Mr. Colton had discussed, Justice McKenna asked if any competitor had come forward and said it was compelled to take prices named by the Steel corporation.

Mr. Colton replied that the independent companies "very glady accepted the prices named by the corporation."

"In other words, you consider that the corporation kept its prices so comfortably high that the others were glad to accept them?" inquired Justice Pitney.

Mr. Colton answered in the affirmative.

At the time hearings in the case were closed eight years ago, said Attorney Reed, the Steel corporation had only about 46 years' supply of standard ore in reserve in the Lake Superior district as against a supply of 63 years held by its competitors. In sight in the Lake Superior district, he said, is about 2000 years' supply of the lower grades of ore.

Mr. Reed said the law does not forbid combinations which allow reasonably competitive conditions to prevail. To show such conditions do prevail, he adopted the government's

own figures as to the prices of 10 commodities and explained that the prices on steel since the organization of the Steel corporation had gone down in money price while other commodities had gone up. Other reasons he gave were the growth of the industry as a whole, competitors from 1901 to 1918 increasing output from 4,000,000 to 24,000,000 tons annually; growth of competitors out of all proportion to that of the Steel corporation, and the fact that steel purchasers find there has been extremely active competition prevailing. The government's case as to suppression of competition, he said, was made up entirely of inferences and not by any testimony whatever.

The government, he said, would determine the case upon conditions as they existed in 1901, when the corporation was organized, and would ignore the intervening years. He maintained and read court decisions to prove that it is proper to take into account the intervening years and said it was shown that the corporation never committed or intended an offense in the first place.

In his argument, Attorney Severance said that the government had abandoned numerous charges, including those that the Carnegie Steel Co., the Federal Steel Co., the Union Steel Co., and the Shelby Steel Tube Co., were formed illegally. Touching upon the Tennessee Coal, Iron & Railroad Co., Mr. Severance said charges as to it had also been abandoned and Chief Justice White said he understood these particular charges were not being pressed. Attorney Severance said that the government also had charged that the Steel corporation was guilty by reason of its connection with the various pools, but that this claim like others, has been abandoned, as has been the charge that the corporation restrained and monopolized foreign trade.

In substance, he said, the case has settled down to a charge that the corporation has a preponderating share in the steel business of the United States. He dwelt at some length on this point to show that the corporation could not be a preponderating element because of its production of only about 40 per cent of the steel consumed in this country and by reason of the strength and large production of independent companies. Decrees of courts were cited to show that the corporation does not come within the antitrust act, that in the International Harvester Co. in particular being quoted.

Competition in the steel trade, he pointed out, is "active, normal, keen and vigorous." Speaking of the simularity of steel prices quoted in trade papers, Mr. Severance said they are only comparative and that there are no absolute market prices because there is no exchange in which steel is sold as is the case with grain or stocks. The Gary dinners were explained as a movement in years of industrial peril which was meant to stabilize conditions in the industry and had been justified in the decision of Judge Woolley in the lower court. In any event, he argued, the movement did not have anything to do with the case because the suit has been brought to dissolve the Steel corporation and not all of those in the movement.

Judge Ames in closing the case summarized the government's contentions that the corporation was and is a combination in violation of the law and said the controversy hinged on two main points: first, whether constituents of the corporation were competitors of each other, and, second, the effect of the subsequent conduct of the corporation since it was organized. He claimed the constituents of the corporation had been competitors and that the subsequent conduct of the corporation showed it was and is a monopoly.

Dealing with the growth of competitors of the corporation, Judge Ames said it merely indicated the growth of the industry itself. The Steel corporation, he said, has grown 40 per cent and increased its output 2,500,000 since 1901, and that the Bethlehem Steel Co., with the greatest growth in percentage amounting to approximately 3700 per cent, had increased its output only 700,000 tons.

The Steel corporation, he maintained, can dictate terms and prices to its competitors and the question as to whether or not it is a benevolent corporation has nothing to do with the present case.

Neither Justice McReynolds nor Justice Brandeis sat in the case, although during the last day they were on the bench and listened to arguments. Justice McReynolds was disqualified because of having been attorney general during earlier proceedings in the suit and Justice Brandeis did not participate because of previous expressions he has made regarding the Steel corporation.

The New York chapter of the American Steel Treater's society held its monthly meeting Oct. 15, at the Bush Terminal Sales building, 132 West Forty-second street, New York. R. W. Newcomb, of the Charles Engelhard Co., read a paper entitled: "Precautions Involved in the Use and Care of Pyrometer Equipments."

Better Output

Shown in Benzol But it is Only Fraction of Normal

New York, Oct. 11.—As virtually no nearby offerings are being made, quotations on spot benzol largely are nominal. The steel strike has made great inroads upon production and dealers have but little or no benzol left after meeting old contracts. Contract business is being quoted at 24 to 29 cents for pure benzol and at 22 to 24 cents for 90 per cent benzol. The improvement in production, while noticeable, is not keeping pace with the clearing up of the strike situation generally. It is said that men now returning to work are for the most part in some branch of the industry other than coke producing. The Chicago district is producing some benzol, but the Mahoning valley is reported to be inactive. Production now is about 35 per cent of normal, as compared with around 25 per cent a couple of weeks ago.

Toluol and solvent naphtha, although affected by the strike are available in better quantities for spot as demand has not been heavy. The market on toluol and solvent naphtha is quoted at 26 to 30 cents, and 22 to 27 cents, respectively, for both spot and contract.

Buying by the drug trade for next season features the naphthalin market. The dye industry also is figuring but not on so large a scale. Owing to the large demand, spot material is very scarce, and prices, consequently, largely are nominal. Spot and contract business may be quoted at 6½ to 7½ cents on flakes and 8½ to 9½ cents on balls.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.40 to 3.65

Contract

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds Producers' Plants

Sulphate of ammonia	3.25 to 3.40

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

SALE of its warehouse plant, stock and good will to Joseph T. Ryerson & Chicago, is announced by the Ferguson Steel & Iron Co., Buffalo, following its recent organization. The new owners will make this the fifth unit in their chain of warehouse plants, which already includes plants at Chicago, New York, Detroit and St. Louis.

This latest purchase includes a main building of about 100,000 square feet, divided into three spans, served by several bridge cranes, together with a large crane-served yard, office building, garage and storehouse. It is located on the New York Central railroad and adjoins the main Buffalo yards. This location provides excellent rail transportation facilities. The plant is also well situated for rapid city delivery by motor truck. While plans are not yet fully determined, a considerable improvement and enlargement of the property will be undertaken this winter. After these improvements, it will comprise a complete unit for warehouse service to supply finished steel products, covering an extensive range of standard mill sections, with a complete installation of cutting and handling equipment. Exceptional facilities for cutting length stock will be featured by the new owners. In addition a varied stock of special items called for in connection with warehouse business will be carried.

This arrangement was perfected in order to supply the needs of steel users in western New York and Pennsylvania, northeastern Ohio and Ontario. A. C. Allshut is in charge.

* * *

FOUNDATION for one 600-ton blast furnace has been completed at Ojibway, Ont., for the Canadian Steel Corp., and work has been started on a second.

* * *

FOR installation at the Mitsubishi shipyard at Kobe, Japan, C. H. vom Baur, 15 Park Row, New York, has sold a 1-ton electric furnace to Mitsubishi Zozen Kaisha. It will be employed for making basic steel for castings.

* * *

WORK on the erection of a plant for the manufacture of cans for the Tacoma Can Co., Tacoma, Wash., is nearing completion, and operations in the new plant are expected to be started soon. The building will have a total floor space of 9300 square feet.

* * *

THE Atlantic Steel Co., Atlanta, Ga., now is represented in the New York metropolitan district by Baird & Martin, Inc., 120 Liberty street, New York City. This firm consists of Charles T. Baird, president; Percival V. Martin, vice president, and Lawrence H. Tasker, treasurer.

* * *

ORDERS have been issued for dismantling the Dantzler Foundry & Machinery Co., Gulfport, Miss. The plant has been closed for some time because of a strike and a decision to quit business was made following the rejection of the workers of an invitation to return to work at the old wage scale.

* * *

FOR the purpose of manufacturing automobile radiators, the Lockport Auto Radiator Corp., 291 Market street, Lockport, N. Y., has been formed with temporary offices at 175 Walnut street, that city. Capital stock is $30,000 and while a plant has been secured, the company requires stamping presses, spot welders and other small tools.

* * *

CONTRACTS have been made by the H. P. Deuscher Co., Seventh and Honover streets, Hamilton, O., for the new equipment it will require for its new core ovens and core room, 100 x 50 feet, and cranes for its new foundry, 45 x 60 feet. These new buildings are to be of brick and concrete construction and will cost approximately $25,000.

* * *

THE Dickey Steel Co., Inc., Woolworth building, New York City, recently was appointed eastern sales and export representative of the Hammond Steel Co., Inc., Syracuse, N. Y., manufacturer of high speed, alloy and straight carbon tool steels, as well as a complete line of alloy steel bars, weldless rings, die blocks and special shapes.

* * *

BIDS are under consideration by the Ohio Steel Products Co., Mineral Ridge, O., for the erection of two buildings, one, 60 x 400 feet, to be used as a tube mill, and the other, 70 x 272 feet, for a conduit plant. The buildings will be of brick and steel construction and will be equipped with the most modern machinery. C. E. T. Tousley is vice president.

* * *

EDWARD S. FRENCH, secretary and treasurer of the Belleview Utilities Co., Inc., Belleview, Fla., has advised that the company, which recently was incorporated to operate electric light, water and cold storage plants, is in the market for storage tanks, 8000 to 10,000 gallons capacity, and water tanks, 10,000 to 20,000 gallons capacity and a quantity of 2-inch wrought pipe.

* * *

IN July the Granby Consolidated Mining, Smelting & Power Co. began to produce coke and by-products in its coke ovens at Anyox, B. C. The plant, which is the only one of its kind on the Pacific coast, has been two years in preparation and is now in full operation. Coal for the 32 ovens is supplied from the Granby's properties at Cassidy, Vancouver island.

* * *

THE Atlas Machine Works, Detroit, recently was incorporated to produce parts for the Detroit Motor Parts Co., 133-135 Larned street, Detroit. The company has purchased equipment valued at $43,000 and is located in a 2-story brick building. No outside work is contemplated at present. E. F. Wilkinson is president and R. B. Merrill, secretary and treasurer.

* * *

THE New Britain Machine Co., New Britain, Conn., has made an offer for the steel government building on its property used during the war for the assembling of big guns, which has caused plans to be halted for dismantling and removing it to the United States arsenal, Watertown, Mass., as intended last week. It is expected the war department will accept the offer, in which event the company probably will use the factory for the building of one-man tractors. This company recently voted to increase its capital stock from $1,500,000 to $2,000,000 for the purpose of building an addition to its plant and making other improvements for the development of its new tractor line.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

INCORPORATED with $325,000 capital, the Mossberg Pressed Steel Corp., Attleboro, Mass., will engage in the metal stamping business and will specialize on products used in the textile, wire and cable industries, manufacturing such articles as spools, reels, beams, beam heads, etc. The company expects to take possession of a large brick building in about a month, which is now being altered. A great amount of equipment has been purchased but it is understood the company is still in need of power presses and some machine tool equipment. Officers of the company are: President, Frank Mossberg; vice president, S. O. Bigney; treasurer, C. A. VanderPyl, and secretary, A. A. Underwood. With the exception of Mr. Bigney, all of the officers were formerly connected with the Frank Mossberg Co., of Attleboro, Mass.

* * *

THE Worcester Machine Screw Co. branch of the Standard Screw Co., Worcester, Mass., is reorganizing its departments, which will necessitate curtailment of production for about two months. Machinery is being shipped to other branches of the company in the East and West and machinery from these plants is being sent to Worcester. Some special lines of production will be attempted at the Worcester plant.

* * *

CAPITALIZED at $20,000, the Stephen Decatur Hausler Co., 280 Broadway, New York, recently was incorporated to represent machinery manufacturers in the New York district. At present the firm represents the Buchalter Tool Co., and the Janos Asbestos Co., both of New York, but is planning to enlarge its representative list. S. D. Hausler is president.

* * *

WHILE a formal list of its machine tool and equipment requirements is not at present prepared, the Chase Tractors Corp., 28 Atlantic avenue, Toronto, Ont., announces it will be in the market for various types of machinery in the near future. It has on hand at present a large number of used machines which are being overhauled and after these are put into service, the company will be able better to determine its exact additional requirements.

* * *

GRAY iron, brass, bronze and aluminum castings will be produced by the Chemung Foundry & Supply Co., Inc., Elmira, N. Y., which was recently incorporated with $50,000 capital. The company is now ordering equipment and expects to begin operations within a few weeks. Its temporary address is 158 Harriet street. Officers are: President, Harry N. Rubin; vice president, J. P. Ward; treasurer, John D. Ward, and secretary, G. L. Siegel.

* * *

FOUNDATIONS for the new plant of the Youngstown Pressed Steel Co., Warren, O., are nearly completed. The framework for the main building paralleling the main line of the Erie railroad is finished and considerable progress is being made in the erection of the structural steel work. Nearby the Pressed Steel Co.'s plant the Supreme Motors Co. has completed a new brick building. Installation of machinery was completed recently and the officials of the company expect to begin operations soon.

* * *

TWO lots have been purchased by the Johnson Auto Signal Co., Vancouver Wash., on which the company plans to erect a 4-story building, 50 x 100 feet. The lower floor of the structure will be devoted to a machine shop and a brass and aluminum foundry. The upper floors will be used for office, assembly and storage rooms. Automobile signals and other automobile accessories are manufactured by the company, of which A. W. Johnson is president and C. A. Bourne, secretary.

* * *

THE Marshall & Huschart Machinery Co., 17 South Jefferson street, Chicago, has added several new lines which it will represent exclusively in the Chicago territory. The additions include the Queen City Machine Tool Co., Cincinnati, cylindrical grinders; Giddings & Lewis Mfg. Co., Fond du Lac, Wis., horizontal boring machines; Hardinge Bros., Inc., Chicago, precision bench lathes, and the Cochrane-Bly Co., Rochester, N. Y., metal sawing machines, filing machines and universal duplex millers and shapers.

* * *

THE Badger-Packard Machinery Co., 133-139 West Water street, Milwaukee, has decided to confine its business to dealing in machinery and transmission supplies, and is discontinuing its machinist supply department, the stock of which has been purchased by the John Pritzlaff Hardware Co., Milwaukee. The Badger-Packard business henceforth will concentrate on iron, steel and wood working machinery, both new and used; motors, electrically-driven tools, and a complete line of power transmission appliances.

* * *

ORGANIZATION of the La Fayette Motors Co. to manufacture passenger cars is announced by Lee Higginson & Co., New York. The company will have an initial capital of $4,000,000 consisting of 40,000 shares of nonvoting cumulative preferred stock, this being part of a total authorized issue of 60,000 shares and 40,000 shares of common stock of no par value. A modern 3-story factory building has been purchased in Indianapolis. The officers of the company are: President, Charles W. Nash, Kenosha, Wis., president of the Nash Motors Co.; chairman, James J. Storrow, Boston; vice presidents, D. McCall White and Earl F. Howard, both of Indianapolis.

* * *

JOHN E. JORDAN, Grafton, Mass., formerly superintendent of the Standard Foundry Co., Worcester, Mass., has purchased the Pero Foundry Co., Worcester, and reopened it after a several months' shutdown due to the molders' strike in that city. The same name will be retained but new officers will be elected. The foundry had been in the Pero family more than 30 years and its retirement will remove the pioneer molders of Worcester from active business life. The company was incorporated in 1904, with $15,000 capital, Prespey Pero being president, Edward Pero vice president and Mrs. Ida G. (Pero) Dolan, treasurer. Mr. Jordan before going to Worcester was located in Indian Orchard, Mass.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

ORA J. FISH, for a number of years second vice president and secretary of the American Shipbuilding Co., Cleveland, resigned at the annual meeting of the company in Jersey City, N. J., on Oct. 9, effective immediately. Both offices will be filled at a subsequent meeting of directors. Other changes in the personnel of the directors of the company were: Resignation of R. L. Ireland as member of the executive committee, Henry S. Pickands, of Pickands, Mather & Co., Cleveland, being named his successor; Samuel Mather, J. H. Wade Jr., and R. G. Mutchins Jr., resigned during the year as directors, their places being taken by G. G. Wade, H. S. Pickands and Herbert P. Powell.

H. H. Outwater has been transferred from Buffalo to the New York office of Rogers, Brown & Co., where he has joined the selling staff.

L. Riese has been placed in charge of the San Francisco office of the Republic Iron & Steel Co., Youngstown, O., recently re-opened in the Reality building.

W. J. Bryan has been appointed sales manager of the Budd Wheel Corp., with offices at 1252 Book building, Detroit.

Samuel E. Stephenson, of the Wellston Steel & Iron Co., Wellston, O., recently was elected president of the Commercial bank, Jackson, O.

Wiley T. Rabon, formerly with the Carolina Machinery Co., Inc., Asheville, N. C., founder and machinist, has become affiliated with the Brenneis Mfg. Co., Oxnard, Cal.

Charles G. Shaffer who resigned his position as superintendent of the Singer Mfg. Co., Elizabeth, N. J., has been made superintendent of the Gillespie Foundry Co., Inc., Paterson, N. J.

Thomas Boyd has resigned as superintendent of the Medina Iron & Brass Co., Medina, N. Y., to become manager of the Crescent Foundry Co., Rochester, N. Y.

Alvin H. Klemme, formerly secretary of the Eagle Foundry Co., Belleville, Ill., has been made factory manager of the Remmert Mfg. Co., that city, maker of locomotive washing machines. He succeeds William Remmert, who takes charge of the sales organization, which duty will necessitate much traveling throughout the country to establish agencies.

Martin Hawk, Manchester, Eng., foreign manager of the Carborundum Co., Niagara Falls, N. Y., having charge of plants in Germany, France and England, is making a visit to the United States.

Fred J. Hartman, of Pittsburgh, has assumed his duties as secretary of the Pennsylvania industrial board, succeeding William Lauder, of Riddlesburg, Pa., who resigned as secretary to serve the board in another capacity.

A. C. Allshul, formerly in charge of the Milwaukee district offices of Joseph T. Ryerson & Son, Chicago, has been transferred to Buffalo, to take charge as branch manager of the warehouse recently acquired by purchase from the Ferguson Steel & Iron Co.

T. Archie Thorn, formerly affiliated with the Harrington-Robinson Co., Boston, now is associated with the Aborn Steel Co., Inc., 22 Clarke street, New York, at its Boston warehouse, 171 High street. He will have charge of an increased stock of high grade tool steel, alloy steel and other steel bars.

C. C. Persiani, for the past four years treasurer of the Clark Bros. Bolt Co., Milldale, Conn., has resigned to become an official of the Pawtucket Mfg. Co., Pawtucket, R. I., maker of bolts, nuts and special machinery. Mr. Persiani had been with the Clark Bros. Bolt Co. for 40 years and before becoming treasurer was superintendent.

Judge E. H. Gary, chairman of the United States Steel Corp., celebrated his seventy-third birthday in Washington on Oct. 8. On that day he attended the sessions of the Supreme Court of the United States, before which arguments are being heard in the dissolution suit against the Steel corporation.

B. H. Reddy has resigned as chief engineer of the National Roll & Foundry Co., Avonmore, Pa., to become associated with the Southern California Iron & Steel Co., Los Angeles, Cal. Mr. Reddy formerly was chief engineer of the National Pressed Steel Co. and designed and constructed the plant of that company at Massillon, O. In addition to his wide experience in steel plants, Mr. Reddy has been identified with iron foundry work, having been at one time superintendent of the Bowler Foundry Co., Cleveland.

E. C. Johnson, former branch manager in Philadelphia for the White Motor Co., Cleveland, and later for the Packard Motor Car Co., Detroit, has returned from overseas, where he served with the motor truck transport corps, and has become general manager of the New York branch of the Standard Steel Car Co., Pittsburgh, which has purchased the interest of the Taylors Motors Corp., and will conduct the New York place as a branch.

Conrad B. Rubery has been appointed works manager for the Sizer Forge Co., Buffalo. For several years, Mr. Rubery was in charge of production at the plant of the Heppenstall Forge & Knife Co., Pittsburgh, but resigned that position early in 1916 to take charge of shell steel production in the United States for the British munition commission. He went to England in December, 1916, where he acted as supervisory forging engineer for the ministry of munitions until the end of the war. W. L. Goodrich, New England representative for the Sizer Forge Co., was able to leave Mercy hospital, Springfield, Mass., on Oct. 1, after an operation for appendicitis. He is fast improving in health and will soon be able to resume his duties.

J. B. Childe, general manager of the Canton spring and forge plants of the Standard Parts Co., Cleveland, has been promoted to take charge as general manager of the Perfection Spring division of the Standard Parts Co. He formerly was general manager of the Hess Spring & Axle Co. and later occupied an official position with the Western Spring & Axle Co. After the latter organization was taken over by the Standard Parts Co. he was placed in charge of the Canton plants. H. E. Clay succeeds Mr. Childe as general manager at Canton. He formerly was plant manager of the Perfection plant, and later became production expert. He recently supervised the construction of the company's new spring plants at Flint and Pontiac, Mich.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

CARL E. EBY, who has been sales manager for the Hyatt Roller Bearing Co., New York City, industrial bearings division, has been appointed to the board of directors of Hyatt, Ltd., a new company formed to market the company's roller bearings in Europe. Mr. Eby's headquarters will be in New York. G. O. Helmstaedter, formerly Chicago district manager, has been promoted to succeed Mr. Eby as sales manager.

Charles C. Ramsdell, vice president of the Gilbert & Barker Mfg. Co., West Springfield, Mass., has returned from a three months' business trip to Europe.

H. F. Himes, formerly connected with the Dimler-Himes Tool Co., Dayton, O., now is manager of the Dayton branch of the Wayne Machinery Co.

C. L. Halladay has been appointed assistant to C. C. Hanch, general manager of the Maxwell Motor Co., Detroit.

W. M. Pattison, president of the W. M. Pattison Supply Co., Cleveland, was elected vice president of the City club, Cleveland, at a meeting of its board of directors, held Oct. 6.

C. Louis Allen, who formerly was president of the Pyrene Mfg. Co., is president of the Allen Corp., New York City, a new company formed to manufacture fire extinguishers.

Theo. T. Lane has been appointed director of purchases for Briscoe & Stahl, Book building, Detroit. The company is purchasing machinery for Bellanger Freres, Neuilly, France.

E. H. Martindale has resigned as sales engineer of the National Carbon Co., Cleveland, to become president and general manager of the Handy Supply & Mfg. Co., that city.

A. W. Frehse, formerly sales engineer of the Detroit Pressed Steel Co., has been appointed chief engineer of the automotive division of the Standard Steel Car Co., Pittsburgh.

H. M. Thomas now is production engineer of the United States Tractor & Machinery Co., Menasha, Wis. For many years he was superintendent of the Anderson Engine Co.

Hercules Smart has been made manager of the Detroit store of the Illinois Tool Works, Chicago, to succeed D. J. Rice. Mr. Smart formerly was manager of the company's New York office.

Albert F. Mellen, who has been laboratory assistant at the Norton Co., Worcester, Mass., has been appointed assistant general manager of the Cleveland branch office of the company.

David F. Edwards has resigned as secretary-treasurer of the Gier Pressed Steel Co., Lansing, Mich., to become an executive of the Duesenberg Motors Co., Elizabeth, N. J.

Robert W. Catlin has been appointed Boston district manager for the Poole Engineering & Machine Co., Baltimore. He has charge of the recently opened branch office in the Old South building, Boston.

William Spaulding Warner, who was chief engineer for the United States Housing Corp., has resigned that position and taken a place on the engineering force of the Stanley Works, New Britain, Conn.

Robert F. Herrick, Milton, Mass., president of the Reed-Prentice Co., Worcester, Mass., is going to Europe shortly with a party of textile manufacturers to investigate textile and general business conditions.

Fred S. Campbell now is in charge of the foundry operated by the Turner Machine Co., Danbury, Conn., having resigned his position as foundry superintendent for the Hitchings Co., Elizabeth, N. J.

Albert E. Coleman, for the past 22 years plant and construction engineer for the Pratt & Whitney Co., Hartford, Conn., has resigned to become vice president of the Bent-Bartlett Co., of that city, general contractor.

E. J. Kearney, secretary and treasurer of the Kearney & Trecker Co., Milwaukee, manufacturer of milling machines, left Sept. 29 for a three-month trip to Europe. Mr. Kearney plans to combine business investigations with sightseeing.

F. F. Coutts has resigned his position as general foundry foreman for the Midwest Engine Co., Indianapolis, and has been made foundry superintendent for the Fulton Iron & Machine Co., St. Louis, maker of diesel engines and cane crushing machinery.

W. N. Brown has been appointed sales engineer for the Joseph L. Skeldon Engineering Co., Cleveland and Toledo, O. His headquarters will be at Cleveland. The company builds complete steam, electric and hydraulic plants.

Walter P. Coghlan has been appointed general sales manager of the American Hammered Piston Ring Co., Baltimore, effective Nov. 1. For the past five years, he has been affiliated with the Klaxon Co., Newark, N. J., in the capacity of secretary and sales manager.

Edward W. Dodge, formerly connected with the Norton Co., Worcester, Mass., has been made general sales manager of the Detroit-Star Grinding Wheel Co., Detroit, recently incorporated to take over the businesses of the Star Corundum Wheel Co., and the Detroit Grinding Wheel Co.

S. E. Weaver, who for several years was manager of the Union Twist Drill Co., in eastern Pennsylvania as well as in the southern territory, has become identified with the sales force of the Davidson Tool Mfg. Corp., 118 Maiden Lane, New York City. He will represent that company in a similar capacity in his old territory.

Charles L. Taylor, a former partner of Andrew Carnegie, president of the Carnegie Hero Fund and vice chairman of the United States Steel and Carnegie Pension Fund, was given the honorary degree of doctor of engineering by the Lehigh university Oct. 4, when the university observed founders' day. Mr. Taylor was graduated from Lehigh university with the class of 1867.

C. L. Goodrich, assistant superintendent of equipment of the Pratt & Whitney Co., Hartford, Conn., will leave soon on a business trip to Chili by way of the Panama canal and down the west coast of South America. B. H. Blood, general manager of the Pratt & Whitney Co., will sail from New York soon on a business mission to England, France, Belgium, Italy and Switzerland. W. R. Tomlinson, works manager, will be in charge during the absence of Mr. Blood.

Agitators Grilled by Senators

Hearing at Pittsburgh Reveals Investigators' Contempt for Union Organizers Who Give Shifty Answers—Leader Formerly Was Employed by Government Employment Service at $250 Monthly—American Workers Express Satisfaction

PITTSBURGH, Oct. 13.—When Jason G. Brown, labor organizer, admitted under questioning by Senator McKellar at Saturday afternoon's session of the hearing held here by the senate committee on education and labor in connection with the steel plant strike, that the organizers and not the men turned down the request for a postponement of the strike until after the industrial conference, the cause of the strikers received a severe jolt. At the same time the belief was strengthened materially that the strike was nothing more than an attempt by the radical element to gain control of the American Federation of Labor.

Brown told of efforts made during the past year by the organizers to hold meetings at various steel plant centers in the Pittsburgh district; of frequent arrests and fines imposed on the labor leaders when they attempted to hold meetings after having been denied permits.

"How many steel employes were in the unions?" asked Senator McKellar. Brown was unable to give a satisfactory answer. "Why is it we can't get the number of employes in the unions?" exclaimed the senator. "It seems impossible to ascertain from any of the organizations how many men are unionized. That is one thing we are trying to discover."

"Do you know whether a good many of those who have gone out have returned to work?" asked Senator Sterling.

"I have heard it in a general way," responded Brown.

"Would you admit that quite a number had gone back?" the senator continued.

"I might say for the sake of argument that there have been," admitted Brown.

Was Employed by Government

Senator Kenyon delved considerably into Brown's earlier career, asking him about his activities in and about Seattle during one or two outbursts of radicalism there. Brown said he had been employed in the government employment service at a monthly salary of $250 until congress failed to pass the appropriation for this service. Before the war, he said, he was president of the international timber workers' union, and he came to Pittsburgh about a year ago to assist in organizing the iron and steel workmen.

Naturalizing Foreigners to Vote

During his testimony Brown attempted an oratorical peroration on American institutions, which "our forefathers in the Revolutionary war, among them mine, fought for."

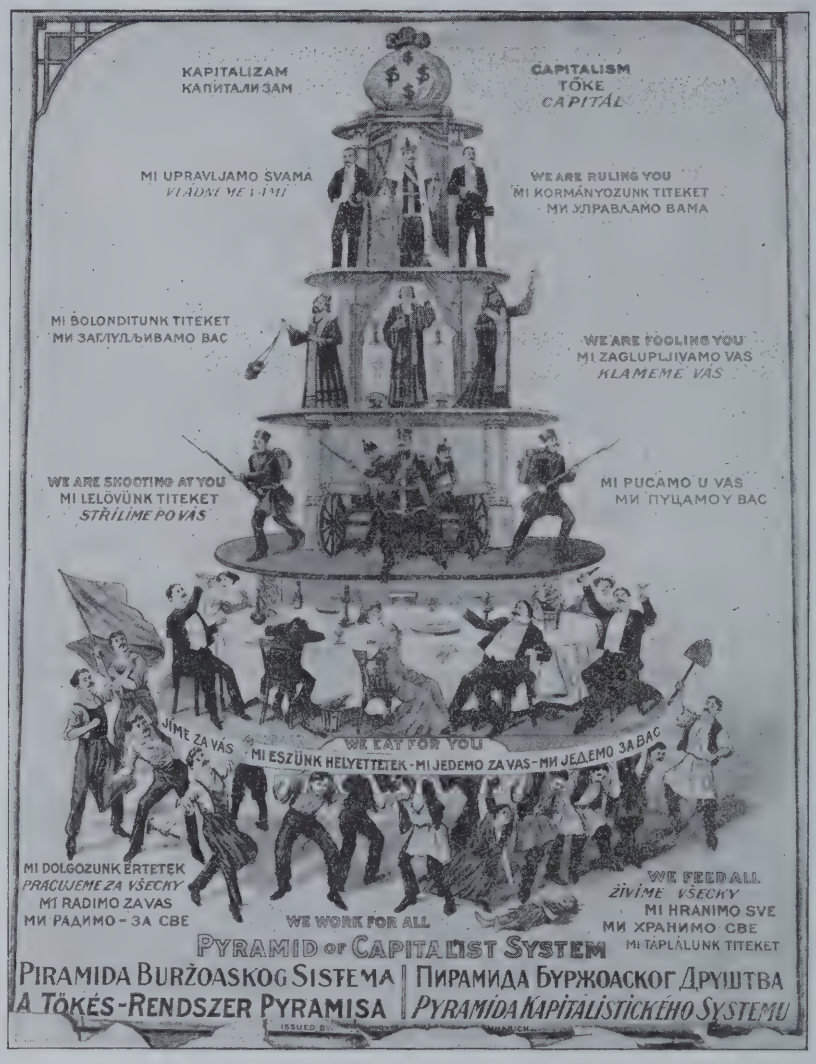
The oratory was a little too much for Senator Sterling, who in a deliberate way addressed the witness: "Mr. Brown, you speak of men whose forefathers established American institutions. Is not the great body of strikers here now composed of men other than those who claim as their forefathers those who fought in the Revolutionary war? Are they not the men who have been persuaded into this strike, and are they not the men on whom you have most depended in holding these meetings to join the strike and for whom you have carried on this campaign? And further, as part of the same question, are not the descendants of the men who fought in the Revolution the men who are staying back and remaining in the mills?"

"That is a hard question to answer," replied the witness. "As to the first part of the question, I will say yes. As to the Americans staying in the mills, I will say in some places it is true and in some places it is not."

"And is it not a matter of fact," pursued the senator, "that the great proportion of foreigners who are out on strike are unnaturalized and are not citizens of the United States?"

"I think a large percentage of them are, but I cannot give them in per cent," said Brown. "We have been trying to get the strikers naturalized, and the reason we are trying to is so we can vote men out of office and put in others to make fairer laws. So we have a selfish reason."

"Then you are not depending upon Americans, but must depend upon getting foreigners naturalized at the earliest possible date to obtain reform?" said Senator Sterling. Brown replied that the people "in this part of the country" are not acting wisely in electing men to office in this way.



Senator McKellar said: "I want to call your attention to the fact that at Clairton yesterday (Friday), when I asked a crowd of perhaps 125 or 150 strikers how many there were who were Americans, or who had become naturalized Americans, and asked them to raise their hands, there were only three who held up their hands. It is a thing which must give us all very great concern."

The witness spoke of the refusal of Judge Gary to confer with strike organizers and said: "The feeling of the organizers was that if they did not get a conference, that if they did not have something to tell the men of some definite achievement, that the thing would go on. The feeling was generally on the part of the organizers that if this strike was not called under the direction of the organization, and thereby some discipline maintained, that it would be called here and there, and the whole thing would fail."

"Then," demanded Senator McKellar, "it was the organization?" "No," said the witness. "It was not the men, was it?" questioned the senator. The witness went into a long and evasive explanation.

Committee Seeks Only the Truth

Senator McKellar interrupted. "Let me call your attention to this fact," he said. "This committee is undertaking to get to the truth of this whole matter—the living truth. It has no ax of any kind to grind. Yesterday (Friday) this committee interviewed quite a body of strikers at Clairton, and I was impressed—I do not know how it struck the other members of the committee—I was convinced that these men were exceedingly reasonable, and that a man like you could have gone to these men and said, 'Here is the President of the United States, the man who is responsible for law and order in our country, the man who is responsible for square dealing in our country, the man who is chief executive of our land; he has asked us to postpone this matter until we can call representatives of capital and labor together, until they can get this matter adjusted to the benefit of all.' A man

Foreign Agitators at Work in America

THE influence of foreign-born radicals among the alien workmen in the United States is shown by the above reproduction of lithographs seized by the authorities in a recent raid on some of the foreigners' homes in Monessen, Pa. In one instance the picture was found on the wall above that of a religious portrait. In addition to the American language four of the leading Slavish tongues are used to describe the meaning of "the pyramid of capitalist system." The pictures were printed in colors and the flag waved by the man at the left of the lower group is red. "We work for all. We feed all," is the caption given the lower group. The leisure class about the banquet board "eat for all." Above, the soldiers say "We are shooting at you." Higher still is the clergy "fooling you," and over them are the rulers, while above all is gold, or capital.

It is a portrayal of the imaginings of the fanatic on sociological problems, but is important to this country in showing how ideas born centuries ago among the downtrodden of Europe and Russia are still fermenting in the United States. The soldiers are of Slavish character; the high church is depicted as a dominating factor, something entirely false in its application to this country. The figures above the churchmen represent foreign royalty—all inapplicable to this country and conditions obtaining here, although with sinister influence on the uneducated and unamericanized.

like you could have told that body, and they would unanimously have approved. The organizers did not tell the men that at any time." The witness answered that they could not have told that to men because they could not hold meetings. Senator McKellar continued: "Didn't you gentlemen who organized these men, especially these foreigners, so many who could not speak our language, didn't you think you were taking a great responsibility to call those men out on a strike or to continue that call, when here was the President, to whom we all owe respect at all times, whoever he may be, when he was asking in the interests of the whole people, not of any class, that the matter be deferred simply until picked men, representing all classes and all organizations of men in our country, could be gotten together and devise ways and means of settling this whole thing?" "It is a difficult thing, Senator; you see, we all look at it from one side," Brown answered. "Here is the President, whom you say is friendly to you," the senator declared. "Yet you turn down that friend. You gentlemen turn down the man who stood by you in order to get even with a man who would not confer with you."

Senators Kenyon, Sterling, Phipps and McKellar arrived here early Friday morning and started on a trip through the Monogahela valley. Opportunity was afforded the senators to visit the plants of the Carnegie Steel Co., at Homestead, Duquesne and Clairton and the National works of the National Tube Co., at McKeesport, the homes of workmen on strike and at work, which John Fitzpatrick had described as hovels, and to interview the men at work and on strike. In an interview as to conditions at the mills, Senator Phipps said that he found the mills at Homestead and McKeesport running normally and those at Clairton, somewhat crippled but showing a good recovery. The men interviewed at the plants expressed themselves as well satisfied with working conditions and wages. Strikers generally gave as reasons for being out that they wanted more money, shorter hours, that they were not being paid for overtime or that they could not live on what they were earning. Few men at work at the plants visited had been asked to join the unions. The senators found plenty of evidence that workmen had been intimated either directly or indirectly through members of their families. Figures were provided the senators as to the operations at the Homestead works of the Carnegie Steel Co., which showed a steady and constant increase in the number of men reporting for work from Sept. 24, when the attendance was 62.1 per cent of the total, up to and including the day of the visit, Oct. 10, when 75.8 per cent of the men reported.

At the Clairton works it was found that 2600 men are now at work.

Steel Earnings Are Improving

Third Quarter's Operations of Lackawanna Steel Co. Results in Recovery From Deficit of Previous Three Months—Improvement in All Steel Lines is Indicated—Good Showing by Other Companies is Suggested

BY JOHN W. HILL, FINANCIAL EDITOR

THE showing of the Lackawanna Steel Co., in its report for the third quarter of the year, the first public exhibit of earnings for the period of any of the large steel companies, indicates the improvement that had taken place in the industry from the close of the June quarter to the beginning of the attempted steel strike on Sept. 22. With earnings of $343,327 for the three months operations ended with Sept. 30 as against a deficit of $233,066 for the previous three months, the Lackawanna company shows a strong recovery. The company was affected to an unusual degree by the rigors of the readjustment period, because of the nature of its output, which is confined largely to heavy steel materials, including rails, merchant bars, structural shapes, plates, etc. Most of these lines have not shared in the recovery that was enjoyed months ago by the lighter products.

During the third quarter, however, improvement in the building construction industry and the beginning of some buying for railroad account is reflected in Lackawanna's earnings. As soon as labor difficulties disappear the company promises to share freely in the expected period of pronounced prosperity. The enormous potential accumulated demand of the railroads, it is indicated, will assure tremendous buying on their part for several years. Some estimates place the needs of the transportation lines at 5,000,000 tons of rails, while rolling stock and equipment of all kinds are in a run down condition and much material will be required to restore them to an efficient basis.

No extensive buying, of course, may be expected from the roads until their future is settled. Director General Hines announces that he is proceeding with plans to turn the roads back to their owners, per schedule, at the first of the year. In the meantime congress is desperately struggling with the problem and seeking a solution that will satisfy all factions—something that is impossible. The bill introduced by Senator Cummins has attracted most conspicuous attention of any of the ideas advanced in congress. The measure has drawn the fire of the labor unions because it contains an antistrike provision.

Congress is faced with the necessity of framing some sort of a plan for the return of the roads within the next two and one-half months and doubtless as soon as the peace treaty is out of the way it will concentrate its attention upon this problem. The railroad brotherhoods are pushing their propaganda for nationalization of the roads but the American public from all manifestations of general opinion is opposed to this proposal.

The showing of the Lackawanna report has aroused speculation respecting the earnings, during the quarter, of the other large companies in the industry. Both the United States Steel Corp. and Republic Iron & Steel Co. reports will appear soon and they are expected to disclose even better improvement than that of Lackawanna.

The stock market continues unshaken in its conviction that the steel industry will win the fight for the open shop and that after the attempted strike has definitely cleared away, the industry will enter into an era of tremendous prosperity. Despite the depressing influence of the exchanges, demands for steel continue to flow in from many parts of the world. Steel common stock has been leading the industrial list on the New York stock exchange in a steady advance for a week and it is evident that the financial community has great faith in the future.

The exchange situation may undergo some improvement as a result of a conference to be held in the East within the next two or three weeks of representatives of the treasury department, the federal reserve board and the department of commerce with leading bankers from the most important business centers of the United States and delegates from Great Britain, France, Italy, Belgium, and possibly other nations of Europe. Remedial measures will be considered at this meeting in an effort to work out some plan for satisfactory regulation of the financial interchanges between nations.

Lackawanna Steel Profits Show Some Gain

Profits of the Lackawanna Steel Co. during the third quarter of 1919 were $343,327, an encouraging exhibit following the deficit of $233,086 during the preceding three months. The best quarter of the year, however, was the first, when net profits reached $1,207,729. None of the three months periods of 1919 compares favorably in point of earnings with 1918 quarters. The September quarter of last year yielded profits of $3,056,286.

For the nine months of the year profits were $1,317,350 as compared with $9,839,102 in the corresponding period in 1918. Unfilled orders on September 30 were 178,981 gross tons as against 451,405 on the same date in 1918, and 122,399 tons on June 30 of this year.

As shown by the accompanying comparative income accounts for the three quarters of this year and the third quarter of 1918 there were variations in the amounts reserved for extinguishment of minerals and depreciation. The high point for mine extinguishment was reached in the third quarter of 1918 with $137,907, while the smallest sum, $45,906, was charged off from earnings in the first quarter of 1919. The comparative income accounts for the three 1919 quarters and third quarter of 1918 follow:

	Third quarter 1919	Second quarter 1919	First quarter 1919	Third quarter 1918
Total net after taxes and other expenses	$1,184,674	$446,757	$1,997,991	$3,935,719
Deduct bond and other interest:				
Lackawanna Steel Co.	228,180	227,667	230,460	233,156
Subsidiary companies	40,675	41,091	41,925	43,020
Balance	915,818	177,997	1,725,667	3,659,542
Less appropriations:				
For extinguishment of minerals	77,094	63,956	45,906	137,907
Depreciation and renewals	495,396	347,127	472,651	465,348
Profit for third quarter	343,327	*233,086	1,207,729	3,056,286

* Deficit.

Machinery Sellers Marking Time

Tendency Among Buyers to Postpone Purchases Until Labor Situation Clears is Marked —Inquiries Are Numerous—Heavy Demand From Automotive and Allied Industries Creeps Eastward—Crane Sales Negligible

CLARIFICATION of the labor atmosphere is the one thing necessary, it is thought to release much pent-up machinery and equipment business. While there has been no decline in the rate of inquiry, particularly throughout the Middle West, numerous orders have been held up because of the steel strike and this has had a discouraging effect upon sellers. As it becomes more apparent, however, that the strike has spent its force, a feeling of optimism is manifest and the trade believes that for the present period of waiting and of quoting on tentative lists, they will shortly be repaid with sizable orders.

Perhaps one of the largest lists on which action is deferred because of the strike is that of the New Departure Mfg. Co., Bristol, Conn., subsidiary of the General Motors Corp. It calls for $1,000,000 worth of equipment. The General corporation too will probably buy some machinery including presses for the plant of the International Arms & Fuse Co., Bloomfield, N. J., after it takes formal possession. These inquiries, with a number of others, tend to show that the demand for tools from the automotive and allied industries so heavy throughout the Middle West for many months, is creeping eastward. The North American Motors Corp., Pottstown, Pa., has a $300,000 list out and the International Motors Corp., Allentown, Pa., has started work on a $1,000,000 expansion. Smaller lists are out from the Parish Mfg. Co., Reading, Pa.; the Willys Corp., Elizabeth, N. J., and a tire concern. This tendency to defer action until the labor cloud lifts is noted in Chicago and Cleveland as well. In the latter city, lists from the Hoffman Heater Co., Lorain, O., and the Youngstown Pressed Steel Co., Youngstown, O., are receiving attention. Nothing definite is obtainable regarding the tool requirements of the projected Cleveland plant of the Fisher Body Corp., Detroit, but since a $10,000,000 plant is planned, they will be large, including many presses. Several smaller inquiries are out for drop hammers, boring mills, etc.

Prices continue their upward trend. It is reported in Chicago that millers have been advanced 10 per cent while a Cincinnati, O., manufacturer of vertical boring mills has increased his price a like amount. In Pittsburgh, prices are almost up to the highest point prevailing during the war. Deliveries continue to be deferred from 8 to 10 weeks and in many cases even further.

Crane awards are at a low ebb. Hubbard & Co., purchased two cranes for its Milwaukee plant. Other purchasers include the Merritt Mfg. Co., Lockport, N. Y., McIntosch & Seymour, Auburn, N. Y., Brewer Drydock Co., Staten Island, N. Y., and M. W. Kellogg & Co., Jersey City, N. J. The latter company will buy several overhead cranes a little later. W. R. Grace & Co., New York City; Richards Mfg. Co., Bloomsburg, Pa.; Turner, Vaughn & Taylor Co., Cuyahoga Falls, O., and the Klein Iron Works, Bellevue, O., all recently made inquiry for prices on cranes.

Demand From Automotive Industry Reaches East

DEMAND for machine tools by the automotive and allied industries, which has been so prevalent throughout the Middle West during the past several months, gradually is being extended to the east. Actual buying has not assumed large proportions so far but sizable inquiries are noted, and others seem not far off as negotiations affecting several important projects in that branch of industry are being consummated.

The largest list current is one involving about $1,000,000 worth of machine tools for the New Departure Mfg. Co., Bristol, Conn., a subsidiary of the General Motors Corp. For some weeks past, the New Departure plants have been undergoing considerable enlargement and some equipment has been purchased from time to time. The present list is by far the largest so far issued. Another large list of equipment, approximately $300,000 worth, is to be purchased by the North American Motors Co., Pottstown, Pa. The North American Co. recently was merged with the Bethlehem Motors Co., Allentown, Pa., which has just been awarded a $10,000,000 contract from England. The International Motors Corp., also of Allentown, Pa., is starting on a $1,000,000 expansion program, which will involve considerable machine tool equipment.

Considerable equipment will be required for the Reading, Pa., plant of the Parish Mfg. Co., which is to be enlarged for the manufacture of heavy automobile frames. The Parish company, with plants in Reading and Detroit, has just been taken over by the Spicer Mfg. Corp., Plainfield, N. J., manufacturer of universal joints and shafts for automobiles, along with the Sheldon Axle & Spring Co., with plants in Wilkes Barre, Pa., and Chicago.

With the taking of formal possession of the plant of the International Arms & Fuse Co., Bloomfield, N. J., by the General Motors Corp. within a few days, heavy machine tool requirements are likely to develop. Much pressing machinery will probably be desired. Another northern New Jersey plant, the Duesenberg plant of the recently organized Willys Corp., at Elizabeth, will be greatly enlarged, thus requiring considerable new machinery for the manufacture of a new 6-cylinder car. "Ludlum" Steels are annealed in six large oil burning furnaces. The steels before being put in these furnaces are placed in large tubes, as shown in illustration. When the tubes will hold no more, the remainder of the space is packed with a special material used by us. The tubes are then placed in the annealing furnace. After annealing, the bars look exactly as though they had been aluminum plated, and are entirely free from scale; and after being straightened, the round bars appear to have been cold rolled, so smooth is the finish.

Prompt shipments from our warehouse stock at Watervliet, N. Y., Detroit, Mich., Chicago, Ill. or Cambridge, Mass., handled through our District Offices.

Lee Tire & Rubber Co., Spring Mills, Pa., expending about $60,000 upon plant expansion, is in the market for a small list of tools.

A Cincinnati manufacturer of vertical boring mills has advanced prices 10 per cent. Increases are in prospect for the near future by other manufacturers of machine tool equipment.

Crane inquiries of the past week include a 7½-ton overhead for export by W. R. Grace & Co., 7 Hanover square, New York City. The Richards Mfg. Co., Bloomsburg, Pa., is in the market for a 10-ton overhead crane, with 50-foot span, Pawling & Harnischfeger have been awarded two 5-ton wall cranes by McIntosh & Seymour, Auburn, N. Y. The 75-ton overhead crane for the Duquesne Light Co., Pittsburgh, recently mentioned, went to the Niles-Bement-Pond Co. The Brewer Drydock Co., Staten Island, N. Y., bought a 10-ton locomotive crane from the Buffalo Hoist & Crane Co., Buffalo. M. W. Kellogg & Co., Jersey City, N. J., has purchased a 15-ton used Ohio locomotive crane from the Industrial Equipment Co., 149 Broadway, New York. The Kellog company later will buy several overhead cranes.

Pittsburgh Market Has Better Tone

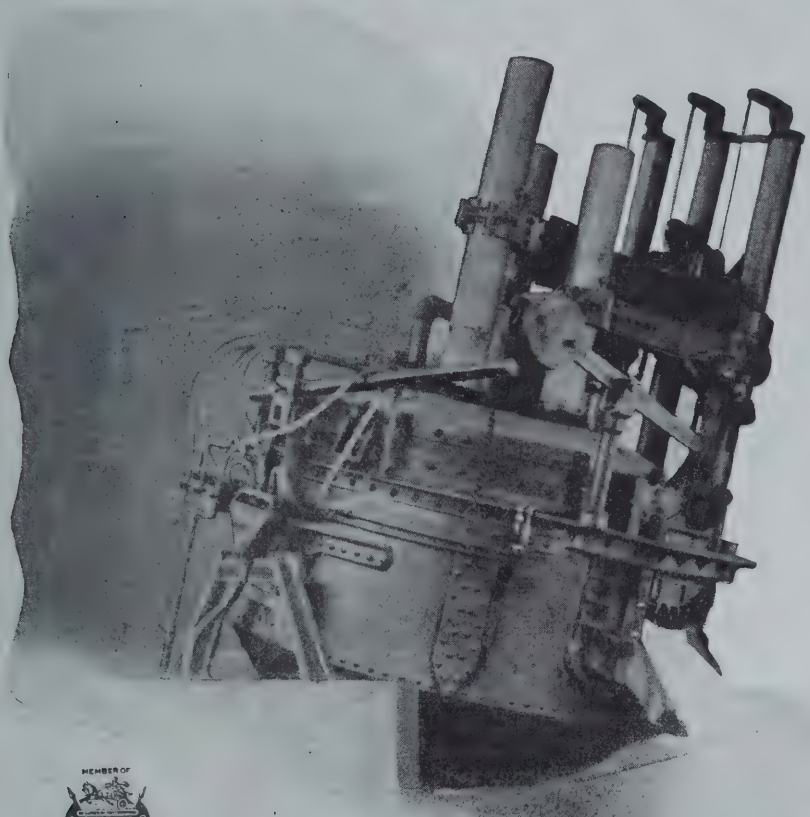
WITH the steel plant strike steadily losing its force and normal conditions gradually being restored in the Pittsburgh district, a more cheerful sentiment is beginning to develop in the machinery and machine tool trade. Orders for cranes, against which inquiries have been out for some time from steel manufacturers, are expected to be closed as soon as the labor atmosphere is cleared. Hubbard & Co. has placed its order for two cranes for its Chicago plant with the Milwaukee Electric Crane Co. One 10-ton and one 5-ton are involved. This company also has taken a 10-ton crane for the Merritt Mfg. Co., Lockport, N. Y., veneering machinery manufacturer. Fair demands are being made upon the makers of lighter equipment, but no big lists have come out lately. Makers are well booked and are quoting prices only slightly below the war quotations and not guaranteeing deliveries short of eight and 10 weeks.

Large Order Held Up by Strike

WHILE demand for machine tools continues excellent in the Chicago market, some effects of the steel strike are being noted and in several cases business is being held up until it is settled. One instance has come to note in this city where a large manufacturing concern has deferred buying considerable equipment because the contract calling for an addition to its plant is delayed until the strike is ended. It is believed the order for the machinery will come through as soon as the steel strike is over. A general advance of 10 per cent has been made on millers. Deliveries are becoming more advanced and as a rule 60 to 90 days are required on most lines.

The Samson Tractor Co., Janesville, Wis., division of the General Motors Corp., is buying its equipment in small lots instead of putting out an inquiry for its entire requirements at one time. The Nash Motors Co. is preparing to issue a list of the equipment needed for its new Milwaukee plant, which will be heavy. A new manufacturer of refrigerator machinery has obtained space for its manufacturing operations and is about ready to buy its machinery.

Tool Orders Withheld; Inquiries Are Numerous



DEFERRED action upon needed machine tools because of the steel strike is the chief concern of the moment with sellers of equipment in the Cleveland market. Many companies which have perfected their building plans now are blocked by the element of uncertainty in the labor market and are postponing their machinery purchases accordingly. With the end of the strike in sight, however, much business is expected to be closed shortly. Sizable lists are issued by the Hoffman Heater Co., Lorain, O., which is erecting a plant, 96 x 300 feet, costing $40,000, and the Youngstown Pressed Steel Co.,

Machinery Exports for August Show Further Reduction

UNSTABILIZED exchange further is reflected in the continued decline of machine tool and machinery exports from the United States. In June, these aggregated $8,606,565; in July, $4,440,819, and from the statistics just issued by the bureau of foreign and domestic commerce, the total for August shows another reduction of $591,676 to $3,849,143. England maintains her position in the van of the other countries, with $971,844, as against $1,475,698 in July. France still is second with $785,558 as compared with $1,130,486 the preceding month. Japan has come up from eighth place in July, with $86,437, to third in August, with $432,387, that place having been held by Belgium in July. Belgium takes fifth place in August with $242,701, fourth being held by Canada with $387,322. Detailed figures follow:

	Lathes		Other Machine Tools		Sharpening and Grinding Machines		All other Metalworking Machinery		Total	
	August	July	August	July	August	July	August	July	August	July

STAFF

Say you saw it in THE IRON TRADE REVIEW

Youngstown O. which is building a $600,000 plant at Niles, O., 520 x 560 feet. The Ohio Machine & Tool Co., Kenton, O., will require a few tools for its machine shop addition and the S. Flory Mfg. Co., Bangor, Pa., requires a number of tools. The Torbensen Axle Co., Cleveland, still is in the market and is receiving quotations on drill presses. The Mossberg Pressed Steel Corp., Box 66, Attleboro, Mass., wants some power presses as well as a number of machine tools. It is understood that the McMyler-Interstate Co., Bedford, O., is getting ready to issue a sizable list of miscellaneous equipment. Some dealers are quoting on the $300,000 list issued by the North American Motors Co., Pottstown, Pa.

One interesting phase of the present day machinery market in the Middle West is the preponderance of small size inquiries. These continue to be received at a brisk rate and mainly call for one or two machines. The Fox Furnace Co., Elyria, O., wants a 36 x 36-inch x 12-foot planer. The Electric Steel & Forge Co., Cleveland, is taking quotations on 2500 and 3000-pound steam drop hammers. A 1500-pound drop hammer is sought by the Adams Axle Co., Findlay, O. Radial drills are wanted by the Wagner Steam Pump Co., Canton, O., and the National Radiator Co., Johnstown, Pa. A 4-foot radial is desired by the Bovaird Co., Bradford, Pa. The Columbus Heating & Ventilating Co., Columbus, O., wants a 25-inch lathe while the Steiner Mfg. Works, Erie, Pa., desires a 20-inch. The J. H. Miner Saw Works, Lumberton, Miss., wants a used 36-inch drilling machine. The Anderson Rolled Gear Co., Cleveland, is endeavoring to obtain a 42-inch Bullard boring mill and a used mill of the same size and type is desired by the Ohio Register Co., Wadsworth, O. A 60-inch boring mill is wanted by Shartle Bros. Machine Co., Middletown, O. O. E. Brown, 718 North Lawndale avenue, Chicago, wants 15 and 6-inch gear generators while a keyseater is sought by Arnold Creager Co., New London, O. R. L. Graham, Wiarton, Ont., wants woodworking machinery for his new plant.

While sales of tools have not been numerous or large, some bookings are reported. Most of these continue to come from the automotive industries. The Bean Spring & Mfg. Co., Massillon, O., organized recently with $500,000 capital, has closed on its machinery requirements to produce automobile springs and accessories. Several large items of machine tools and other shop equipment have been purchased by the Murray-Mylrea Co., Antigo, Wis., founder and machinist. The purchase includes a 36 x 48-inch x 10-foot planer and a 6-foot lathe. An order for 60 drills recently was booked by this company and now is being filled. The Packard Motor Car Co., Detroit, building a machine shop; the Hupp Motor Car Co., that city, erecting a plant addition; and the Cadillac Motor Car Co., also of that city, putting up a new plant, all have been recent purchasers of machinery in Cleveland, Detroit and elsewhere.

Much crane business is being held up by the strike. Inquiries for locomotive cranes, however, are fairly numerous, and a few awards recently have been made. Turner, Vaughn & Taylor Co., Cuyahoga Falls, O., is in the market for a 15 or 20-ton locomotive crane. The Klein Iron Works, Bellevue, O., also desires quotations on traveling cranes. T. L. Church, chairman of the board of control, Toronto, Ont., wants a cantilever crane.

As formally announced last week the Fisher Body Corp., Detroit, is forming an Ohio corporation for the purpose of building a $10,000,000 plant in Cleveland. No definite news regarding the machine tool equipment is obtainable, but a large number of presses, machine tools, etc., will be purchased. Dies, fixtures, etc., are being made at Detroit.

The project at Toledo, O., to be engineered by A. Bentley & Sons, and thought by some to be a shipyard, still is in abeyance. For it a huge tentative list of machine tool requirements was issued two or three weeks ago. It is understood that $1,000,000 capital already has been promised contingent upon the contract for the work being obtained by the Bentley company.

Other projects which now are before machinery sellers as promising outlets for their products include: A plant for the Milholland Machine Co., Indianapolis, recently incorporated at $1,200,000; new buildings for the Bridgeport Machine Co., Bridgeport, O., and the Cameron Tool Co., Moundsville, W. Va.; a factory for the Wheeler Transmission Co., Indianapolis; an engine manufacturing plant for the Chief Motor Co., Port Huron, Mich. to be erected on 10 acres purchased a few days ago; a 4-story plant for the Landis Machine Co., St. Louis, which will cost $245,000. A fire recently damaged the machine shop of the American Car & Foundry Co., Terre Haute, Ind., and it is thought that much equipment will have to be replaced. The James Holan Mfg. Co., and its subsidiary, the Holan Metal Products Co., Cleveland, are increasing their manufacturing facilities.

HOLYOKE, MASS.—Plans are being drawn for a machine shop, two stories, 100 x 200 feet, for the

Van Dorn Iron Works Co.

Kreodone EVERLASTING WOOD BLOCK FLOORS

THERE'S nothing gentle about a dig from the lugs on the flat "feet" of a baby tank.

Talk about your "toe-holds." There's no comparison.

And think of the tremendous weight resting on these narrow lugs, sufficient to crumble up any floor but a KREODONE Wood Block Floor. It stands the "gaff"—and likes it. See the excellent condition of this floor in spite of it?

The reason?

KREODONE floor blocks are of selected long leaf yellow pine, treated with our special, PURE—*mark the word*—creosote oil, which not only preserves the blocks indefinitely but makes them free from the very common, sticky, tarry smudge and other adulterations.

Specify KREODONE floors in your contracts. They stand the severest wear and give the aggressive service which results in the greatest economy and durability.

Write our Engineering Dept. for FREE analysis and specifications on any space you want to cover—also our illustrated KREODONE Catalog.

Get the *Genuine KREODONE* Blocks
Watch that Spelling—it means Service

SAN FRANCISCO, CAL.—The J. Hendy Iron Works, 75 Fremont street, is having plans prepared for a plant to cost $400,000.

Business Changes Recently Announced

THE office of President A. C. Dinkey of the Midvale Steel & Ordnance Co. hereafter is to be located at the executive headquarters of the company at 14 Wall street, New York City. Chairman W. E. Corey and Secretary W. B. Dickson in the past have been at the Wall street address and Mr. Dinkey in connection with the general sales office in the Widener building, Philadelphia. Some of the officials now stationed at Johnstown are to take up their quarters in Philadelphia.

The Merrill Iron Works, Merrill, Wis., has changed its name to the Merrill Machinery & Supply Co., with F. E. Taylor continuing as president and active manager.

* * *

The Morton Machinery Co., Philadelphia, has removed to enlarged quarters at 139 North Third street.

* * *

The Curran-Detroit Radiator Co., Detroit, has moved into a new plant at Lafayette boulevard and Vermont street. The company makes automotive engine radiators.

* * *

Arthur G. McKee & Co., Cleveland, engineers and contractors, removed their principal office to 2422 Euclid avenue, that city, on Oct. 15.

* * *

The Universal Rolling Mill Co., with plants at Bridgeville and Charleroi, Pa., recently changed its name to the Universal Steel Co. This company manufactures tool and alloy steel.

Effective Oct. 15, the offices of the Cromwell Steel Co., Lorain, O., whose reorganization was noted on page 968 of the Oct. 9 issue of THE IRON TRADE REVIEW, are located on the third floor of the Sincere building, East Fourth street and Prospect avenue, Cleveland.

* * *

The San Francisco office of the Republic Iron & Steel Co., Youngstown, O., has been reopened in the Reality building with L. Riese in charge.

* * *

The name of the B. F. Biggs Pump Co., Lafayette, Ind., has been changed to the Biggs Pump & Supply Co., without change in ownership or policy.

* * *

The Erie Iron & Steel Co., Erie, Pa., announces the removal of its branch offices from its previous quarters in the Real Estate Trust building to new quarters at 1002 Land Title building, Philadelphia.

Link-Belt Cranes in France

JUST as Link-Belt Locomotive Cranes have served our country speedily unloading cargoes from the transports on the docks at France, so can they serve you.

For handling heavy materials; for storing coal; for storing and rehandling clinker, handling iron and steel, or switching cars, the Link-Belt Locomotive Crane is a useful and profitable machine around the yard. When not in use for the specific purposes for which it is purchased you will find there is always some other profitable work for such a machine to do.

We have developed out of years of experience a vast fund of knowledge about the handling of materials, which we shall be pleased to place at your disposal.

New Trade Publications

DECARBONIZING OUTFIT.—A small 4-page leaflet has been published by the Davis-Bournonville Co., Jersey City, N. J., describing an outfit for burning out carbon deposits in gas engine cylinders.

SAND BLAST EQUIPMENT.—A 28-page booklet devoted to sand blast equipment, is being circulated by the American Foundry Equipment Co., New York. The equipment described, includes rotary table rooms, automatic tables, revolving barrels, blast cabinets, pressure tanks, dust arresters and accessory equipment. Each is fully described and illustrated.

ROCK CRUSHING PLANT.—The Allis-Chalmers Mfg. Co., Milwaukee, recently published bulletin No. 1411, which is a 45-page illustrated booklet, containing a description and illustrations of a modern rock crushing plant. Various data pertaining to the parts of the crusher are given and the latter part of the booklet contains a number of line drawings of actual crushing and screening plant installations.

CORE OVENS.—The Ohio Blower Co., Cleveland, has published an 8-page bulletin, in which core ovens, core cars and racks and rotary ballbearing ventilators are described and illustrated. Complete data are given concerning each product and numerous illustrations, showing typical installations, etc., supplement the descriptions. A temperature chart taken on one of these ovens, is given as a supplement to the booklet.

CONTRACTORS TOOLS.—A 40-page illustrated booklet has been issued by the Warren Tool & Forge Co., Warren, O., in which a line of contractors and railroad tools, such as picks, hammers, hoes, crow bars, etc., are described and illustrated. Detailed tables on the weights and measurements of the tools are given. Where possible, both the metric and English systems are used, and complete transposition tables of both systems are presented on the last page of the booklet.

DUST COLLECTOR.—Bulletin No. 1454, issued by the Allis-Chalmers Mfg. Co., Milwaukee, is devoted to describing and illustrating a dust collector, which the company manufactures. The machine is of the bag filter type and according to the bulletin, the collecting of dust is accomplished by filtering the air or fumes through cloth bags of special weave, which are automatically cleaned, discharging the residue into a hopper at the bottom of the machine. The collector consists of a number of annular compartments, each containing 12 bags. The operation of the dust collector, as well as its construction, capacity, horsepower requirements, maintenance, etc., is outlined in the booklet.

RADIAL DRILL.—A 4-page leaflet in which a radial drill is described and illustrated is being distributed by the Silver Mfg. Co., Salem, O. The base of this machine is strongly ribbed both lengthwise and crosswise. An oil channel is cast all around which drains into a reservoir under the column, which is of semisteel. Eight changes of feed are provided as well as depth gage and automatic feed trip for drilling to a predetermined depth. The tapping attachment, with which the drill is equipped, is of the expanding ring type. Steel gears are used throughout as are bronze bearings. Other data, including specifications, are given and illustrations show the various parts of the machine.

ELEVATORS.—A loose-leaf booklet has been published by the Warner Elevator Mfg. Co., Cincinnati, in which parts of freight elevators, which it manufactures, are described and illustrated. The traction engines, with which these elevators are operated, are of the direct-connected type. The motor, worm gear, brake and traction sheave are mounted on a heavy cast iron bed plate; all parts are interchangeable; the worm wheel, according to the booklet, is hobbed from a solid blank of phosphor bronze and is bolted to a cast iron spider; the worm and worm shaft are machined from a solid forging of high carbon steel. the ball thrust bearing is mounted on the end of the worm shaft and the brake is applied by a heavy spiral spring. Other parts of the engine are described, as well as four types of motors and three types of cars. One page of the booklet is devoted to a description of a direct-current controller.

WIRE CHAINS.—An elaborate cardboard covered booklet, of 112 pages, in which weldless wire chain and accessories are described and illustrated, is being distributed by the Chain Products Co., Cleveland. This is the seventh chain catalog issued by the company and is known as catalog C 30. In its composition an effort has been made to present the various products in a comprehensive manner and to this end, the booklet has been divided into three sections, namely: Coil chain, chain specialties and miscellaneous attachments. Each individual size is listed separately. The constructon and other data pertaining to the various chain are given, as well as the various uses to which they are put. Border decorations add to the appearance of the booklet.

PANEL BOARDS.—Bulletin No. 47942, devoted to a description of safety panel boards and cabinets, is being distributed by the Sprague Electric Works of the General Electric Co., New York. These panel boards are applicable wherever the live front type of panel board has been used. Branch circuit switches and main switches are said to be distinctive features. They are of simple design and are positive in action. The blades of the branch circuit switches make direct contact with the branch connection bars, and the brushes of the main switches make direct connection with the main buses, providing the minimum number of electrical joints. The booklet is replete with specifications and other data. A number of illustrations are given.

UNDER-FEED STOKER.—A 16-page booklet in which an automatic under-feed stoker is described and illustrated, recently was published by the Universal Automatic Under-Feed Stoker Co., Johnstown, Pa. The booklet explains in simple language the operation, etc., of the stoker, and this non-technical description, which is a deviation from the usual descriptions of similar appliances, will enable the average person to understand the workings of the equipment in a clear sense. The stoker may be applied to any kind of furnace, including not only all types of water tube, fire tube and various marine boilers, but also metallurgical furnaces for heating or melting ferrous and nonferrous metals, kilns, dryers, etc. A number of illustrations supplement the description.

CYLINDER TEST GAGE.—A 4-page bulletin in which a test gage for detecting the variations in cylinder diameter, is described and illustrated, is being circulated by the Federal Products Corp., Providence, R. I. According to the folder the gage feelers when inserted in the cylinder bear at their inner ends, by means of spiral springs, against a cone cam which is connected by a steel rod through an outer casing to a rack and spur movement operating a gage dial. A lever is also attached to the steel rod by means of which the cone cam is lowered, permitting the feelers to recede sufficiently to be inserted in the cylinder. Once inside the feelers are automatically released against the inner sides of the cylinder. Other details of the gage are given as well as a number of illustrations.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

An agency on a commission basis is desired by an engineer in Spain for the sale of rails, ties, screws, angle plates, tubular steel posts, and wheels and tires for railroad coaches and freight cars. Opportunity No. 30845.

A merchant in France desires an agency on a commission basis for the sale of cutlery, hardware and household utensils. Correspondence should be in French. Opportunity No. 30848.

The electrical commissioners of a city in Australia desire quotations and full information on boiler house machinery, coal and ash handling equipment, coal mining machinery, turbogenerators, condensing plants, electrical storage batteries, machine tools, traveling cranes, electrical instruments, and similar equipment. Opportunity No. 30856.

A commercial agent from Egypt, now in this country, desires an agency for the sale in Egypt and Syria of agricultural machinery, machine tools, etc. Opportuity No. 30857.

The president of an American trading corporation will sail to the Balkans shortly, and desires agencies for the sale of automobiles, motor boats, motors, agricultural machinery, machinists' tools, etc. Opportunity No. 30858.

The purchase of cement-making machinery is desired by a party in Roumania. Correspondence should be in French. Opportunity No. 30860.

A firm in Norway desires to purchase kitchen utensils and equipment. Opportunity No. 30861.

A merchant in Algeria desires to purchase safes, office furniture, typewriters, etc. Correspondence should be in French. Opportunity No. 30865.

A manufacturer in French West Africa desires to purchase butchers' tools and machinery. Correspondence should be in French. Opportunity No. 30866.

An agency is desired by a firm in Roumania for the sale of agricultural machinery. Catalogs and price lists are requested. Correspondence should be in French. Opportunity No. 30867.

The representative of a firm in Australia is in this country and desires an agency for the sale of hardware, tools, emery wheels, grinders, etc. Opportunity No. 30868.

An official of a navigation company in Roumania desires to purchase steel plates for shipbuilding purposes, chains, anchors, etc. Correspondence should be in French. Opportunity No. 30871.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, October 23, 1919 *No. 17*

Shortages Bring Price Advances

Market Effects of Strike Registered in Sharp Rise of Pig Iron, Scrap and Certain Mill Products—Plant Operations Continue to Improve But General Output is Still Much Below Normal

LOSS of production with a consequent shortage of material, caused by the strike, has created a situation where consumers are bidding up iron and steel prices rapidly in their efforts to protect themselves against their requirements. The impending coal strike with its threat of a further far-reaching dislocation of industry, is serving both to intensify this insistent demand and to raise the prospect before the producers of higher operating costs. Material available for early delivery freely is commanding sharp premiums and this is tending also to lift prices for future shipments. The most pronounced advances have been in pig iron, semifinished material and certain grades of scrap. The finished steel market is being steadied by the continued willingness of producers to accept business at the levels prevailing before the strike, though the influence of this is offset in some degree because of the uncertainty of deliveries. Likewise buyers do not hesitate to offer advances for material in sight or of assured shipment. Further restrictions placed on car supply by the railroad administration to speed up coal traffic is a new factor in the present situation.

Iron Advance is Swift

Pig iron has shown the most impetuous action. In virtually all districts there has been a quick upward move of $2 to $3 per ton both for shipment this year or through the first half. Buffalo foundry iron has been sold in considerable tonnage at $29 to $30 for the base grade, at $29.50 for malleable, at $31 to $32 for No. 2X, while high silicon has brought as high as $34; Cleveland foundry at $29 to $30 and $29.50 for malleable; eastern Pennsylvania base grade at $31 to $32 and No. 2X at $32 to $33; Alabama No. 2 at $29; and Virginia at $30 and higher. The Chicago market is up $2 and the minimum of valley No. 2 is $28 to $29. Steelmaking grades still fail to reflect any decided change, although the recent purchases of the Steel corporation now placed at 100,000 tons or more, have absorbed much of the free iron of this character. St. Louis steelmakers have placed 25,000 tons of basic at Chicago for first half.

Mill Prices Are Higher

Sheet bars have been sold $3 higher at $45, Pittsburgh. Eastern makers of semifinished steel have advanced rerolling and forging billets $5 and sheet bars $2.50, and report sales of billets on the higher basis. Sales also have been closed at $40.50, Pittsburgh, a $2 advance. The Bethlehem Steel Co. has advanced steel bars $3 per ton to 2.50c, Pittsburgh. Premiums are being offered by consumers on steel bars for prompt shipment. Plates are strong at 2.65c, Pittsburgh. Sales of 8700 tons of bar iron have been closed to northern Pennsylvania oil interests as a substitute for steel bars at approximately the equivalent of 2.75c Pittsburgh. Cast iron pipe in the South is up $3 to $5.

Output is Gaining

Operating conditions continue to improve steadily. The men are returning to work in all districts but the movement is exceedingly slow in some cases, notably at Cleveland, though there has been a considerable increase in production there and two blast furnaces have been started; the situation in the Mahoning valley is much better. At the Youngstown works of the Carnegie Steel Co., 90 per cent of the American-born employes are at work. Independent mills in Youngstown territory have several blast furnaces, and numerous open-hearth furnaces and mills in commission. An effort of the agitators to carry the strike to the Lake Superior ore regions has resulted in failure.

Export prices also are working higher. Sellers have anticipated in their quotations an advance of $5 in wire products. Wire nails for export are at $4, Pittsburgh, against the domestic price of $3.25 to $3.50. An order for 8500 kegs for Japan at the higher price was declined. A Pittsburgh maker accepted about 50,000 boxes of tin plate of an inquiry for 100,000 boxes at $7, Pittsburgh. An inquiry for 41,900 tons of billets for Belgium has attracted attention. Belgium and Holland have been recent buyers of 10,000 to 12,000 tons of spiegeleisen around $35, f.o.b. New York. Japan placed 3000 tons of structural shapes.

Strike Dictates the Market

STRIKE conditions have produced a fundamental change in the iron and steel market. The fourth week of the walkout finds a number of the plants still crippled and in one or two cases in idleness, others working at part capacity and a considerable number back at about the stage of activities which prevailed when the trouble began, Sept. 22. Absence of the men from their posts and the lapse of efficiency due to the upset operations have resulted in a large loss of production and this total is being increased daily. It is this loss of production which has created a new underlying basis of trading conditions, which is having a very apparent effect upon the market. This situation is being intensified by the fact that while operations generally are working back to their level of Sept. 22, the progress necessarily is gradual and the complete restoration of a tonnage output equal to that period promises to be delayed.

When the strike outbreak came the iron and steel industry generally was pursuing the policy of discouraging price advances although a condition of supply and demand existed in numerous products which warranted higher quotations. This attitude of iron and steel producers of opposing advances was in support of the general movement aimed at bringing down the high cost of living. New factors accountable wholly to the strike, now have tended to put the situation beyond the influence of any conservative selling policy. With production lowered by the interruptions of plant operation and consumption maintained at a high point and still expanding, an acute shortage of steel has been produced and is continuing. Buyers shut off from their regular sources of supply have been combing the market for available material, in order to sustain their own operations, and they have been bidding up prices without hesitation. Furthermore, there has been a disposition on various sides which has been aggravated by the threatened coal strike to prepare for future eventualities by adding to current stocks wherever possible. Prices consequently are moving up rapidly in pig iron and in certain forms of steel where the dislocation of supply has been the most pronounced. Some producers of finished steel still are willing to quote former prices for new orders. These largely are nominal, however, because of the uncertainty of the delivery. The steadying influence of such quotations accordingly is minimized. Material available for prompt or early shipment is making its own price, and this higher figure for the time being is constituting the real market.

The present market situation in iron and steel is a striking illustration of the economic wastefulness and loss involved in the indiscriminate use of the strike weapon. The manufacturers are losing profits, the men are losing wages and the consumers are adding to their costs. In the end the bill comes back to the public for settlement, but the whole country will have sustained an irretrievable loss. In this light, a strike so unjustified in truth and reason as the steel strike or the threatened suspension of the coal mines, becomes a plain economic crime.

Let Trade Guilt be Defined

ANYTHING which smacks of uncertainty has a directly adverse effect upon business, and, by affecting the prosperity of the country, reacts upon the public. There constantly exist many factors of uncertainty which cannot be removed except by the passage of time. But there are others which can and should be removed. One of these factors is the uncertainty as to the status of big business combinations with respect to our so-called antitrust laws. These comprise the Sherman act of 1890, the federal trade commission act of 1914, the Webb-Pomerene act of 1914, and certain provisions of the revenue laws of 1894 and 1913. But the basis for all of these laws is the Sherman act itself.

When the senate passed the Sherman act it was in the belief that the courts never would hold that it prohibited the lawful and harmless combinations which previously had been permitted in this country without complaint. But the Sherman act was far from a

perfect instrument and it took the supreme court of the nation 21 years to adopt this reasonable attitude in its construction of the law. The decisions which already have been made under the Sherman act make one thing plain, namely, that it is illegal for any corporation to operate in restraint of trade. But they also show that there is no guarantee from possible constructions of the law, as to what may constitute guilt. In fact, all big business interests, excepting those already dealt with under the Sherman law, exist with doubts as to their legal status.

In view of the unsatisfactory character of the existing antitrust laws, it is significant to note that there now is before congress a bill which calls for the creation of a commission which shall decide beforehand whether a corporation, upon organization, is proceeding in accordance with the law, or whether any of its acts are opposed to the decisions of the supreme court. This bill, of which Representative Henry J. Steele, of Pennsylvania, a corporation attorney, is the author, is based on the fact that there now is no certainty as to what constitutes a monopoly, or illegality. It therefore is proposed that there shall be established a body to which honest men may repair for guidance and a clean bill of health.

Clearly, the prosperity of a great industrial country such as the United States must depend in large measure upon its large corporations. Such interests lower the cost of production, improve the condition of the worker, make possible national participation in the markets of the world, and promote general stability. The country needs them and cannot afford to handicap them with needless uncertainties. A law such as that proposed by Representative Steele would do much to eliminate the greatest uncertainty of all.

Solving Refractory Problems

IN AN article dealing with the effect of heat on refractories, published elsewhere in this issue, reference is made to a series of tests recently developed in an attempt to solve some of the many problems associated with the use of clay and silica brick. These tests are of importance to the iron and steel industry in that they clear up to a considerable extent the reasons for the wide variation in the performance of refractory brick. For instance, they help to explain why the life of a blast furnace lining varies from two to seven years; basic open-hearth roofs from 25 to 400 heats; soaking pits from six to 18 months; converter bottoms from four to 16 heats and ladle linings from four to 25 heats. The tests also shed light upon the phenomenon of one brick in a blast furnace lining remaining solid while those around it disintegrate.

Results of many tests of commercial silica brick show the crushing strength falls off from 50 to 60 per cent in heating the brick from room temperature to 1350 degrees Cent. Brick defective because of fire cracks loses 46.4 per cent of its weight when subjected to a spalling test at 540 degrees Cent., while brick without fire cracks loses only 26.3 per cent. Other tests of the series indicate that the finer the grind of the brick the greater is the loss from spalling. They also show that the performance of clay brick is similar to that of silica brick in many ways.

These tests, as well as many investigations which have been made, serve to clarify the problems of refractories and to pave the way for more intelligent co-operation between consumers and producers. Inasmuch as this co-operation is so important and so urgently needed, it is extremely gratifying to know that the research work, which always must form the basis for co-operative effort, is making headway.

Organized Labor on Trial

ORGANIZED labor is carrying a tremendous responsibility in the present steel strike, one which will leave its mark for many years and may seriously set back the general cause of unionism in this country. This is the accepted presence within its ranks of radical and ultra-radical interests which in recent years have desisted from fighting organized labor and have adopted a policy of infiltration, burrowing within, like a worm.

Whether or not the rank and file and the conservative leaders of unionized workers have realized this fact it cannot be escaped. The existence of a strong party within the ranks of labor seeking to use the machinery already at hand to further the destructive propaganda, is being brought out so clearly that the general public has seen and grasped the imminence of this danger.

This was the real cause of federal troops taking charge in Gary, Ind., and neighboring industrial cities. Maj. Gen. Leonard Wood outlined the situation as follows:

"The gravity of the situation in Gary is found in the presence of a dangerous and extremely active group of I. W. W. and anarchistic elements which are striving to bring about extensive disturbances against law and order. These elements are working against everything which this country stands for."

The work of federal secret service men has resulted in many arrests and the seizure of large quantities of radical literature. Whether organized labor is in sympathy with these extreme methods or in opposition to their objects counts for little in the last analysis, since the public will not tolerate any organization which is the haven, even unwittingly, for such groups and allows them to work along the lines already uncovered at Gary. Organized labor must purge itself of this deadly contamination before it goes before the people to ask favors or rights or even consideration.

Iron and Steel Prices

Corrected to Wednesday Noon

SCRAP, WAREHOUSE, ORE AND OTHER PRICES ON PAGES 1152 AND 1154

Pig Iron

Bessemer, valley	$27.95
Bessemer, Pittsburgh	29.35
Basic, valley	25.75
Basic, Pittsburgh	27.15
Basic, delivered, eastern Pa.	28.00
Basic, Buffalo, furnace	26.75
Malleable, Pittsburgh	29.90 to 30.90
Malleable, Chicago, furnace	29.25
Malleable, Buffalo, furnace	27.25 to 29.50
Malleable, delivered eastern Pa.	33.10 to 33.60

FOUNDRY IRON SILICONS

No. 2 Northern	1.75 to 2.25
No. 2 Southern foundry	1.75 to 2.25
No. 2X Eastern and Virginia	2.25 to 2.75
No. 1X Eastern	2.75 and up
No. 1 Chicago	2.25 to 2.75
No. 2 foundry Eastern	1.75 to 2.25

No. 1X, eastern delivered Phila.	$34.10 to 35.10
No. 1 foundry, Chicago furnace	30.00
No. 2 foundry, valley, Pittsburgh	29.40 to 30.40
No. 2 foundry, Buffalo	29.00 to 31.00
No. 2 Northern, Boston	33.90 to 34.90
No. 2 foundry, Cleveland furnace	29.00 to 30.00
No. 2 foundry, Ironton furnace	29.75
No. 2 foundry, Chicago furnace	28.75
No. 2X, eastern del., Phila.	33.10 to 34.10
No. 2X, eastern, N. J. tidewater	33.10 to 34.10
No. 2X, eastern, Boston	35.90 to 37.90
No. 2X foundry, Buffalo furnace	30.00 to 32.00
No. 2 foundry, del., Philadelphia	32.10 to 33.10
No. 2 foundry, N. J. tidewater	32.10 to 33.10

Pig Iron Prices Advance Rapidly

Market Shows General Upward Move of $2 to $3 as Supplies Become More Restricted—Liberal Tonnage Being Closed on Higher Basis—St. Louis Steelmaker Buys 25,000 Tons of Basic at Chicago

Chicago, Oct. 21.—After having held steadily to $26.75, furnace, for No. 2 foundry long after other producing centers had advanced to a point where a considerably higher quotation could have been made in competition and not until cost of production had forced an advance, the local pig iron market is now quoted $2 higher. This applies to sales for 1919 delivery as well as to the first half. The leading interest also is applying its higher differential on silicon above the No. 2 grade, which has been in effect for some time. Buying for prompt delivery has become more and more difficult and because of the great decrease in production resulting from the strike, practically the only source of prompt iron now is the South and East. As a result all iron consigned from the Birmingham district, Tennessee and the valleys is being disposed of as soon as it starts for this market. Melters will take virtually anything offered, even at price several dollars higher than the prevailing Chicago market. Local producers not only are oversold against probable production to Jan. 1, but have also contracted for the major portion of first half output. All but a few recent sales have been at the old price. As a result of this condition and the uncertainties of the future, selling is being restricted as much as possible.

While all grades are in demand, basic and malleable seem to be most active. A large user in the St. Louis district closed recentlly for 25,000 tons of basic for first half. An inquiry for 12,000 to 15,000 tons of basic for the same delivery is current. A Chicago interest has placed 10,000 tons of malleable for a plant located in Indiana, 3000 tons for 1919 delivery being placed with eastern makers, mostly in the valleys, and 7000 tons for first half being divided among furnaces at Chicago and in northern and southern Ohio. A large manufacturer of car wheels has placed 5000 tons of malleable for first half with Chicago furnaces. A northern Illinois machinery manufacturer bought 2000 tons of 2.50 to 5.00 silicon for 1920, and 200 tons of 4.50 silicon for this year. Virginia makers are quoting much above other producers. A Tennessee stack about to blow in is quoting $28.75 for 1.75 to 2.25 silicon, $30 for 2.25 to 2.75 silicon, and $31 for 2.75 to 3.25 silicon, for 1919 delivery. This price applies at the furnaces with freight rate of $4.40 to Chicago. Low phosphorus iron is being sold at $40 to $42, delivered Chicago. Production is being increased gradually. Two merchant stacks have been returned to service, and a third will be relighted shortly.

Pay Premiums for Spot Iron

Boston, Oct. 20.—A reversal in the foundry iron market for first quarter as compared with spot and last quarter iron has taken place. A week ago there was a premium on 1920 iron and today there is a premium on spot iron, with a tendency toward softening in the future delivery market. Iron for immediate delivery is hard to obtain and many round orders have been refused. Foundries which have been relying upon Buffalo furnaces for supplies have anxiously placed orders with the first furnace offering spot iron, practically regardless of price. The spread on first quarter and first half iron is continually widening. Sales of Buffalo No. 2X (2.25 to 2.75 silicon) for first quarter have been reported at $27 furnace, and a sale of 200 tons of eastern Pennsylvania iron of the same grade was made during the week at $28 furnace for first quarter. Most of the business has been in small tonnages. One or two Virginia furnaces have spot iron to offer and this is finding a ready small-lot sale at $31.25 furnace for 2X. The Sullivan Machinery Co., Claremont, N. H., bought 700 tons of No. 2 northern (1.75 to 2.25 silicon) for first quarter at a price which is reported to be low. An eastern Massachusetts concern bought 400 tons of spot eastern Pennsylvania 2X iron at $32 furnace. A Rhode Island consumer bought 200 tons of spot No. 2X at $33 eastern Pennsylvania furnace. One Birmingham furnace interest reports approximately 50,000 tons of foundry iron stored in its yards. Sales and inquiries have been exceptionally light among Boston dealers. Several of the large textile machinery foundries have placed small orders for spot delivery merely to be on the safe side. The Chapman Valve Co., Springfield, Mass., has been asking for 500 tons for immediate delivery, and has placed part of this. The Framingham Foundries, Framingham, Mass., is out for 500 to 1500 tons, and other concerns are asking for last quarter lots ranging from 200 to 1500 tons.

Prices Move Up Rapidly

New York, Oct. 20.—A boom market in pig iron has developed in the East. In view of the scarcity of iron, the continued demand is serving to move up prices rapidly. Eastern Pennsylvania foundry has been sold direct by makers during the past week as high as $33, furnace, for 2.25 to 2.75 silicon, and at $32 for 1.75 to 2.25 silicon for shipment this

year. The minimum on central Pennsylvania foundry is up to $31, furnace, for 2.25 to 2.75 silicon, and $30, furnace, for 1.75 to 2.25. Virginia iron is higher, as is reflected by a sale of 400 tons of 1.75 to 2.25 silicon at $30, furnace. One Virginia maker reports a sale of 2.25 to 2.75 silicon, at $35, furnace, for shipment to a nearby consumer. Asking prices on 1.75 to 2.25 silicon, southern, range from $29 to $29.50, Birmingham, although some low manganese iron is said to be obtainable at less. Southern foundry, containing 2.25 to 2.75 silicon, is held at $29.50 to $30, Birmingham, according to prices quoted the past week. Buffalo iron has been sold during the week at $31, furnace, for 2.25 to 2.75 silicon, and $30 for 1.75 to 2.25 silicon. All of these prices apply to foundry iron for shipment this year. The furnaces generally continue indisposed to sell for next year. At least two eastern Pennsylvania furnaces during the week sold first quarter or first half tonnage at $32, furnace, for 2.25 to 2.75 silicon, and this price is considered minimum. A round tonnage of Buffalo iron for first half has been sold at $31, Buffalo, for 2.25 to 2.75 silicon, and at $30, Buffalo, for 1.75 to 2.25 silicon. It is understood some central Pennsylvania foundry has been sold for first half at $31, furnace, for 2.25 to 2.75 silicon.

Business closed in this district during the past week involved 10,000 to 15,000 tons of foundry iron for domestic consumption. In addition there was some export business which included 1000 tons of eastern Pennsylvania iron to Sweden at $32.25, furnace, for 2.25 to 2.75 silicon. Inquiries of at least 10,000 tons of foundry are current. There is considerable export inquiry. Nothing has developed from the inquiries for 60,000 tons of basic for Japan. Some malleable has been sold at $32, eastern Pennsylvania furnace, equivalent to about $34, New Jersey tidewater. A sale of 3000 tons of basic recently was made to a Bridgeport consumer.

Foundry Prices Move Up

Pittsburgh, Oct. 21.—Prices of foundry pig iron here have begun to swing into line with those in other districts and $26.75 furnace, definitely has disappeared for No. 2 grade (1.75 to 2.25 silicon). Most producers now are asking $29 furnace for the remainder of the year, and $28 is as low as any sales recently have been made. Although 600 tons of No. 2 foundry for the first half were taken at $30 furnace, the more general disposition of furnace interests is to fight shy of 1920 contracts. A fair amount of business recently has been done in basic and bessemer. A Pittsburgh district steel foundry recently closed for 500 tons of standard bessemer for November-December at $27.95 furnace. Another lot of 250 tons was taken by a Pittsburgh district steel manufacturer, also at the regular market price, while several small orders have been placed. A Pittsburgh district steel foundry is looking for 1500 tons, for November and December, and the first month or two of 1920. Not much has been done in basic iron since the Steel corporation subsidiaries withdrew from the market which they did recently, following purchases aggregating in the neighborhood of 90,000 tons of steelmaking iron. All but about 20,000 tons of it was basic, the remainder being bessemer. A sale of 2000 tons of basic to a Pittsburgh district steel manufacturer for this year is noted at $25.75 valley furnace. Sales of foundry iron generally have been in small lots, due to the fact that the producers have little free iron for the remainder of the year. A number of foundries are running short of supplies and are trying to pick up tonnages here and there. Active demand for foundry iron also is being made by brokers, who freely have offered $26.75 furnace without securing any appreciable tonnage. A small sale of No. 1 foundry (2.75 to 3.25 silicon) for prompt delivery is noted at $33.75, while small lots of No. 2X (2.25 to 2.75 silicon) have sold at $31 and $32. Small tonnages of malleable have been sold at $27.25 valley furnace and a sale of 2400 tons of Lake Superior charcoal iron for this market for the first half has been made at the full schedule of $31.25. Little change has taken place in the number of active stacks since a week ago except valley steelmaking plants have more furnaces blowing while the stack of the McKeefrey Iron Co., Leetonia, O., is expected to go in shortly on bessemer.

Prices Increased at Buffalo

Buffalo, Oct. 21.—The price of pig iron in this district is increasing. One of the two interests not affected by the strike has sold several thousand tons of foundry at these prices: Silicon, 1.75 to 2.25, $29; silicon, 2.25 to 2.75, $30; silicon, 2.75 to 3.25, $31. A considerable tonnage of malleable has been sold at $29.50. This iron is for 1920 delivery and is being sold in limited quantities. The company doing the business is sold up for this year. It also is reported that even higher prices have been realized on tonnages of resale iron. Foundry iron (1.75 to 2.25 silicon) brought $31; silicon 2.25 to 2.75, $32.25, and silicon 2.75 to 3.25, $34. This is the best price realized here in some time. A sale of 2000 tons of malleable for November shipment was closed at $28, furnace. An interest which is out of the market for 1920 iron will resume quoting in another month and announces that there will be a considerable advance over present prices. Two large producers still are crippled by the strike, one furnace being down.

Prices Showing Upward Trend

Birmingham, Ala., Oct. 21.—A lull was noted during the past week in the buying of pig iron. Quotations are showing an upward trend, $29 for No. 2 foundry (1.75 to 2.25 silicon) now being named. Inquiries are still numerous for delivery during the first quarter but $30 is the lowest price considered. No sales are announced at this figure. Furnace companies are making no effort to get 1920 business, but it is apparent that the books will be open for the coming period by the end of this month. While there is some iron in furnace yards in this district, the aggregate tonnage is less than a month's output. Railroad car service is improved, and there is a good outward movement.

Car Supply Greater Factor

Cleveland, Oct. 21.—Supplies of cars to the furnaces which already were insufficient, have been cut down sharply during the past few days by the railroad administration in an effort to concentrate equipment on the coal routes because of the threatened coal strike. It has become increasingly difficult to move iron from furnace stocks; direct shipments have not been much affected as yet but in the present situation it is feared these two may be interfered with. The result is that deliveries of iron where the furnaces have been able to ship, are becoming more uncertain. This is adding its effect to tighten the market on iron both for early and forward shipment, and further advances have been established. Local makers are holding 1.75 to 2.25 silicon foundry for this year at $30 furnace and for first half at $29 furnace, and have made sales on this basis. Malleable is quoted at 50 cents higher. A portion of a round purchase of malleable by an Indianapolis melter for first half, went to Cleveland makers on this basis. Further sales of southern Ohio iron at $29.75 furnace for No. 2 foundry, or $32.15 Cleveland, have been made. Some valley No. 2, slightly irregular in phosphorus, has been selling for early shipment at $28.50 furnace or $29.90 Cleveland. One producer sold 2000 tons of off cast additional at regular differentials under the old $26.75 base. A fairly good run of sales for early shipment continue to be made but the tonnage is not heavy. Inquiries for first half are more numerous and there is some selling at the advances. Recent sales of about 10,000 tons of basic for first quarter are reported by on valley producer at $25.75 furnace. Some of the northern Ohio steel plants which have been strike-bound have ordered resumption of basic shipments against contracts. Pig iron production in Cleveland has been resumed by the blowing in of one of the furnaces of the Cleveland Furnace Co., one of the McKinney Steel Co. group and the Upson Nut Co. stack.

Take on More Business for 1920

Cincinnati, Oct. 20.—Southern Ohio producers are more willing to take on business for next year. Quite a number of sales of foundry iron (1.75 to 2.25 silicon) have been reported at $29.75, Ironton, for first quarter and first half shipment. It is rumored that this price has been shaded for desirable customers. However, the furnaces are not willing to sell their entire output for the period named as they still are in the dark as to what future costs will be. Southern producers are able to get a premium on iron for prompt shipment and some iron analyzing 1.75 to 2.25 silicon has brought as high as $29, Birmingham, although the regular price for delivery through the remainder of the year is $28. No interest in the South is yet willing to announce that its books are open for next year, although there are a large number of inquiries out for first quarter and first half iron. Northern malleable continues quite

active. It is understood that the Link Belt Co. has purchased a part of the 8000 to 10,000 tons of malleable wanted for its Indianapolis plant from producers in the Cleveland district and the remainder elsewhere.

Foundry Iron Cleaned Up

Philadelphia, Oct. 21.—Demand upon eastern furnaces from pig iron consumers in this district but mainly in New England and to some extent in New York state has served to clean the market of foundry tonnage for this year. As a result, the unusual spectacle has been witnessed the past week of sales of Pittsburgh and valley foundry and malleable iron for shipment to New York state and eastern Pennsylvania. One eastern interest being unable to obtain iron in east, bought western No. 2X (2.25 to 2.75 silicon) at higher than $34 delivered. On occasional lots of eastern Pennsylvania iron sold the past week for this year $32 furnace has been minimum and $33 has been done for No. 2X. Several thousand tons of gray forge were sold to an eastern Pennsylvania consumer at $29.40 delivered and at least 7000 tons were refused because the furnaces cannot spare it. It is reported one eastern puddling mill is down because of a lack of iron. Producers' ideas on first quarter gray forge are $3 to $4 higher than the present price. The largest inquiry now out is 6000 tons of gray forge for first quarter. The Altoona Iron Co. also is reported in the market for a big tonnage of gray forge. Eastern Pennsylvania malleable was sold the past week at $32 and $32.50 furnace. Western charcoal iron which has been selling actively here of late now is pretty well taken up through the first quarter and an advance of $2 is talked of. Central Pennsylvania furnaces practically are sold up for this year but still some iron to offer at $30 and $31 furnace for No. 2X. One of these furnaces now is selling some first quarter iron at $30.50 to $31 furnace for No. 2X. More than 1000 tons of Virginia No. 2X was sold the past week at $30 furnace and some was sold at $31 but these prices now have been withdrawn by this seller and an advance is expected. Some Virginia No. 1X has been sold the past week at $31.75 furnace. Although the last sale of basic was $28 delivered eastern Pennsylvania this could not now be duplicated as makers are asking $30 and $31 furnace and this grade very scarce. Over 1000 tons of standard low phosphorus were sold the past week at $37 furnace.

Heavy Consumption at St. Louis

St. Louis, Oct. 20.—Consumption of pig iron in this district continues on a large scale. Practically all users, except steel plants are working at capacity. Demand for foundry iron is in excess of supply, and several foundries have been obliged to refuse business because of uncertainty relative to obtaining iron. Southern furnace interests are well sold through the balance of this year, and aside from a few car lots and some off iron, have nothing available for immediate delivery. There is some trading in small tonnages, ranging from 200 to 600 tons.

Coke is Advanced Sharply

Increase in Price of Coal and Threat of Strike Send Spot Furnace Fuel Up to $4.60—Producers Holding Surplus in Anticipation of Shortage

Pittsburgh, Oct. 21.—The price of spot furnace coke has mounted with great rapidity in the past few days under the influence of conditions in the coal market. A week ago it was possible to buy standard 48-hour fuel as low as $4, ovens, as well as a few tonnages of unconsigned coke for even less. Today $4.50 is as low as could be done and $4.60 and $4.75, ovens, are the more common asking prices of those operators who have any surplus tonnages over contract requirements and are willing to sell. Not a few of the Connellsville producers have some surplus coke but are inclined to hold it in the belief that next week will see even higher prices than now prevail. While there is a fairly active buying movement in progress in furnace coke in anticipation of a shortage in the event that coal miners strike, the chief reason for the advance is to be found in the rapid rise in the coal markets recently. The sales of mine run gas coal are reported as high as $3.50, mines, while the same figure has been paid for screened ¾-inch pan-handled coal, and low volatile central Pennsylvania coal has done $4 for run of mine. Even the railroads are buying coal for stock and in the event that the strike is called off it is probable that a great deal of high-priced coal will be in the hands of consumers. The Connellsville region is a non-union one, but in well-informed quarters it is stated that with a strike on elsewhere, there would be bound to be some sympathetic response in that region, while at best it would probably be swamped with demands for coal. Nothing actually is going in contracts for furnace coke although a number of inquiries have come out from consumers. A basis of six to one on basic pig iron is said to have been quite freely offered by the blast furnace interests for first half of 1920 fuel. Foundry coke shows no special change in price, for demands are comparatively moderate and supplies are fairly large. The Connellsville production of coke for the week ending Oct. 11 is estimated by *The Connellsville Courier* to have been 152,764 tons as compared with 157,600 tons in the previous week.

More Buying in East

New York, Oct. 20.—Coke sellers report some improvement in the demand in this district and a few thousand tons have been sold.

Strike Threat is Factor

Boston, Oct. 20.—The threatened coal strike has become the big factor in the coke market. Many Connellsville ovens announce that no more orders will be taken for shipment to New England points. With the Providence by-product producer sold up for this year consumers mainly are depending upon the Everett producer for new orders above present contracts. Prices are unchanged at $10.90 for 1919, and $11.90, flat for first half of 1920. Spot prices, however, have been shaded in some instances. It is probable that $10.25 to $10.50 could be done on a sizable order for immediate shipment.

Prices Advanced at Cincinnati

Cincinnati, Oct. 20.—The Wise county field has been drawn on quite heavily of late both for furnace and foundry coke. It is reported that some furnace coke has been sold recently for shipment to southern iron producers. Prices have advanced sharply and 48-hour Wise county coke is quoted around $6 to $6.50, ovens, and foundry grades from $7.50 to $8.

Good Demand at St. Louis

St. Louis, Oct. 20.—Dealers report an excellent demand for coke, with foundry interests buying the most. Prices are steady with Connellsville 72-hour coke quoted at from $6.50 to $7. A fair tonnage of New River coke was reported sold to a melter in the northern part of this district, at $11, for delivery through the balance of the year.

Trying to Accumulate Supplies

Birmingham, Ala., Oct. 21.—Coke production in the Birmingham district is being rushed. Demand for both furnace and foundry coke is brisk, and apparently an attempt is being made to accumulate supplies to meet emergencies.

Ore Shipments

Curtailed by Government Taking Cars to Move Coal

Cleveland, Oct. 21.—Just as ore shipments to furnaces were picking up after several weeks of stagnation due to the strike in the iron and steel industry an order was issued this week by the railroad administration taking from the ore shippers 50 per cent of their cars for immediate use in anticipation of a strike in the coal industry Nov. 1.

Cars at lower lake ports awaiting to be loaded with ore for the furnaces must be sent back empty to the coal mines in order that maximum shipments may be made before the threatened walkout and to insure an early distribution of the available supply.

The curtailment of car service will interfere seriously with shipments, ore companies say; and as nearly all the storage space at lower lake ports is taken, a still slower movement of ore from the Lake Superior district is anticipated.

Apparently the threatened coal strike is affecting the ore trade in another respect. A leading ore operator has received orders from one of the largest furnaces in the East to suspend 15 per cent of the total tonnage of ore ordered for the season, and similar requests have been received from other furnaces.

Foundry Scrap in Demand

Cast, Malleable and Other Grades Move Higher as Pig Iron Scarcity Grows—Melting Steel is Sluggish

FOR COMPLETE SCRAP PRICES SEE PAGE 1154

Chicago, Oct. 21.—With the steel strike well in hand some movement of scrap to mills resumed and a heavy demand for cast and malleable and other grades for foundry use, quotations on iron and steel scrap in the Chicago district are moving upward gradually. Cast scrap for gray iron foundries is increasing as melters find their supply of pig iron becoming less and it has sold as high as $29, delivered Chicago. Malleable grades, which have not been in demand and which have been ruling at $6 per ton under No. 1 cast are now picking up, as foundries are seeking this material to piece out their needs in the face of reduced pig iron deliveries. Considerable tonnage of rolling mill grades is moving to bar iron mills. Rerolling rails are unusually scarce and mills using this material are competing actively for the tonnage offered. The ordnance department took bids a few days ago on 1500 tons of 3-inch shell forgings at Moline, Ill., and made a tentative sale at $18.50 per net ton on 300 tons and $18 per net ton on 1200 tons. The same department received a bid of $19.60 per gross ton on 820 tons of 6-inch shell forgings at Port Clinton, but this was rejected and the material probably will be offered again. The Rock Island railroad has put out one of the largest lists offered recently by any western railroad, involving 4200 tons, of which 1000 tons is No. 1 steel rails and 750 tons wrought scrap.

Buyers Are Cautious

Boston, Oct. 20.—The scrap iron market continues to improve. Pennsylvania consumers' recent purchases have not reached the tonnage looked for. Buyers invariably pursue a cautious course as the situation still is far from clear. Some companies have been buying steel scrap instead of pig iron because of difficulty in obtaining the latter. Borings find a ready sale at $13.50, and little cast scrap is allowed to accumulate. Foundries which have hesitated to buy pig iron in many cases have been getting in good supplies of scrap, and the price of No. 1 machinery has held firm at $28 delivered.

Scrap Advanced at New York

New York, Oct. 20.—With demand steadily increasing, prices in the local scrap market are moving upward. This tendency especially is noted in heavy melting steel, borings and turnings. The market on heavy steel now appears to be firmly established at $15.50 to $16, New York, and borings and turnings at a similar advance of 50 cents to $11 and $11.50. Advances also have been made in old steel shafting, railroad wrought and heavy cast scrap. Owing to the improvement in the labor situation in eastern Pennsylvania, the movement of steel borings and turnings has increased considerably, with the freer supply of labor for unloading, the rejections which were noted recently, particularly at Bethlehem, no longer are in evidence. A better demand is also in evidence for cast scrap.

Foundries Buy Up Cast

Philadelphia, Oct. 21.—Brisk buying of cast scrap has featured the eastern scrap market the past week. New England foundrymen who have been unable to get the usual pig iron shipments from Buffalo because of the strike have been buying pig iron elsewhere and scrap to fill in. Big tonnages of cast scrap have been moved here to New England during the past week at $28 to $28.50 delivered. For eastern Pennsylvania delivery, however, the market on cupola cast continues at $25 to $26. Wrought scrap also is in good demand as well as forge and bundled sheets and all borings and turnings, but heavy melting steel is dull due to the fact the mills will not pay what dealers ask.

Buyers Still are Cautious

Pittsburgh, Oct. 21.—Possibility of a coal strike has become a factor in the scrap market, for while consumers generally have been showing more interest as the steel strike has lost its force, purchases have not resulted. The general explanation is that the steel manufacturers, as well as the founders, want to be sure business is not going to be tied up by closing of the coal mines. A rather strong tone is noted in scrap prices, notwithstanding the lack of activity. It is patent in view of the fact that production of pig iron at steel plants has suffered heavily, and as not much scrap has been moving to the steel plants, stocks of scrap must have been drawn upon extensively. Most steel companies now are issuing permits for the shipment of tonnages held up by railroad embargoes. It is reported that a round lot of heavy melting steel recently was bought by a Pittsburgh district steel company at $22, delivered, but this cannot be verified. Only small lots of this grade are available and these are moved at about $20 to $20.50. Railroad malleable is scarce, and users have lifted their bids materially. A fairly good market exists for wrought scrap and for cast iron scrap, with No. 1 cupola readily saleable at $25 to $26.

Good Demand for Car Wheels

Buffalo, Oct. 21.—Demand for car wheels features the Buffalo scrap market. Good inquiries are reported by dealers from users in this district, but this grade is difficult to obtain. Cast scrap also is active, and the price remains firm. Local users are not in the market for much heavy melting steel, but this situation is expected to change in a week or so, when local mills plan to resume operation. There is a light demand for steel from other districts. Heavy melting is quoted at $18 to $19.

Cast in Good Demand

Cleveland, Oct. 21.—While heavy melting steel continues to drag in the Cleveland scrap market, cast grades are in heavy demand. Some No. 1 cast has been sold here for $26, and the range now is $25.50 to $26. Heavy cast has moved up to $18.50 to $19, and car wheels to $23 to $24. Malleable also is wanted and both the railroad and the agricultural grades have been advanced. Many dealers are reported to have sold short on malleable, and are now in a tight place. With melting steel demand still low on account of the strike, the price is a trifle firmer. Dealers believe the market will pick up shortly, as attempts are being made to operate more plants in this district.

Cincinnati Market is Firmer

Cincinnati, Oct. 20.—The scrap market is quiet but a trifle firmer. Embargoes against shipments to the Pittsburgh district are a factor, but the situation is showing some signs of improving. Heavy melting steel, that has been weak for some time past, now is recovering, but no recent advances are noted. Foundry scrap continues to move freely. All prices are unchanged.

Strong Demand Felt at St. Louis

St. Louis, Oct. 20.—Consumptive demand for scrap iron and steel has improved and prices have been marked up on practically all grades. Dealers are bullish in their views, some of them looking for a return of a boom almost as pronounced as during the war. Rolling mills throughout the country are trying to purchase scrap wherever it can be obtained, and St. Louis dealers can now ship supplies East at a profit. Reports received here indicate an acute shortage of rolling mill grades both in the East and North. All the foundries are busy and the market for their grades is strong, with available supplies light. The American Steel Foundries is in the market for a round tonnage of special grades of heavy melting steel, and the American Car & Foundry Co. has also been inquiring for material, but is unwilling to pay the prices asked. The St. Louis Screw Co. is in the market for all varieties of rolling mill material, and stove manufacturers have placed inquiries for fair tonnages for prompt delivery. Offerings out of first hands are extremely light. The only railroad list before the market was one from the Wabash, offering 200 tons.

Need Scrap in South

Birmingham, Ala., Oct. 21.—Improvement is noted in the scrap market in the South, although quotations are unchanged. Some of the consumers of heavy melting steel and other material are making inquiries, but are unwilling to pay the prices quoted.

Fair Shipments

Continue in Sheets—Operations Gain —Talk Advance in Galvanized

Pittsburgh, Oct. 21.—The sheet situation continues to improve. All the mills, which shut down as a result of the walkout of Sept.22 and since have resumed, still are operating and with a fuller complement of men than was the case even as recently as a week ago. Men have been going back to work at practically all plants throughout the country, capacity now in use is being more fully manned and production is running along more evenly. Shipments still are lagging but gradually are improving. The American Sheet & Tin Plate Co. continues to operate more than 80 per cent of its sheet mills and the showing of the independents is practically as good, due to the fact that the Trumbull Steel Co., Warren, O., this week is running 100 per cent. Numerous demands for sheets are coming out from consumers whose ordinary source of supply is curtailed or shut off as a result of the strike. Most companies, save possibly one or two which are short of sheet bars, are making fairly good shipments on contracts. None of them is paying any attention to the new demands.

Orders Are Turned Away

Philadelphia, Oct. 21.—Sheets are constantly more difficult to obtain and particularly so by reason of the strike in the mill department of the leading eastern maker of blue annealed. Orders are being turned away right along. Among the current orders is one for 300 tons of blue annealed for India.

May Advance Galvanized

Youngstown, O., Oct. 21.—Sheet shipments from valley mills continue on a small scale since only two plants are rolling. At these particular plants orders in hand are heavy and it is not thought any additional business will be considered until these makers start on 1920 bookings. This condition was true of every valley sheetmaker even before operations were interrupted by the strike. Five weeks ago rolling schedules at many of the sheet mills in this district showed but few openings.

The present level of galvanized sheets is likely to change soon in the opinion of certain makers of this product here. They feel that independent makers will be compelled to boost the price unless the upward movement of spelter is checked. Those makers whose supply of spelter is running low, will have to replenish their stocks on a 7.70c basis. They state that with spelter at this figure, coated stock on a 5.50c basis will not show even a fair profit. That the price of spelter is not only pinching sheetmakers but galvanized nailmakers as well is evidenced by the recent advance of 5.00c per keg in the price of this product.

Inquiries coming to valley sheet mills now active, are heavy; where mills are inactive, however, inquiries are light. Dealers state stock sheets are well bought up and that tonnages of any grade available for immediate shipment, are becoming scarcer right along. In the case of certain brokers, who are authorized to sell several hundred tons of black sheets for the French government, higher premiums are asked this week than last.

Little Business

Being Accepted in Wire Products—Export Nails Bid High

Pittsburgh, Oct. 21.—Although operating conditions are improving among the manufacturers of wire and wire products, about the only new business that is being taken is in fence wire and on this line makers are making no guarantees as to time of shipment. The orders, in fact, amount to little more than reservations. One company has a limited tonnage of barbed wire and of the heavier gages of galvanized wire for immediate shipments, but in general, current production of wire, nails and other products is insufficient to meet more than a small portion of the live contract obligations of the producers. Export demands for wire and nails are extremely heavy, particularly from the Orient. One maker here reports having turned down an order for 8500 kegs of nails at $4 a keg, Pittsburgh, for shipment to Japan because the tonnage was not available. Actually it is believed $4.25 or even $4.50 would be paid for export nails in 8, 16 or 20-pennyweight sizes. The country is bare of these sizes as wooden building construction has been on a far heavier scale than is generally supposed and with production limited, supplies have gone down rapidly. Plants of the American Steel & Wire Co., all through this district are gaining in operation and production.

Railroad Needs

Being Lined up by Purchasing Officials—Egypt Places Locomotives

Chicago, Oct. 21.—Manufacturers of steel rails and fastenings find that purchasing departments of railroads are lining up their requirements for 1920 and preparing the way for purchases as soon as they are given permission, or the roads actually are turned back to their owners. For some time supplies of necessary material have been held back and heavy buying undoubtedly will follow their return to private ownership. Some selling of rails for prompt delivery is being done in small tonnages. Demand for light steel rails has slackened somewhat because of the threat of a miners' strike, which will cut down the quantity used in mine work. Export inquiry is excellent, that coming to the western mill being mostly from South America and the Orient.

The Texas Pacific railroad is inquiring for 69 passenger equipment cars of several sorts, which will require about 1000 tons of finished steel. An Indiana carbuilder is figuring on 250 cars but the name of the railroad has not been divulged.

Egypt Places Locomotives

New York, Oct. 20.—An award of 50 locomotives for Egypt has been made the Baldwin Locomotive Works. Inquiries for 65 additional locomotives for Egypt are current.

Higher Rail Prices Reported

Pittsburgh, Oct. 21.—Vague rumors have been heard here of a $2 advance in the price of standard rails but this cannot be confirmed at the offices of the leading maker in this district.

† American Smelting & Refining Co.'s price.
‡ Producers' price. Outside market, Oct. 15, 22.25c; Oct. 16, 22.25c; Oct. 17, 22.25c; Oct. 20, 22.00c.

NEW YORK, Oct. 21.—The most important development in the metals market the past week was the departure of leading copper producers from the 23.50c price, previously firmly maintained for three months. One of the largest agencies quietly sold several thousand tons of electrolytic copper at prices down to 21.75c, f.o.b. refinery, then advanced its quotation to 22.00c. Outside sellers continued to do a little business in second hand copper at around 22.00c. Export demand for copper has been in evidence now and then, Germany placing orders for about 700 tons through sellers outside the Copper Export association. Japan also has been inquiring for copper. Inquiries for about 600 tons of copper rods for shipment to Europe came into the market Oct. 20. Casting copper is steady at 21.00c to 21.25c; Lake copper 22.00c to 22.25c.

The American Smelting & Refining Co. advanced its lead price Oct. 16 a quarter cent a pound to 6.50c, New York, 6.25c, East St. Louis. Before that action, however, outside sellers had been asking 6.50c, New York, while immediately afterwards outside sellers advanced their prices to a substantial premium.

The feature of the zinc market has been the resumption of export inquiries and sales, and today galvanizers inquired. England and Japan both have been in the zinc market and several thousand tons are reported to have been sold. England has wanted both grade A and prime western, while Japan has inquired for 98 per cent zinc, equivalent to prime western. Prime western is quoted about 7.75c to 7.80c, East St. Louis basis for October shipments, with five points premium for November and December.

Bar Users Playing Safe

Consumers Close Tonnage to Win Place on Mill Books—Eastern Prices Up—8700 Tons of Bar Iron Placed

Chicago, Oct. 21.—With production uncertain, most consumers of finished steel are seeking to place their contracts with makers in order to secure a place on rolling schedules and thus stand a better show of receiving material when conditions improve. At present practically all consumers who have followed this rule in the past and specified promptly are receiving steel while the hand-to-mouth buyers who did not insure their supply are not so well situated and are seeking by other means to obtain prompt deliveries. The result is that fairly large tonnages of soft steel bars are being contracted for mostly for current shipment, but a moderate portion is for next year's delivery. Prices have not been changed from those prevailing over the past few months.

Excellent demand exists for bar iron with railroads taking moderate tonnages. The latter are taking whatever excess is manufactured by the mills of the Santa Fe and Great Northern railroads, which is not large, but exerts considerable influence in the market. Booking of business is sufficient to keep mills operating steadily but does not create a backlog.

Manufacturers of hard steel bars rerolled from rails are turning down business as they are unable to take all that offers.

Bethlehem Advances Price

Philadelphia, Oct. 21—The Bethlehem Steel Co. has advanced the steel bar base to 2.50c, Pittsburgh, making the price on forging quality 2.75c. This level is the same to which the Cambria Steel Co. advanced some time ago. Those mills which are operating are accepting business from their regular trade but are so fiilled up with orders that they must accept new ones cautiously. Considerable new bolt business continues to come from shipbuilders and several hundred tons were placed the past week. The Emergency Fleet corporation is taking bids on 1500 kegs of fitting-up bolts.

Premiums Could be Obtained

Pittsburgh, Oct. 21.—Although production of merchant steel bars is gaining as a result of the resumption of operations at a number of the mills and the fact that men are daily coming back to work, supplies are extremely inadequate for the demand and there is no question but what some buyers who must have supplies immediately would be glad to pay premiums to secure them. An offer of a premium, however, does not interest manufacturers just now, as they are more chiefly concerned in meeting contracts so that they will not get too far behind their obligations. Users of merchant steel bars have been considerably less affected by the labor disturbance than have been the producers. Scarcity under these conditions was to be expected.

Substitution of iron bars for steel still is noted, sales aggregating 8700 tons of iron bars being noted to northern Pennsylvania oil interests who are taking the material and converting it into drill rods because of their inability to secure steel bars. This business went almost entirely to western bar iron makers and was placed at a price approximately equivalent to 2.75c, Pittsburgh, for common merchant iron. Pittsburgh district producers of iron bars are holding generally at 2.75c, although it is reported that one maker recently has named a price as low as 2.50c.

Bolt Mills Lack Bars

Chicago, Oct. 21.—Manufacturers of bolts and nuts are meeting considerable difficulty in obtaining sufficient raw material, as the steel strike has limited shipments of steel bars. In some cases plants have been forced to close down for lack of material. Demand from consumers is heavy and much of it cannot be entertained. The uneven condition of steel supply leads consumers to enlarge their inquiries to mills in operation to make up the deficiency. However, in most cases bolt makers are willing to take only their share. An inquiry for 5,000,000 bolts now current in this market has been turned down by some producers.

Bar Shortage is Felt

Pittsburgh, Oct. 21.—Although none of the makers of nuts, bolts and rivets here has been obliged to suspend operations because of the shortage of bars and rods, resulting from the strike, some of them are suffering from insufficient supplies of steel. Shipments to both consumers and jobbers are going forward fairly well and no real pinch yet exists in the supply. Prices are unchanged.

Production is Gaining

Pittsburgh, Oct. 21.—Hoop and band mills in this district are running more normally and production is gaining steadily. Makers, however, are committed for some time in advance, and it will be probably a couple of months before normal conditions are restored. Consumers are not pressing producers unduly for shipments but new demands are getting no consideration. Cotton ties are in ample supply to meet all current demands.

Now Turning Down Orders

Pittsburgh, Oct. 21.—From a condition where they were inclined to take orders regardless of their size, some makers of cold finished steel bars and shafting now are so heavily committed that they recently have been obliged to turn down new orders, among them some extremely attractive ones. Nonintegrated manufacturers are beginning to feel the pinch in the supply of merchant steel bars, due to the strike suspensions, and those makers who produce their own raw material have been flooded with business from those consumers unable to get full shipments from regular sources. Automobile and tractor builders want large tonnages for prompt shipment. The market is extremely firm at 3.60c, base, Pittsburgh, because production is falling behind consumption and orders are backing up on makers.

Spiegel Tonnage

Of 10,000 to 12,000 Placed by Belgium and Holland—Sale at $33

New York, Oct. 20.—Despite the fact that some makers of spiegeleisen have been firmly maintaining a minimum price on 18 to 22 per cent metal, of $35, furnace, this figure has been shaded right along on the few attractive orders that recently have been offered. Following a recent sale of 400 tons at $34, furnace, as previously reported in THE IRON TRADE REVIEW, a sale of 100 tons was made during the past week at $33, furnace. The market now may be quoted at $33 to $35, furnace, for 18 to 22 per cent. Current inquiries include one lot of 500 tons, another of 300 tons, and some smaller lots. The most important business in the spiegeleisen market for some time involved the sale, about 10 days ago, of about 12,000 tons of spiegeleisen for export to Belgium and Holland, at prices which are reported to have been higher than $31, eastern furnace, or around $35 net, f.o.b. New York. Other export inquiries are out for 18 to 22 per cent.

There is a disposition to quote higher prices on ferromanganese and during the past week $115, delivered, has been asked on domestic metal for shipment this year. Next year's metal is held at the regular price of $110, delivered. English metal at the moment is not playing much of a part in the market. All English makers appear to be out of the market, with one exception. This interest still authorizes its agent to take business at $100, c.i.f. tidewater, but the latter has not taken any business at this figure. Domestic makers are inclined to believe there is going to be a scarcity of ferromanganese. New buying of the week was light.

About 400 to 500 tons of 75 per cent ferrosilicon recently have sold at around $142 to $145 delivered Pittsburgh district. Several cars of 50 per cent sold at $82, delivered Pittsburgh district, and another car at $82.50.

Between 12 and 15 tons of ferrotungsten imported from England sold at prices somewhat below $1.20 a pound contained, the minimum published quotation of domestic makers. Germany and Japan have been inquiring for ferrovanadium.

Wants $115 for Ferro

Philadelphia, Oct. 21.—One eastern maker is asking $115 furnace delivered for prompt ferromanganese but has not sold at that price yet. It is re-

ported 5000 tons of spiegeleisen were sold to Italy at $33.10.

Not Much is Going On

Pittsburgh, Oct. 21.—Demands for ferroalloys are few and small. Most consumers have some material due them and of course when in a position to use any merely have to order material forward. A few small inquiries for ferromanganese have been before makers recently but buyers are slow to close until they have received bids from all makers. One buyer who has been in the market for 150 tons of 80 per cent material reports having had a quotation of $100 c.i.f. Baltimore on 78 to 82 per cent alloy. The more general asking price, however, on this material is $105, while 76 to 80 per cent alloy is quoted at $100 at tidewater. American makers generally are holding to $110 delivered, for 78 to 82 per cent material.

Only small lots of 50 per cent ferrosilicon have been moving and these have gone generally at $80 furnace, freight allowed. Sellers quoting $85 delivered, into this district report having lost more or less business and even less than $80 is being quoted by Canadian producers, one of whom has named a price of $78, packed, delivered Pittsburgh. Bessemer ferrosilicon still is extremely slow of sale and prices are no more than steady. Small sales of ferrotungsten are quoted at $1.15 a pound and a little ferrovanadium has been sold to consumers recently at $5.75 a pound. Brokers are not able to buy this latter material as cheaply as are consumers.

Tin Plate Demand

For Export is Heavy—Mill Operation Continues to Increase

Pittsburgh, Oct. 21.—The hot mills of the McKeesport Tin Plate Co., which suspended operations a few days ago before the strike, resumed operations this morning, 22 of the 44 mills going into commission. The Trumbull Steel Co., Warren, O., got back today to 100 per cent operations of its tin plate mills. Meanwhile no loss is to be noted among the mills that were active a week ago, and with a steady return of men, production is getting back to normal. Makers of tin plate generally were committed up to the first of December before the strike broke and it probably will be well into next year before these obligations are met. There are only a few of the manufacturers who have any surplus for early delivery and these are in receipt of heavy export demands, among them being an order for 100,000 base boxes for first quarter shipment. The company getting this order accepted only one-half of it, naming a price of $7 per base box, Pittsburgh. Firm offers of $7.25 per base box, Pittsburgh, have been made by Japanese buyers, who would be glad to pay this price if they could get prompt shipments.

An order just placed at Philadelphia calls for 4000 base boxes of tin plate for export to India.

Plate Orders Are Heavy

Eastern Mills Being Besieged With Tonnage—Sun Shipbuilding Co. Places 18,000 Tons and Has 22,000 Tons Pending—Prices Strong

Philadelphia, Oct. 21—The plate market in the East to some extent now has taken on a boom aspect. Big tonnages are being placed right along. Several lots around 5000 tons and many from 1000 to 3000 have been closed. These are for all purposes, but shipbuilding has the prominent place. The mills are unable to promise delivery under six to eight weeks and in some cases orders are being cancelled because the plates are wanted at once. At least two eastern mills are tied up for the rest of the year, mainly on plates for export. Plate prices now are minimum at 2.65c, Pittsburgh, and this price cannot now be shaded on export. One of the larger eastern buyers is the Sun Shipbuilding Co., which has taken 18,000 tons and has 22,000 tons under option. The New York Shipbuilding Co. has bought 3500 tons. The Baldwin Locomotive Works expects to get 200 locomotives for Belgium. The mills as a rule are refusing to sell for next year but one large buyer succeeded in placing a first quarter tonnage with an eastern mill at 2.65c, Pittsburgh.

Makers Are Well Booked

Pittsburgh, Oct. 21.—Manufacturers of plates in this district who have their plants in operation have about all the business they can reasonably meet for the remainder of the year and are not showing much interest in new inquiries even at the full market price of 2.65c, Pittsburgh. So many demands came to makers here from buyers, ordinarily supplied elsewhere, that they soon became committed as fully as they care to be. Reports from the East state that plate makers are obtaining as high as 2.75c, Pittsburgh, but this price has not yet been obtained here, although some buyers probably would be glad to pay it if assured of prompt shipments.

Better Tonnage

Is Shown in Tubular Goods—Cast Pipe Up in South

Pittsburgh, Oct. 21.—Production of tubular goods, both steel and wrought iron, is holding its own, and in some instances is gaining. The National Tube Co. has about the same amount of capacity in operation it had a week ago, but has been able to increase production slightly because more men are back. Normal conditions exist now at the McKeesport, Ellwood City, Pa., and Lorain, O., works of this company, while at its Pennsylvania works in Pittsburgh, half of the furnaces are in operation. Neither the Youngstown Sheet & Tube Co., nor the Republic Iron & Steel Co., Youngstown, O., is operating much pipemaking capacity and the Wheeling, W. Va., producers still are down. The Jones & Laughlin Steel Co. is running its pipe mills full, while at both the Pittsburgh and Girard, O., plants of the A. M. Byers Co., the puddlers are working and some finishing capacity is operating. Spang, Chalfant & Co. also are getting back to normal. Market conditions are much as they have been, with plenty of new business coming out, but not much disposition on the part of manufacturers to consider it.

Private Buying on Good Scale

New York, Oct. 20.—Outstanding among recent awards in the eastern cast iron pipe market is the placing of about 1500 tons with the Warren Foundry & Machine Co., for the soldiers' and sailors' memorial bridge at Harrisburg, Pa. This business was sublet through the Central Construction Co., of that city. The only other large tonnage, that for East Hartford, Conn., involving about 2000 tons, is still pending. The general contract for this work has been let.

Sellers continue to report a good volume of private buying and a lack of public demand.

Western Demand Slack

Chicago, Oct. 21.—With scarcely an important tonnage now under consideration in western territory, manufacturers of cast iron pipe see little hope of adding much to their bookings from this district before the winter season sets in. Prices have become decidedly firm, and no incentive exists to bring about buying on the score of economy, and the close approach of freezing weather is putting an end to excavation. The latter condition is causing contract holders to ask immediate delivery. The American Cast Iron Pipe Co. has taken 650 tons for Columbus, O., the National Cast Iron Pipe Co., 200 tons for Duluth, and the United States Cast Iron Pipe & Foundry Co., 100 tons for Broadwater, Nebr.

Southern Prices Advanced

Birmingham, Ala., Oct. 21.—Cast iron pipe plants in the Birmingham district are literally swamped with business, and there are still many specifications being bid on. Pipe prices have advanced, 4-inch pipe now being quoted at $54, and 6-inch and over, at $53. Every pit at cast iron pipe plants in the South is in operation, and more pig iron is being melted at present than at any time in the past three years.

Sheet Demand Heavy

New York, Oct. 20.—Although mill shipments are somewhat freer, owing to improvement in the strike situation, the situation in the local warehouse market is little changed. Demand for sheets and bars and for many small items continues heavy, and stocks of such material remain low.

New Awards are Lighter

September Contracts Equal Those of August But Buyers Now Acting More Deliberately—Fabricating Workers' Strike Hurts Chicago Market

New York, Oct. 20.—Sizable awards have been lacking in the eastern structural market during the past week. At the same time, new inquiries of importance have been few. Included among the larger projects is a building for the Park Bank Co., New York City, calling for about 1100 tons. This project has been contemplated for some time. Two copper companies, the Anaconda and the Nichols, have issued inquiries for 500 and 400 tons, respectively. The Nichols company plans to erect a building at its plant on Long island, and the Anaconda company, it is understood, requires the steel for work at Butte, Mont.

The report of the Bridge Builders and Structural society issued recently for September is regarded generally as being most favorable owing to the conditions which prevailed during latter part of the month. Despite the unsettlement resulting from the steel strike, the figures showed that 78½ per cent of the capacity of the shops was contracted for, the bookings aggregating 141,000 tons, a total similar to that of the preceding month. A comparative statement follows:

Month	Per cent	Approximate tonnage
September, 1919	78½	141,000
August	78½	141,000
July	74	133,200
June	65	177,000
May	49	88,200
April	24½	48,100
March	17½	32,300
February	12½	22,500
January	12	21,600
December, 1918	29	52,270
November	27	48,700
October	43	77,400
September	60	108,000
August	57	102,000
July	116½	209,700
June	56	100,800
May	60	108,000
April	64	115,200
March	47	84,600
February	55	99,900
January	53	95,400
December, 1917	121	205,200
November	77	138,600
October	61½	110,700
September	29	52,200
August	38	68,400
July	41½	74,700
June	47½	85,500
May	56½	102,000
April	61	110,000
March	68	122,000
February	59	106,000
January	61½	119,000
December, 1916	86	148,000
November	78	134,000
October	77	133,500
September	52½	99,400
August	64	112,600
July	47½	83,600
June	58	100,000
May	80	137,000

Lettings Maintain Average

Boston, Oct. 20.—Statistics compiled by F. W. Dodge Co. show New England building operations mostly industrial establishments so far in 1919 to have exceeded any previous year since 1900. Requests for new plans indicate a large amount of steel construction in 1920 if conditions are at all favorable. The larger contracts let during the past week have been for concrete construction. Structural lettings, while individually small, have shown an aggregate comparing favorably with the average. An office building at Manchester, N. H., will take 125 tons, and the Memorial building for the city of Lowell, 650 tons. Bids are in for the Telephone Exchange building, Boston, approximately, 800 tons.

Orders Piling Up on Eastern Mills

Philadelphia, Oct. 21.—The shape business is active and orders are piling up on the mill so that in some cases deliveries are deferred. One company says that for the past month it has been taking order at a rate double the capacity of its mill. Shape orders are coming principally from fabricators, and also from jobbers. The mills deny they are taking much tonnage which would not come to them but for the strike. A good amount of export business is being done, including the sale of 3000 tons to Japan, and a round tonnage for the Dutch East Indies. The full price applied to this export business, and no more is being taken at 2.55, eastern mill. There is much interest in the Fidelity building project which is to come up for bids soon. It involves about 10,000 tons.

Pittsburgh Mills Well Booked

Pittsburgh, Oct. 21.—Makers of shapes in this district are pretty well booked and are in constant receipt of fresh orders. These conditions, however, are ascribed to the fact that so much capacity in other parts of the country is idle on account of the strike and demands naturally seek the center where they are most likely to be filled. Structural lettings during the past week have been well below the inquiries.

Chicago Bridge Shops Strike

Chicago, Oct. 21.—A strike of employes of fabricating shops in Chicago has shut off the market for structural work in this city, just after the settlement of the building trades strike had started the business forward after several weeks of complete idleness. This has practically stopped production of fabricating material from shops in this city, with a consequent cutting off of demand for plain material from mills. Outside demand is fair and results in mills having plenty of orders on which to work. The largest tonnage let in the West recently involves 1181 tons for a rolling mill building at South Chicago for the Interstate Iron & Steel Co. The state of California has awarded 959 tons for a state building at San Francisco. An inquiry for about 2000 tons of steel for a hotel in Chicago has been halted until finances have been arranged.

CONTRACTS AWARDED

Bridge for Boston & Maine, 100 tons, to Boston Bridge Co.

Addition to the plant of the National Metal Molding Co., Economy, Pa., 350 tons to the Jones & Laughlin Steel Co.

Repair work for Steel & Tubes Co. of America at Indiana Harbor, Ind., 150 tons to Worden-Allen Co.

Hoist house for McKinney Steel Co., Bessemer, Mich., 200 tons to Worden-Allen Co., Milwaukee.

Factory addition for Burgess Battery Co., Madison, Wis., 200 tons to Worden-Allen Co., Milwaukee.

Merchant mill for Interstate Iron & Steel Co., South Chicago, 1181 tons, to McClintic Marshall Co.

State building for the state of California at San Francisco, 959 tons, to the Palm Iron Works.

Manufacturing plant for the James Mfg. Co., Fort Atkinson, Wis., 654 tons, to Federal Bridge Co.

Stack and assembly building for the J. I. Case Threshing Machine Co., Racine, Wis., 274 tons, to Federal Bridge Co.

Service building for Harry P. Branstetter, Esq., Chicago, 131 tons, to American Bridge Co.

Building for Union Motor Truck Co., Bay City, Mich., 200 tons; let to Whitehead, Kales & Co.

Garage for Wink Motor Car Co., Allentown, Pa., 168 tons; let to Lehigh Structural Steel Co., Allentown, Pa.

Power house, State hospital, Utica, N. Y., 450 tons to Phoenix Bridge Works.

Boylston Mills, East Hampton, Mass., 500 tons to Phoenix Bridge Works.

Buildings in Mexico, 110 tons to Phoenix Bridge Works.

Royal Mills, River Point, R. I., 500 tons to Phoenix Bridge Works.

Building for Pennsylvania Forge Co., 250 tons to Belmont Iron Works.

CONTRACTS PENDING

Building for Anaconda Copper Co., reported to be erected at Butte, Mont., 500 tons, pending.

Apartment house at Baltimore, 400 tons, contract pending.

Building for Park Bank Co., New York City, 1100 tons, contract pending.

Building for Nichols Copper Co., Laurel Hill, N. Y., 400 tons, contract pending.

Cattle barn for the state of Iowa university station at Des Moines, 500 tons. Bids asked.

Memorial building for the city of Lowell, Mass., 650 tons, bids in.

Telephone exchange building, Boston, 800 tons, bids in.

Extenson to faitory building, Revere Rubber Co., Providence, R. I., 400 tons; bids being taken.

Higher Prices

Being Named on Semifinished—Sheet Bars Sell at $45 Pittsburgh

Pittsburgh, Oct. 21.—An acute shortage of practically all kinds of semifinished steel still exists here and so many urgent demands are coming from nonintegrated manufacturers, whose regular sources of supply are shut off or crippled by the strike, that it is no exaggeration to say that substantial premiums over the market basis readily could be obtained. As a matter of fact a Pittsburgh district steel company which has not been materially affected by the labor disturbance and which had some surplus steel was able to dispose of it as sheet bars at $45 a gross ton, Pittsburgh, as against $42, the regular market price.

Eastern Prices Advanced

Philadelphia, Oct. 21.—After continued complaint over the high cost of semifinished steel as compared with the selling price, eastern makers have advanced rerolling and forging billets $5 and sheet bars $2.50 per ton to $43.50, $46 and $44.50 Pittsburgh, respectively. About 2000 tons of rerolling billets have been sold at the new figure of $43.50, Pittsburgh.

Export Inquiries Crowd Market

Producers Refusing Fourth Quarter Business—Deliveries are Delayed Until First of Year—Europe Despairing of Getting Supplies Here—Sales are in Volume to South America and to the Orient

NEW YORK, Oct. 20.—Due to the heavy demand and curtailment of production by the strike, nearly all export houses report that they are out of the market for the fourth quarter with one or two exceptions. Foreign purchasers are being advised that plates and structurals and some bars can be had. Blue annealed sheets also have been offered. Otherwise no iron or steel product can be delivered before the first quarter of next year. Notwithstanding the pressure of foreign inquiries there does not appear to be any great demand for quotations on deliveries for the first quarter. A great bulk of the foreign sales already made, which were scheduled for delivery during the fourth quarter, have been delayed until the first quarter of 1920.

Export houses are nevertheless satisfied with the volume of business done and feel hopeful of the prospects for sales during the remainder of the current year. There has been a marked curtailment of business with Europe, but this is compensated for by the business that has been done with the Orient and South America. During the past week or so the sales have included the usual run of orders, the foreign purchasers buying only such goods as they absolutely need.

Despite the unsettled conditions the foreign demand has been so insistent and in such a large volume that they have frequently called forth quotations in face of the unwillingness of the American producers to anticipate the market. In a number of cases the export house has itself assumed the risk and made the quotation to the foreigner. From the terms of these quotations it is learned that the exporters have anticipated an advance of $5 per ton on wire and similar products for future delivery. It is anticipated that there will be no material advance in the price of bars, structurals, plates or sheets. Should any increase be made by American producers it will be contingent upon the terms of the settlement of the strike and the industrial conference now in progress in Washington.

Sheets Are Allocated

Some export houses contend that their foreign inquiry is but normal but qualify this with the statement that they can sell abroad practically everything they can contract for in this country. One house which does a large business with the Orient said it was able to obtain all the commodities it desires, with the exception of sheets. It was said that the United States Steel Products Co. allocates the sheets it has for sale abroad according to the normal consumption of each market. Some of these markets abroad have already purchased up to the full of their allocation while others have not.

Demand for nails has been so insistent that exporters are now paying a higher price. Nails for export are being quoted at $4, Pittsburgh, or $4.05 f.a.s., New York. The f.a.s. New York price on plain wire is $3.77, on galvanized wire, $4.47, and on barbed wire, $4.89. These increased quotations indicate the direction in which the market is tending.

While inquiries are being received and some sales are being made, the exporters are beginning to realize that the European trade is of negligible quantity. The market was much excited over an inquiry from Belgium for 41,900 tons of billets, but it was said that the producers were unwilling to quote a price low enough to interest the Belgian inquirers. Among the few English inquiries noted in the market were those for 200 tons of sheets, 60 tons of varnished wire and 30 tons of barbed wire. Among the recent sales made to England were 750 kegs of nails and 6000 reels of wire. Italy has sent in an inquiry for 2000 tons of pig iron, 2000 tons of plates and 1000 tons of sheets.

Spain Curtailing Purchases

Spain also is curtailing her purchases of iron and steel here. During the immediate past quotations have been made to Spain on 2000 tons of pig iron, 1000 tons bars, 3000 boxes of tin plate, 350 tons of brass and a small tonnage of steel plates. The export house curtailed its commission to 2 per cent, but the Spanish prospects said the prices were too high and refused the offer.

A great volume of wire has figured in the sales to South America. Argentine has closed order for 32,000 reels of galvanized wire, 50 tons of plain wire, 1000 boxes of tin plate, 10,000 reels of galvanized barbed wire, 85 tons of rivet wire, and 2000 coils of varnished wire. Sales of 600 reels of plain wire and 40 tons of nail wire to Montivedio were reported. Typical of the type of business that is being done generallly with South America were the sales of 60 tons of tubes and 200 cases of tin plate sold there by one house during the past week. There have also been sales of tin plate, sheets, nails, wire and similar products to Central America.

One house reported the sale of two carloads of tubes and 10 tons of copper to Australia. Some heavy shafting and plates have been purchased for the sugar industry in Hawaii, the latest order closed being for approximately 500 tons. Hawaiian sales also include sheets and nails. Among the sales made to the Philippines were 4000 reels of barbed wire, 200 tons of galvanized sheets and 300 tons of light rails. Exporters have also sold 6000 kegs of nails and four carloads of pipe to the Dutch East Indies.

One house reported the sale of 400 tons of wire rods, 50 tons of shafting, 40 tons of zinc, 120 tons of hoops, 2200 cases of tin plate and 3000 kegs of nails to China. This same house sold 50 tons of hoops to Japan and 800 cases of tin plate to Manchuria.

The strike of the longshoremen at the port of New York, which may spread to other ports, has been giving the exporters considerable trouble. Little shipping has left this port for the past week or so and the longer this strike continues the more uncertain are the exporters about future conditions.

The railway equipment manufacturers have made progress with their foreign equipment finance corporation. It was announced that this corporation will have a capitalization of $100,000,000 and will soon be ready to extend credits to all those countries which are in need of railway equipment. Each of the equipment manufacturers entering into the financing corporation, it is understood, will subscribe $5,000,000 to the capitalization. Several representatives of American equipment companies are already in Europe and the field there has been under careful observation. It is generally agreed that Europe's needs will be great and already several large orders are pending. One of these is for 400 locomotives for the Belgian government. There is another order in sight for 20,000 cars. The placing of these is awaiting credit arrangements.

Big Meeting Promised

Indications point to a large attendance at the sixteenth general meeting of the American Iron and Steel institute to be held at the Hotel Commodore, New York City, on Friday of this week. Acceptances for the banquet Friday evening which will be addressed by prominent figures in the iron and steel and industrial world, some of them of international renown, have been unusually large in number.

Steel Bids Uniform

Washington, Oct. 21.—Bids on 10,500 tons of plates, 3400 tons of shapes and 15 tons of bars each for battleships No. 51 and No. 52, were opened last week by the navy department disclosing the following prices offered: Carnegie Steel Co., 2.50c, plates; 2.45c, shapes, and 2.35c, bars; with the Midvale Steel & Ordnance Co., the Bethlehem Steel Co. and the Phoenix Iron Co. bidding at prevailing market levels.

Steel Strike is Nearing the End

Good Progress is Made by Furnaces and Mills in Districts Where Strikers Were Most Strongly Organized—Men Now Returning at Cleveland and Youngstown —Pittsburgh Agitators Lose Injunction Suit

STEADY progress toward a resumption of normal operations of blast furnaces and steel mills is reported in those districts in which the strikers were most strongly fortified, a development encouraging employers to believe that the strike is near an end. In the Youngstown district, the Youngstown Sheet & Tube Co. has every department working except its puddling mills, while at the Ohio works of the Carnegie Steel Co., 90 per cent of the American-born workers of foreign parentage have returned, as well as a large percentage of the foreign-born workers. The Trumbull Steel Co. has increased operations. Many instances are cited by employers in the Youngstown district where pickets have deserted their posts and returned to work.

In the Cleveland district, where the strikers were considered particularly well organized and where city authorities have been especially favorable to their cause, operations are showing increasing activity as more men continue to return. The McKinney Steel Co. is operating one of its four blast furnaces, two of its 14 open hearths and its blooming mill, and also is running partially its by-product plant. The Cleveland Furnace Co. is operating one of its furnaces

In the Pittsburgh district strike conditions are constantly growing better The strikers were defeated in an injunction suit which they instituted against Pittsburgh officials to compel the latter to issue them permits to hold organization meetings in certain areas. The more radical groups of foreign laborers are not being re-employed, although applying for reinstatement.

Two of the three mills in the Buffalo district are planning to operate this week on an extended scale. The Lackawanna Steel Co. has increased its force to between 2500 and 3000 men and is operating a blast furnace and certain open-hearth and mill units. The organizers sent 600 pickets to this plant but the police believed that number too large and dispersed them. The Donner Steel Co. is planning to resume operations Oct. 22.

In the southern and eastern districts the strike is virtually at an end, and the situation in the Chicago district also is reported to be much improved.

Prospects of a coal strike Nov. 1 are not considered alarming in the steel industry, although the steel strikers claim this will assist them. The coal supply is said to be ample for 90 days' requirements.

Pittsburgh Strikers Lose Injunction Suit

PITTSBURGH, Oct. 21.—Little outward evidence that a strike exists against the steel plants is at hand in Pittsburgh proper, where the fortunes of the labor organizers have fallen so low that they lately have been obliged to resort to lawsuits. The authorities at Pittsburgh like those in the state of Pennsylvania believe in law and order and it has been the policy of the mayor of the city to refuse permission for labor meetings to be held in those parts of the municipality that are considered as strike areas. Labor interests recently sought an injunction against the city officials to restrain interference with their meetings. The injunction has been refused.

Outside the city, except for occasional outbreaks brought about by the interference on the part of strikers with men on their way to and from the plants, conditions are steadily growing better. Not a plant in the district which was affected by the walkout four weeks ago has failed to maintain and extend the recovery which began to set in during the second week of the trouble. In every plant more men are back at work than at any time since the first few days of the strike period. Few American workmen went out and most of them are back. Foreign labor has stayed out to a considerable extent, and a large number of them are out of the steel plants for good.

Disclosures of Attorney Jacob Margolis, who claims to represent the I. W. W. in Pittsburgh, before the senate committee on education and labor in Washington with regards to activities of the Russians at Homestead, not a few of whom had been employed by the Carnegie Steel Co., and who lately have been trying to go back to work, have established a barrier against their employment in the plant of this company. Because of the foreign character of the strike the belief is growing among steel company officials that a protection against a recurrence of the present trouble will be found in the employment only of Americans, either native or naturalized.

Little fear is entertained among the steel manufacturers that a strike of the coal miners on Nov. 1 will have any effect on the steel situation. Despite the feverish buying of coal which has been in progress the past week or ten days it is reliably stated that visible supplies are sufficient for 90 days at least and it is believed that if the coal miners cannot win in a month they cannot win at all.

McKinney Steel Co. Begins Plant Operations

Cleveland, Oct. 21.—Although more iron and steel plants in this district announced their intention to resume operations Monday so few men reported at most plants that officials did not consider it wise to attempt operations. Employers, however, say the number of strikers asking for reemployment is increasing steadily. Approximately 472 men are working at the H-P nail works of the American Steel & Wire Co., and officials of this company state large numbers of men have asked to be re-employed at the other plants of the company.

One plant of the Otis Steel Co. is operating on practically a normal basis, while the company's Lakeside works is operating partially. Between 300 and 400 men have reported for work at the plant of the Upson Nut Co. The McKinney Steel Co., the largest independent producer in

the district, has resumed operations on a partial basis. One of the four blast furnaces, two of the 14 open-hearth furnaces and the blooming mills are operating. The by-product coke plant is also working on a partial basis.

Officials of the Union Rolling Mill Co. planned to open the plant Tuesday, but the number of men reporting was insufficient. Many men have reported at the Lake Erie Bolt & Nut Co.'s plant, but so far this company has not resumed operations.

One blast furnace of the Cleveland Furnace Co. has resumed operations.

Attempt to Call Out Ore Miners Fails

Duluth, Minn., Oct. 21.—The ore miners' strike in the Ely district is proving to be a failure. The North Chandler mine is now working with a full crew and two other mines that were closed are working with reduced crews. Agitators' efforts at other mines have fallen flat. The Minnesota Steel Co.'s plant here is operating normally.

More Furnaces and Mills Busy in Chicago District

Chicago, Oct. 21.—Continuous improvement is made in the steel strike situation as more men return to work. Percentages of operation are difficult to state as the forces have been disorganized, and it is slow work building up again for efficient operation.

A sharp contrast is presented in this district, showing plainly that intimidation is the most effective means of continuing the strike and that where this is at a minimum men return to work. In Indiana, including Gary and Indiana Harbor, the presence of federal troops has served to maintain order and workers have returned to their tasks in large numbers. In some cases the mills have been unable to accommodate them as fast as they have applied, the men being forced to wait until the next day before being assigned. Mills in these places are operating at a high rate.

In Illinois, including South Chicago and its environs, the only protection is the city police and deputy sheriffs, all political appointees, and the strikers have free rein. This situation is retarding resumption of operation.

Both Gary and South works of the Illinois Steel Co., have increased blast-furnace and open-hearth operations and have put additional rolling mills into service. The By-products Coke Corp., has been able to light part of its ovens and has blown in one stack at Federal furnace. The Iroquois Steel Co., has lighted one stack and will light another shortly. Production from these sources is small because of difficulties in getting them under way after being cold.

Most Americans are back at work, while few of the foreigners who do not speak English have returned. The latter depend on the labor agitators for their sources of information and are given garbled reports designed to keep them out. The strike has been definitely lost by the strikers and the remainder of the struggle is simply a wearing-down process until all the men are back at work or their places filled by others.

More Activity is Noted in Mahoning Valley

Youngstown, O., Oct. 21.—Throughout the Mahoning valley iron and steel plants gradually are being steered into productive channels again. More activity in concerted steel-plant operation was witnessed Monday and Tuesday than at any time during the past five weeks. At the Ohio works of the Carnegie Steel Co. this week more than 90 per cent of the American-born employes together with many of the foreign-born workmen entered the mill gates, according to an authorized statement issued by the officials. About 100 more men than was noted one week ago returned to work Monday. The Ohio works now has one blast furnace, a bessemer converter which was dried out Sunday night, two open-hearth furnaces and the blooming mill in operation. Further plans point to the starting of the McDonald bar mills this week.

The Youngstown Sheet & Tube Co. now has every department of its East Youngstown plant working with the exception of the puddling mills. The largest number of men returned for works at this plant than at any other plant in the Youngstown district. Further down the valley at Lowellville, O., two open-hearth furnaces at the plant of the Sharon Steel Hoop Co., are being tapped regularly. Officials of the company expect to start as many sheet mills as possible this week. An increase in the number of men returning to work at this plant Monday particularly was noticeable.

No. 4 blast furnace of the Republic Iron & Steel Co. continues to operate and plans now are formulated to turn the blast on an additional stack toward the week end. At its Haselton plant four open-hearth furnaces are making steel as compared with two last week. The finishing mills at the Brown-Bonnell plant of this company still are at a standstill. The bar mills of the Republic company at Moline, Ill., now are rolling double turn.

Considerable increase in activities is noted at the plant of the Brier Hill Steel Co. Six open-hearth units as compared with three a week ago, are producing steel. Five of these were operating Monday while the sixth unit was charged Tuesday when the morning shift went to work. One blast furnace supplies the open hearths with hot metal. The coke ovens and the blooming mill were placed in action last week. The larger of the two plate mills at Mosier, about two miles north of the main plant, continues to roll its product.

In the upper part of the valley the Trumbull Steel Co. has five of its seven open hearths making steel; the blooming, bar and strip mills rolling; and its sheet, tin plate and terne plate departments working the usual 8-hour turns. This plant now is operating normally, the workmen having returned to work about 10 days ago under the same conditions which existed before the walkout.

The Industrial Association of Traffic Managers held a meeting in Pittsburgh last Tuesday to consider the question of car demurrage which now is confronting all steelmakers effected by the present tieup. A committee wa appointed to wait on Director General Hines in order to come to some agreement as to the legitimacy of the charges under the present strike conditions. This committtee will hold a consultation with Mr. Hines in Washington Thursday.

Buffalo Mills Planning to Operate on Large Scale

Buffalo, Oct. 21—After a month of comparative inactivity among the three steel plants in this district, two of the mills are planning to resume operations on a large scale. The Lackawanna Steel Co. has augmented its force to the extent of 2500 to 3000 men, and now has in operation a blast furnace and certain open-hearth and mill units. The company states operations are being increased and men are being re-employed as fast as they apply for work. Strikers attempted to put a force of 600 pickets at the plant Monday, but these were dispersed by the police, who declared that the number was excessive.

The Donner Steel Co. proposes to resume operations Wednesday. Men are being steadily taken back at this

plant and Tuesday it was said that about 800 men were at work. A certain percentage of this number was busy all last week on general work. No attempt is being made to operate the Rogers, Brown Co.'s plant at Lackawanna, in accordance with the statement made Sept. 23 that the plant would not be operated until the entire 600 men return. Attempts to force a strike at the Buffalo Union furnace have met with failure, and the Wickwire Steel Co., and the Donner Tonawanda furnaces continue to operate at capacity.

Embargo Placed on Shipments From Boston

Boston, Oct. 20.—The effect of the steel strike, at first entirely unnoticed in New England, is now beginning to be felt in many localities and in many markets. Plants of the United States Steel Corp. in Pennsylvania and Ohio have been in most cases placed on the embargo list for shipments from Boston, Worcester and several other New England points. The continued idleness of most of the Buffalo foundry iron furnaces has inconvenienced many of the foundries in this district, particularly in Vermont and New Hampshire, where in some cases an actual exhaustion of the supply has been reported.

Form Export Combination in Foundry Equipment

For the group development of the foundry equipment export trade under the provisions of the Webb act, the Foundry Equipment Export Corp. has been organized to engage in the sale of all kinds of foundry supplies, equipment and accessories required by casting manufacturers. The corporation has been incorporated under the laws of Delaware with a capital of $50,000. A temporary office has been established at room 114, 40 Wall street, New York. The following companies are stockholders of this export corporation:

American Foundry Equipment Co., New York; Grimes Molding Machine Co., Detroit; Arcade Mfg. Co., Freeport, Ill.; American Molding Machine Co., Terre Haute, Ind.; S. Obermayer Co., Chicago; Buch Foundry Equipment Co., York, Pa.; National Engineering Co., Chicago; E. J. Woodison Co., Detroit; J. W. Paxson Co., Philadelphia; Whiting Foundry Equipment Co., Harvey, Ill. Officers of the Foundry Equipment Export Corp. follow: Col. T. S. Hammond, Whiting Foundry Equipment Co.,president;L. L. Munn, Arcade Mfg. Co., first vice president; E. J. Woodison, E. J. Woodison Co., second vice president; V. E. Minich, American Foundry Equipment Co., treasurer; and S. T. Johnston, S. Obermayer Co., secretary. The executive committee consists of R. S. Buch, Buch Foundry Equipment Co.; V. E. Minich, G. L. Grimes, Grimes Molding Machine Co.; S. T. Johnston and the president. Alba B. Johnson Jr., Morris building, Philadelphia, has been engaged as manager of the corporation. Headquarters probably will be established in London soon for European operations.

Gompers Resolution Voted Down

Public Group in Industrial Conference Joins Employers in Opposing Arbitration of Steel Strike, and Also Votes Against Resolution for Collective Bargaining—Union's Demands Considered Autocratic

WASHINGTON, Oct. 21.—The public group in the national industrial conference tonight sprung a surprise and joined the employers' group against labor, voting down both the Gompers' steel strike resolution and the resolution in favor of collective bargaining. One week ago, when the employers engineered a movement to delay a vote on the Gompers' resolution, the public group stood with the labor group, but after a strenuous week devoted to considering compromise suggestions the public group by a majority vote deserted labor. This is expected to have a decidedly beneficial effect upon the public generally in the present steel strike. Had the vote been taken a week ago the result would undoubtedly have been the reverse.

Full explanation of why the public group, of which Judge E. H. Gary is a member, voted with the employers is lacking, but from a statement made by Thomas L. Chadbourne, of the public group, on the floor at the close of the session Tuesday night, it is believed one of the 12 demands of the steel strike committee in regard to abolition of shop councils and labor organizations, other than trade or labor unions, led to the public group's action. Most of those in the public group were under the impression labor would interpret the term "collective bargaining" in its broad sense, but, confronted with labor's interpretation in the form of the steel strikers' demands, it is believed the members saw the evils of unionism as voiced by Judge Gary.

Judge Gary's address Monday afternoon, towether Samuel Gompers made a weak and ineffectual reply, together with the conference decision on collective bargaining was of sufficient force to change the public group's vote on the strike resolution. Before these votes were taken Tuesday night, amendment after amendment was voted down, two to one.

What effect the action will have on the future of the conference remains to be seen. The conference will resume work Wednesday, at which time labor will probably make known its decision as to whether it will leave the conference or remain. If the members of the group decide to quit Chairman Lane will read a letter from President Wilson in which it is understood the President pleads for continuance of the conference until a solution for labor troubles is found. If the conference goes forward, as it is expected, it is apparent different tactics will be employed by labor.

Before adjournment Tuesday night chairman Lane suggested what is generally accepted as the best plan. That is to have an adjournment for 10 days or two weeks, during which time properly constituted committees may frame a definite program so that when the conference reconvened the program can be taken up in detail. Had this procedure been adopted at the start and had Samuel Gompers waited with his resolution to arbitrate the steel strike it is believed the conference would not have spent two weeks in considering it. It is argued by some officials that the results so far demonstrate that present industrial disputes will not be arbitrated by the conference, nor will it be stampeded into adopting industrial principles without labor frankly stating its position, and being willing to accept the interpretation of such phrases as collective bargaining, the 8-hour day, etc.

Analyzes German Iron Practice

Saar Coal Alone is Not a Strongly Coking Coal and is Unsuitable for Transportation—Most Blast Furnaces are Equipped With Two Rows of Tuyeres—Few Steel Shells Used

SHORTLY after the armistice was signed, the British minister of munitions appointed a commission to visit the steel works in Lorraine and in that part of the Saar valley occupied by the French authorities. Special attention was paid to the character and extent of the technical and other developments which took place during the war; to present conditions of plants and machinery; to the prospect of these areas either as competitors with, or market for, British industries; and, to the developments in fuel economy in the steel trade of these areas.

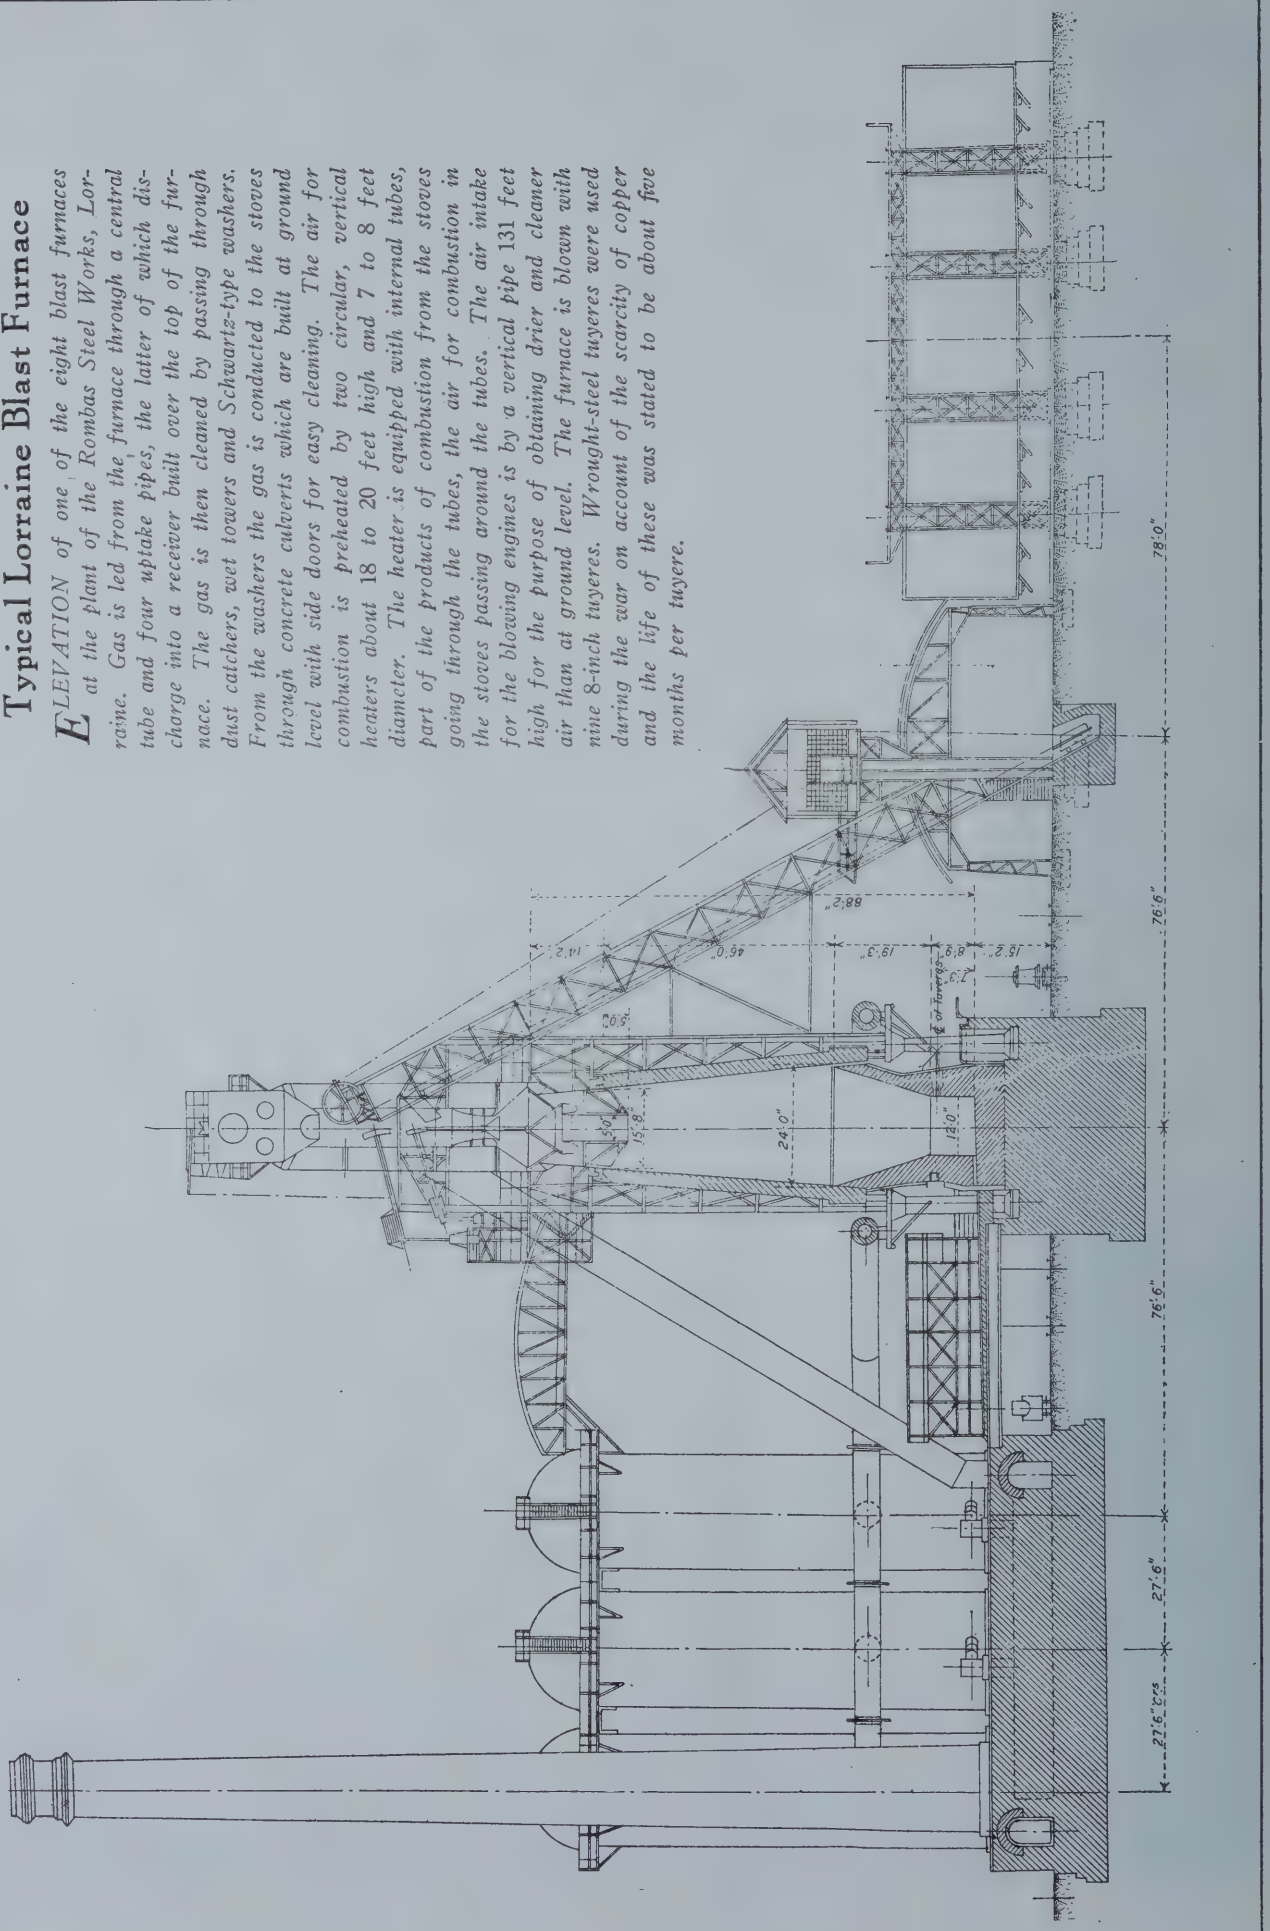
The report made by this commission, a summary of which appeared in the Sept. 18 *issue of* The Iron Trade Review, *contains brief descriptions of the plants investigated in Lorraine, in the Saar valley and in the Cologne district, and from the detailed information thus given it has been possible to gain a general idea of the methods employed by the Germans in operating the blast furnaces in these areas. While not differing radically from American or British standards, German practice embodies a number of features which merit attention. Tendencies observed by the commission indicate that iron and steel works managers in the districts visited have attempted to effect economy by concentrating furnaces, rolling mills and accessory departments of a plant on one site and by using washed blast furnace gas in gas-driven prime movers to generate electric energy and to provide air for furnaces. The utilization of cleaned gas was particularly noticeable in large central stations where* 10, 12 *or more gas engines of from* 1500 *to* 5000 *horsepower were installed.*

Most of the modern furnaces in the districts visited are smaller than the latest American stacks, and have about half the capacity. The blast pressure in European furnaces is much lower than that used in the United States and the tuyeres are larger. The arrangement of the gas off-take from the furnace, and the operation of the stoves differ from American practice.

PRACTICALLY all the pig iron produced in the Lorraine district is used for basic-steelmaking. The iron ore is obtained from the Lorraine deposits, most of the steel companies owning their own mines. The distance between the iron and steel works and the mines varies, but in no case exceeds 11 miles. A few of the works are built near the mines.

The ore is brought to the works by means of aerial ropeway; in few cases it is brought by electric or steam locomotives to the storage bins. Materials are delivered to the furnace top with a minimum of handling, many of the modern plants being provided with Pohlig-type hoists. The average cost of the ore delivered into the blast furnaces in Lorraine is about $1.54 to $1.74 per ton. The iron ore in the district is of two qualities, calcareous and siliceous, a self-fluxing mixture of these being used. The average analysis of these ores, which are used extensively, follows:

	Calcareous	Silicious
Iron	25 to 30	26 to 35
Lime	18 to 20	5 to 7
Silica	7 to 8	15 to 20



All the Saar valley plants obtain their ore by rail. Some of the companies have their own mines, others having to purchase the ore they require. The cost of mining the iron ore in Lorraine is becoming greater by reason of the fact that mining is necessarily at constantly increasing depths. Little ore is now obtained

POHLIG CHARGING APPARATUS AT THE PLANT OF THE GUTEHOFFNUNGSHUTTE AT OBERHAUSEN, GERMANY

Typical Lorraine Blast Furnace

ELEVATION of one of the eight blast furnaces at the plant of the Rombas Steel Works, Lorraine. Gas is led from the furnace through a central tube and four uptake pipes, the latter of which discharge into a receiver built over the top of the furnace. The gas is then cleaned by passing through dust catchers, wet towers and Schwartz-type washers. From the washers the gas is conducted to the stoves through concrete culverts which are built at ground level with side doors for easy cleaning. The air for combustion is preheated by two circular, vertical heaters about 18 to 20 feet high and 7 to 8 feet diameter. The heater is equipped with internal tubes, part of the products of combustion from the stoves going through the tubes, the air for combustion in the stoves passing around the tubes. The air intake for the blowing engines is by a vertical pipe 131 feet high for the purpose of obtaining drier and cleaner air than at ground level. The furnace is blown with nine 8-inch tuyeres. Wrought-steel tuyeres were used during the war on account of the scarcity of copper and the life of these was stated to be about five months per tuyere.

by open workings. Moreover the miners are agitating for shorter hours and increased pay; at present a good average miner earns $4.83 to $5.80 per day. It was stated that during the war the Germans used liquid air in some of the iron-ore mines of Lorraine in place of explosives for blasting purposes.

It is true that Germany will want iron ore from Lorraine (in 1913 she took 14,000,000 tons from Briey and 18,500,000 tons from Lorraine) but she will not be so entirely dependent upon this one source of supply as the Lorraine works will be upon Germany for coke, unless some means are provided to enable Lorraine to obtain coke from elsewhere, or to produce her own needs from Saar coal and imported coking coal.

If coke could be brought from Westphalia to Lorraine by part rail and part water the cost of transportation would be reduced considerably, but the opinion is expressed generally that the extra breakage to the coke would more than offset any such saving. The use of Saar coke alone is nowhere favored, and is regarded as more wasteful in the blast furnaces on account of its physical qualities than Westphalian coke at the higher cost. The cost of Westphalian coke at the ovens was about $11.58, and the transportation charge $2.32 making the delivered price $13.90 per ton at the furnaces. In the Saar valley the cost of basic iron production was given as $72.59.

Operation Depends on Coke Supply

The blast furnaces and steel plants in Lorraine, and to a lesser extent in the Saar valley, are dependent on supplies of coal and coke from Westphalia. The Germans have failed to carry out their obligations, under the terms of the armistice, to supply a specified quantity of suitable coke, which was the immediate cause of all plants in Lorraine being partially operative. The entire dependence of all the Lorraine iron and steel works upon Germany for fuel supplies, places them in an unenviable position. At the time of the investigation none of the blast furnaces were in full operation on account of the acute need of coke. Only five of the 60 blast furnaces in Lorraine which were found to be in good condition at the date of the armistice, were in operation. The total number of blast furnaces in Lorraine is given as 68.

The French authorities have had as many as 27 or 28 furnaces in blast at one time since they recovered Lorraine. The furnaces, however, were operated slowly on account of the shortage of coke. In most cases, the stacks are designed for the production of basic iron from the phosphoric iron ores of the district. In nearly all cases a basic-bessemer steel works is attached, the necessary power for operating the works being obtained from the blast-furnace gas. Where no steel works is at present established in connection with a blast-furnace installation, the surplus gas is used in large gas engines for supplying power to Metz and the villages in the district.

The great and successful development in the manufacture and operation of large gas engines on low-powered gas enables complete utilization of the blast-furnace gas to be effected. After rough cleaning part of the gas is used for heating the blast-furnace stoves (in no case was dirty gas being used for the stoves), and under boilers, the remainder after further cleaning being used for driving large gas engines installed for blowing purposes and for power generation, the former serving the blast furnaces and basic-steel converters, and the latter providing the power for the rolling mills, cranes and the plant generally.

At plants where the gas for the stoves was wet-cleaned, it was common practice to run a stove on gas from six to nine hours after a blast of two hours and a temperature drop from 150 to 200 degrees Cent. At plants where the stove gas was dry-cleaned the temperature drop of the stoves was reduced considerably, owing to the more frequent changing of the stove from gas to blast. A lower coke consumption per ton of output seemed to be generally obtained, and the total gas consumption at the stoves per ton of output to be reduced. On the new furnace under construction at Rombas arrangements were being made to preheat the gas for the stoves after dry cleaning by a Holberg-Beth type plant. At other works some of the stoves are equipped with blowers to supply the air for combustion under pressure in order to reduce the time otherwise required for the gas.

Nearly all the blast furnaces are brick built and banded. Few have steel shells either in the Lorraine or Saar districts, only those at Hagondange, Joeuf, Homecourt and Hayange being so constructed. Nearly all the furnaces are equipped with bosh tuyeres up to 6 inches diameter. Some have carbon linings in the bosh and hearth. The composition of the burden varies at different works according to the qualities of the respective ores used, but in general in proportion of about two to three of calcareous to one of siliceous. The iron content of the ore mixture runs from 27 to 33 per cent. An output of 200 tons per 24 hours is commonly obtained from a furnace 70 feet high with a hearth 13 to 14½ feet diameter; the pressure of the blast required being about 6½ to 7½ pounds per square inch.

The average analysis of the basic pig iron produced is as follows:

	Per cent
Silicon	0.6 to 0.8
Manganese	1.2 to 1.4
Sulphur	0.06 to 0.07
Phosphorous	1.8 to 1.9

The average analysis of the furnace coke used is:

	Westphalian	Saar
Sulphur	1.3 to 1.8	0.7 to 1.0
Ash	13.0 to 16.0	14.0 to 17.0

Coke Required Per Ton Iron

The consumption of coke per ton of pig iron produced varies from about 2425 to 3000 pounds at present, but before the war the coke figure was generally around about 2425 to 2645 pounds per ton of iron. Most of the blast furnace plants are equipped for running the hot metal to the mixers. The pig beds are under cover and are served with combined magnets and pig-breaking cranes. The week-end iron is usually cast in chills. Several blast-furnace plants were visited and

Cost of Pig Iron in Germany

Cost of Pig Iron Per Ton at Krupp's Rheinhausen Works as Estimated by the Belgian Economic Commission and Based on Normal Rate of Exchange

	1914	Oct., 1918	Feb., 1919
Coke	$3.81	$10.47	$25.23
Ore	$7.62-$7.85	$16.66	$32.13
Wages	$0.36-$0.48	$0.95	$2.14
Overhead charges	$0.83-$0.95	$1.40-$1.91	$3.57
Total	$12.61-$13.09	$29.51-$29.99	$63.07
Price of pig iron	$14.28-$15.47	$30.94-$33.32	$52.36
Price of coke	$3.57-$4.05	$9.52	$20.71
Price of ore—			
Minette	$1.67-$1.90	$3.33-$5.95	
Lahn	$2.62-$2.86	$6.43	
Biber	$3.09-$4.05	$6.90	
Swedish phos.	$3.57-$3.81	$15.47-$16.66	
Swedish nonphos.	.....	$17.85-$19.04	
Price of limestone	$0.83	$1.19-$1.31	

their respective practices inspected.

The Rombas Steel Works, Rombas, Lorraine, receives its supply of hot metal from the blast furnaces at Maizieres, a subsidiary plant, 7 miles distant. The two plants are connected by a private railroad. The Maiziere plant includes six blast furnaces, each of which produces 250 tons of metal per day. A new furnace, which will have eight 7½-inch tuyeres in the main row and eight 4-inch tuyeres in the bosh, is now being constructed. Each stack is equipped with four stoves, each stove being on blast three hours continuously and nine hours on gas continuously. Manganese ore for use at this plant was obtained prior to the war from India and the Caucasus. The practice at present, however, is to use spiegel slag to the extent of 10 per cent of the ore charged, having manganese content from 7 to 10 per cent. The officials at this plant stated they found it good practice to operate turbines in step with the gas engines for generating power, as by this means the load is kept more constant. The Rombas Steel Works prior to the armistice was known as the Romback works and was owned by German interests. It is now under the jurisdiction of the French, M. Barbier having been appointed director by the French government. This plant includes eight blast furnaces, an elevation of one of which is shown on page 1106. On the older stacks eight 8-inch tuyeres convey the blast into the furnace while the new one is equipped with nine tuyeres of the same diameter. No bosh tuyeres are used at this plant. The officials stated that wrought-steel tuyeres were used during the war when copper was extremely scarce, each tuyere lasting from four to five months. Stock is hoisted to the furnace top by means of the Pohlig bucket system, modified to a certain extent. At the time the commission visited this plant coke breeze instead of sand was being used for making up the pig beds. The beds were under cover and equipped with a magnet crane and a pig breaker.

At the Carlshutte furnaces, near Thionville, Lorraine, the commission found that in the No. 2 power house there was intended to be installed on foundations already erected a number of large new gas engines which were stolen from the French and Belgian works during the war. The engines were lying on the ground but not erected. The plant and machinery stolen amounted to 13,000 tons, valued at $13,510,000, and included all the structure and equipment for a complete steel works. It covered the whole site of the new steel works and lay along the sidings for a great distance. The proprietor of these works is now serving seven years for receiving this stolen property.

The small furnaces at the Volklingen Steel Works, Volklingen, near Saarbrucken, which are about 74 feet high, are typical of Saar district practice. A cross section of a furnace of this type is shown on this page. Higher furnaces are not advocated in this locality. Ore and coke are supplied the furnaces by inclined skipways from opposite sides of the line of furnaces but at one end, then along the line of, and around each furnace bell by monorail. The skips are moved by an independent motor on each skip carriage. An automatic electric block system is installed in order to prevent the over-running of individual skips. The block system is operated from a signal box by a single workman stationed on the top staging, who earns $2.62 per turn of eight hours.

Cross section of No. 3 stack at the plant of the Volklingen Steel Works, near Saarbrucken, Lorraine. Blast furnaces over 74 feet high are not advocated in the Saar valley

At the top of the furnace one man unlocks the balanced skips, empties the charge into the hopper and relocks the skips. This arrangement works fairly well, but is complicated, and appears to be more costly than if independent skip inclines were installed for each furnace. The top runways were at the level of the highest furnace and separate lifts from this level were provided to handle the skips required for the furnaces at lower levels. The skips were operated electrically around the bells of the lower furnaces. The coke consumption at these furnaces averaged 3307 pounds per ton of iron. Each stack was equipped with a central gas offtake at the top, as it usual in this district. At the blast furnace plant of the Dillingen Steel Works, Dillingen, near Saarbrucken, the stacks are built at 164-foot centers. Ore and coke are raised to the tops of the furnaces by means of inclined ropeways which carry tipping skips. Each stack has an ore ropeway on one side; each pair of furnaces is served by one coke ropeway on the opposite side of the furnaces. The skips when hoisted are moved around each furnace bell independently on monorails, the system being similar in certain respects

with that at Volklingen. One man is stationed at the top of each furnace. The management did not consider the arrangement as satisfactory as the bucket hoist.

On one of the blast furnaces, which was being relined, at the Burbach Steel Works, a row of cast-iron cooling plates had been built in between the main row of tuyeres and the bosh tuyeres, thus forming a continuous circle of cooling plates around the furnace. These plates were made by serrated bent wrought pipes cast into shaped plates. Wrought-steel tuyeres were used and it was stated that their life was from five to six months. Plans, however, were to return to copper tuyeres as soon as conditions permitted. The cast-steel hearth jacket on this furnace extended about 5 feet below the bottom of the hearth. During the war the officials of the company blew in one stack on ferromanganese, using Spathic ore obtained in Germany. This ore was said to contain from 12 to 15 per cent of manganese.

The Neunkirchen Steel Works, near Saarbrucken, makes its coke from Saar coal altogether and before the war was the only works in the district using Saar coal unmixed for coking purposes. The six stacks of this company are banded instead of jacketed. Under normal conditions, it is stated, 10 years service was being obtained from each furnace lining. However, this is not unreasonable when considering that the furnaces are worked on a blast pressure of but 7½ pounds per square inch. At these furnaces as at all others, with the exception of the stacks at the Hayange and Hagondange works, the gas is led from the top through a central out-take.

Nearly every place visited has a slag-brick plant installed. The bricks are made in machine presses, each press producing about 10,000 bricks per 24 hours. About 5 per cent of lime is added to the granulated slag to act as a binder and the mixture remains for 24 hours before being pressed. The bricks are then air dried. They are in large demand in the district for building purposes. Before the war the sales price at the works was about $4.28 to $4.76 per 1000; at present it is $11.58 to $12.55 per 1000.

At Hagondange in Lorraine, the cost of making basic pig iron was about $38.60 per ton made up of $5.79 for iron ore, $20.27 for coke and $12.55 for labor and other items.

It becomes questionable if the blast furnaces in Lorraine and Saar districts will in the future be able to produce basic pig iron at a lower cost than it can be made in England, for while these areas may be better located as regards ore, they are much worse located as regards fuel.

Hopes Are Blasted

PRIOR to the war German steelmakers frequently complained of the difficulty of obtaining adequate supplies of foreign ores, which was one of the chief causes of the war, as they hoped thereby to obtain possession of France's ore reserves. Due to the result of the war France has replaced Germany as the possesser of the largest iron-ore supplies in Europe, France's reserves having been increased by over 2,000,000,000 *tons, making them now about four times those of Germany. Before the war they were about the same. With France's new possession of Lorraine and the Saar valley she is in position to produce* 11,000,000 *tons of pig iron annually. In* 1913 *France's production of pig iron was about* 5,000,000 *tons.*

Making Chains for the Panama Locks

FOR the fenders for use in the locks of the Panama canal, 24 chains were required, with a total length of 10,500 feet, and a total weight of 500 tons. These chains were made of 3-inch, wrought-iron bars, and their manufacture taxed the chainmaking facilities in the United States for over a year. Some details of the construction and tests of these chains recently were presented in a paper by Henry Goldmark, before the Western Society of Engineers.

From tests, the diameter of the links for the fender chains was fixed at 3 inches and the working load at 220,000 pounds. Upon investigation the fact was disclosed that few plants in the United States had either experience or equipment necessary for making chains as large as 3 inches. The order for the 24 chains was therefore distributed among many private works throughout this country and England, and the plant of the United States navy yard at Boston was immediately set to work at its full capacity in the manufacture of these chains.

The first chain received at the Panama canal was made in the navy yard. When tested throughout its full length by a pull from a large winding machine, it broke at a defective weld, under a stress of about 220,000 pounds. In view of this weakness the broken chain was returned to the United States for further investigation and the whole question of chain design and manufacture was again considered. The returned chain was cut into two sections, each 35 feet long. One of these was carefully annealed and both were tested under similar conditions. The break in both cases occurred at a defective weld, and indicated little or no affect due to the annealing. In view of these results four test chains, 50 feet long, were ordered, and the manufacture of these was carefully guarded and supervised to attain the highest grade of chain.

Double-refined iron, entirely free from scrap, was specified. The links of two of these chains which were made by the navy department were end welded, whereas, the links of the other two, which were made by a private concern, were side welded. Tests of these four chains showed an average breaking strength of 514,000 pounds, with minimum breaking strength for one chain of 440,000 pounds with satisfactory results.

Under the specifications and after one and one-half years of endeavor, the 24 required chains were completed, and are now installed at the locks. At the time the Panama chains were begun the method of power-forging chains was not sufficiently perfected to warrant its adoption for such difficult work. However, at the Boston navy yard, the last six sections were made by this method with excellent results. The method in brief is as follows: the bar iron is cut by heavy shears into proper lengths, each length is then heated at one end and placed in an upsetting machine, which upsets and bends it at an angle of 90 degrees. In the same heat the scarf is put on under a 2500-pound steam hammer. On a second heat the other end is bent and scarfed in the same way. The next step is the bending of the link to its proper shape, after which end welding is done by means of two steam hammers, operated by compressed air. The last step is the heat treatment, and consists in heating the completed chain to about 1600 degrees Fahr. in an oil furnace and afterward carefully cooling it in air.

Promoting Safety in Steel Plant

Safety Engineer Must be Student of Human Nature and Capable of Winning Co-Operation of all Employes—Foreign-Born Workmen Can do Much, if Properly Coached—Experiences of One Company in Reducing Accidents

BY H. P. HEYNE

EACH establishment should have its shop discipline, but there are ways in which the employes can better inform themselves regarding what is expected of them, through the inauguration of a systematic program for conducting the work.

The new way to put safety across in any plant, is to meet the problems with a better understanding of affairs, and an assurance of fairness between the foremen and the employes, which should furnish the material for erecting the foundation for the co-operative spirit which the coming era is ushering in.

The two factors which bind men together are fellowship and good-will, based on mutual confidence. These are indispensable in attaining unity of purpose on the part of all for the welfare of all.

The spirit of co-operation brought about the desired results in the war. It will be found necessary to promote this same spirit in all lines of endeavor, and to direct our efforts toward minimizing the economic loss by teaching the elimination of waste and increasing human efficiency, which may be accomplished through advancing the average man's ability.

Men Must Trust Each Other

We are entering into a new age, and our advancement depends on enthusiasm and co-operation in industrial, social, and spiritual activities. We must eliminate all forms which may not be in accordance with what is just and of good repute. Not until we can trust each other without being skeptical, shall we have made a great stride in the progress of humanity. A truthful person, one who can be trusted under all circumstances, surely is an asset to any community.

We should unite and maintain the forces of progress as they were united in war, and stand for construction and development of world welfare against demolition and retrogression. We are living today in a changing era, and tomorrow will bring an advanced period in evolution, which means that more thought and action must be directed to the moral and intellectual side of life. The subject of living on a better and higher plane where all may come to a better understanding, should be taught and discussed, in private and public gatherings, so that the proper seeds may be sown in all directions and our efforts prove productive.

How Schools May Aid

We must get encouragement through our schools, for they are the greatest factors in the making of the future. Institutions of learning have devised ways and means for advancing education, through making studies interesting, and teaching as much as possible by facts. Pupils should be taught the right things in the right way, for many fundamentals have been neglected. There are many conditions today which might have been prevented had the persons been properly taught. It would not be amiss to direct our efforts to the end that all humans would be better and cleaner, through banishing all evil and destructive habits and customs. We have accomplished much through co-operation, fellowship, and efficiency; but there still remains a large area to be cultivated.

Let us not disdain nor ignore one another, regardless of our so-called station in life, for we are all members of the universal family, and should assist our less fortunate brothers.

In several departments where workmen have little or no knowledge of the English language, we appointed the more enlightened foreigners on mill safety committees, through an interpreter who explained to them just what was expected of members of the safety committee, and also that the safety committee button was presented to them in recognition of their ability in promoting safety among their fellow employes.

The committee button turned the trick, for the men felt that they were being considered, in assisting us in the work. The number of lost time injuries, those extending beyond balance of the working turn, was reduced 14 per cent for the first half of 1919 as compared with that for 1918, which was partially accomplished through getting the foreigners more interested in safety work. Our reduction in 1918 as compared with 1917 was more than 50 per cent. In other words, these fellows had a greater chest expansion. However, we made it clear that they must approach their fellows in a proper manner, otherwise they would not obtain their co-operation; and we made them feel that they were safety investigators and were considered a part of the safety organization.

The safety button is a badge of an accident preventionist, and must not be construed by the men as having any authority invested in them, other than to signify to their fellows that they are safety investigators. The button which, of course, was not presented until after the men had an understanding as to what was expected of them, had a good psychological effect.

The personnel of our workmen's committees up to June 30, 1919, was composed of foreigners to the extent of 12.6 per cent, and they have shown quite an interest in safety work. American members of our workmen's committees number 339, and foreigners, 49. Why should not the foreigners be considered the same as the Americans, for an injury is an injury, regardless of race, color, or creed? The foreigners are a part of our working force and should receive consideration at least to the point that they are human beings.

Interesting the Foremen

Accident statistics should consist of simple summaries and charts, which enable the executive, by brief reference, to know the present condition as compared with a preceding period. Without the records, it is difficult to determine the degree of progress.

We maintained records of injuries from different angles; including the classification by departments, occupations, and by foremen. The reports were furnished the foremen so that they could study conditions. The report indicating the injuries to men under the various foremen, shows at a glance the foremen's accident stand-

---

A paper presented at the eighth annual congress of the National Safety council, Cleveland, Oct. 3. The author, H. P. Heyne, is safety inspector, United Alloy Steel Corp., Canton, O.

ing, and gives one something to work from when approaching the foremen, by comparing the rates with others who have a better classification. This scheme created and maintained the competitive spirit among the foremen, and made them talk and practice safety.

One of the important duties of a safety engineer, is that of keeping the foremen interested in accident prevention work, which means the changing of plans from time to time, so that their enthusiasm may be maintained.

The safety engineer should always be on the alert for articles dealing with accident prevention, and to distribute the information among the department heads and on bulletin boards, as the dissemination of the proper kind of information will manifest itself in a manner whereby the safety movement will be further advanced and receive the recognition to which it is entitled.

The service bulletins, issued by the National Safety council, may be put to good use by distributing the messages among the foremen, as these bulletins may show up some of their weak points, and cause them to think.

We get our foremen to read the bulletins together with other material, by attaching a circular letter to the papers, which they sign and pass on to the one whose name next appears on the list. The file is returned to the office after having made the rounds. In other words, we have a record of the papers having been read, and the psychological effect which the signing has upon the foremen. In cases of instructions, we give each foreman a copy for his file.

Too much stress cannot be laid on that section of safety engineering which deals with accident investigations, as corrective measures or methods are the outcome of the results of the investigations if they are conducted in a thorough and impartial manner. Each accident involving lost time should be thoroughly looked into, together with injuries where no time was lost, but which might have been serious.

On the more serious cases, we interview each witness to the accident, so that we may get at the root of the trouble. The witnesses make affidavits to their statements before a notary in our department. The injured employe's statement also is taken, so that we have full information from both sides.

When the statements have been secured, a meeting of the investigating committee is called, which is composed of the department superintendent and foreman of the division where the accident occurred and the members of the safety teams. The information is gone over, whereupon the committee renders an investigation report, which is signed by the members of the committee. The report brings out the results of the investigation as to what or who was to blame for the accident, and makes recommendations with the view to preventing a recurrence.

A copy of the witnesses' statements and the committees' report is forwarded to the general manager, general superintendent, and department superintendent. A copy also is retained in the permanent files of the safety department.

The time consumed in drawing up statements in a business-like form, and attacking the accident from various angles is well spent, in that each case is recorded in a detailed manner for future reference; and the psychological effect, which the investigations have upon the men, in time results in a reduction of injuries, and an economic saving to the employer.

When a proposition is to be offered, it would prove advantageous to take the matter up with the persons concerned and invite their suggestions, for they might have something to offer which would prove practical and beneficial. At the same time their having been consulted would have a good effect on the men, which leads to co-operation in the work.

When a person is having a hard time and comes for sympathy, it is best to recognize his sufferings and find some word of encouragement. Then again, when one approaches with a message of his good fortune, try to share it with him in a sincere manner. This is human engineering, and will assist in a proper understanding and the binding together of individuals with a proper feeling and interest toward each other.

Supervisors should not criticize employes without first having made an investigation, and then it is not necessary to ride "roughshod" over them, but give them an opportunity for an explanation, as a correct interpretation may clear the situation.

After all, what have we gained by following the method of "rawhiding"? The men become dissatisfied, which affects their efficiency, and upon the first opportunity they will leave the service of the company; this necessitates the "breaking in" of a new man, which results in a loss of production, with greater liability to accidents, as well as increase in turnover. Every one desires co-operation in the work, and if the supervisors are considerate but firm, they will be successful in having the men work *with* them instead of working for them.

Safety engineering might be called the study of human nature, which will be one of the important business principles in the future, and is worthy of serious thought.

One quality which plays an important part in safety engineering is the habit of being courteous, by simply saying "please" and "thank you," and bidding the time of the day; just a mixture of good manners and kindliness. It produces sunshine on the cloudy days; its presence cheers a person and puts him in a better mood. We can assist each other by being friendly, and our friendliness will be reflected among our acquaintances, who will become friendly in spite of themselves.

A safety engineer should be an example of good-fellowship, to the extent where he needs an adding machine when he starts to count up his friends. Safety first is applied common sense—it is a service of unselfish usefulness, for there can be no efficiency without common sense.

Book Review

The Coal Trade, by Sydney A. Hale, Editor, *Coal Trade Journal;* cloth; 273 pages, 6 x 8 inches; published by the Estate of F. E. Saward, 20 Vesey street, New York, and furnished by THE IRON TRADE REVIEW for $3.

Statistics down to the latest available date, of the coal trade are given in this forty-sixth annual edition, the publication of which purposely has been delayed beyond the usual press date, in order to present complete data, held up at their source by pressure of war work. The publisher took this course rather than publish incomplete figures.

In addition to the general review of the coal industry in 1918, which occupies 54 pages and deals with production, trade history, values and market conditions throughout the United States, a similar amount of space is devoted to the activities of the United States fuel administration, including price fixing, prices and zoning. Other sections of the volume are devoted to bituminous production by states, bituminous transportation and rate statistics, anthracite production and distribution with transportation statistics, coke and briquets, and export and import statistics. Labor and miscellaneous statistics also are given.

Effect of Heat on Refractories

Fire Cracks Caused by Severe Thermal Changes Shorten the Life of Fire Brick—Degree of Fineness Has Pronounced Effect of the Spalling Loss—Results of Recent Tests

BY C. E. NESBITT AND M. L. BELL

IN MANUFACTURING iron and steel the part played by refractories is most important and up to the present time has not had the proper consideration. Owing to increased production, larger and more complicated furnaces and economy of operation, the necessity for greater efficiency from refractories has arisen. This improvement in refractories can only be accomplished by the cooperation of the consumer and the producer. The consumer should be familiar with the condition prevailing in his furnaces, such as temperature, slag, gases, dust, mechanical wear, abrasion, expansion and contraction, etc., so that he is in a position to know what the brick must stand. On the other hand the manufacturer of refractories should know the limitations and possibilities of his product. He should know the effect on quality in service, produced by variation in moisture, fineness of grind, proportionate sizing of particles, method of molding, drying and burning. Such information enables him to advise the consumer the kind of brick best suited for his particular needs.

In the iron and steel industry the temperature range is wide. Temperatures in the interior of a blast furnace vary from 260 degrees Cent. at the top to 1800 degrees Cent. at the tuyeres. Refining temperatures are high in open-hearth, bessemer converters, and electric furnaces, while temperatures in quenching and annealing furnaces are moderate. Besides this wide range of temperature, refractories must meet a wide variation in physical requirements such as corrosive action of acid, basic or neutral slags, sudden thermal changes, load, abrasion, impact and expansion.

FIG. 1—SMALL PORTION OF DISINTEGRATED REFRACTORY BRICK AFTER FIVE YEARS' SERVICE IN BLAST FURNACE. NOTE SIMILARITY OF CRACKS IN SMALL PORTION AND IN UNUSED BRICK

Early in our investigation we found need for simple tests which would give us some data on the important qualities necessary in refractory brick. These tests should be easily and rapidly executed to be able to be made in quantity and should show a close relation to actual service conditions. This means that the tests employed must be shorter and more severe than actual working conditions and must show variation in working quality.

A series of tests was developed for both clay and silica brick. Data obtained from these tests, after use over an extended period showed that the most important working qualities could be determined by two or three tests, namely the spalling and hot-crushing tests for silica brick, and the spalling, hot-load and slagging tests for clay brick.

By the use of these tests, an attempt is being made to solve some of the refractory problems in the industry, a few of which are the following: Why does the life of a blast-furnace lining vary from two to seven years, basic open-hearth roofs from 25 to 400 heats, soaking pits from six to 18 months, converter bottoms from four to 16 heats and ladle linings from four to 25 heats? How can we explain the fact that one solid brick is found in a blast-furnace lining surrounded by a number of disintegrated bricks and in another place on the same level one disintegrated brick is surrounded by a number of sound bricks? These and many other problems which are difficult to solve

From a paper presented by C. E. Nesbitt and M. L. Bell at the Philadelphia meeting of the American Chemical society, Sept. 4, 1919.

FIG. 2—WEAR IN AN AIR FURNACE PRODUCED LARGELY BY SLAGGING ACTION AND TEMPERATURE CHANGES

FIG. 3—SPALLING OF CLAY BRICK IN THE ROOF OF AN AIR FURNACE SHOWING THE PITTED SURFACE

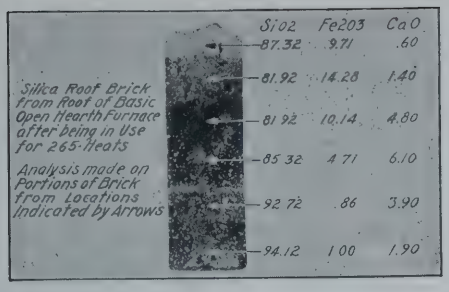


FIG. 4—CHANGE OF COMPOSITION DUE TO ABSORPTION OF IMPURITIES BY SILICA BRICK USED IN ROOF OF BASIC OPEN-HEARTH FURNACE

present themselves. Variations in quality of the refractories are due to method used in grinding, molding, setting, drying, burning and cooling.

Heat Decreases Crushing Strength

Silica bricks when heated from room temperature to 1350 degrees Cent. show a falling off of approximately 50 to 60 per cent in crushing strength, hence defects, which lower the mechanical strength of a product already weakened by heat, are serious factors. Good commercial silica brick crushed at room temperature and at 1350 degrees Cent. together with bricks defective because of fire cracks, poor molding, poor slicking, etc., showed the following strength in pounds per square inch:

Commercial Silica Brick at 30° Cent.	Commercial Silica Brick at 1350° Cent.	Defective brick at 1350° Cent.
1317	989	437
1755	1123	466
2323	1152	466
2685	1282	498
3062	1300	657
Avg. 2271	1169	505

Fire cracks also cause a decided shortening of the life of a silica-brick structure such as an open-hearth roof where there are severe thermal changes. This is well illustrated when commercial silica brick with and without fire cracks are subjected to a spalling test at 540 degrees Cent. The results are expressed in percentage loss in weight of the bricks used.

Free from Fire Cracks	With Fire Cracks
21.9	39.4
22.4	44.0
25.0	44.5
29.1	44.8
33.1	59.4
Avg. 26.3	46.4

Roofs of 90-ton open-hearth furnaces, working under normal conditions with producer gas should last for an average of 200 heats. Bricks taken from a furnace roof after 261 heats showed an average spalling loss of 20 per cent. Another roof which made 221 heats showed a loss of 23 per cent. In a similar roof in which the life was only 80 heats the average spalling loss was 47 per cent.

The degree of fineness or size of particles especially in silica brick has a pronounced effect on the spalling loss. The finer the grind the higher the loss which in turn means a decided shortening of the life of the structure when subjected to severe thermal changes. This is shown from the following test:

Fineness of Grinding	Spalling loss
4 mesh	30.4 per cent
8 mesh	47.6 " "
12 mesh	63.2 " "

The facts stated heretofore in regard to silica brick are generally true with clay brick, except that they are not so marked, owing to the fact that the raw materials have entirely different properties. However, the method of manufacture has a pronounced effect on the qualities of clay brick. This is illustrated by the average spalling value of six different brands of brick, three of which are machine made but by different processes, while three are hand made brick.

Average Percentage Loss by Spalling at 1350° Cent. Machine Made	Hand Made
26.9	7.3
11.7	3.4
9.4	16.7

Again this variation in quality of

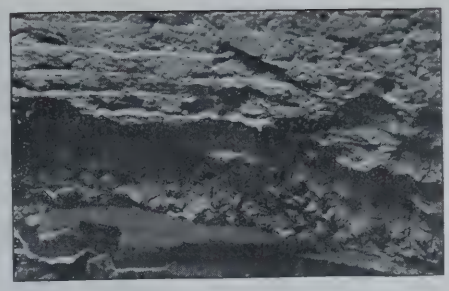

FIG. 7—ROOF OF BASIC OPEN-HEARTH FURNACE SHOWING FAILURE DUE TO UNEQUAL WEAR AS A RESULT OF SLAGGING AND SPALLING

refractories is shown by the results obtained from the load test in which a steel ball is pressed into a fire clay brick heated to 1350 degrees Cent. by applying a load of 1600 pounds. The results are the depth of penetration expressed in inches.

Machine Made	Hand Made
.27	.55
.46	.72
.29	.44

The degree of fineness to which the raw material is ground in clay brick produces results similar to those of silica brick, namely, the finer the grind the greater the spalling loss. The results given here are the averages obtained from two brands of clay brick.

Coarse Grind	8.47 per cent	loss by spalling
Fine Grind	49.95 per cent	loss by spalling

Reduction in strength by heating is shown by the impact test. A steel ball weighing approximately 2½ pounds was dropped by a suitably designed machine from successive increasing heights of 2 inches upon the heated brick. The brick tested was a well-known ladle brick made largely of plastic clay.

Temperature, degrees Cent.	Average inches
30	51.2
340	40.3
480	33.6

The effect of extreme variation in degree of burn is well illustrated in a recent shipment of clay checker brick. The average spalling loss was

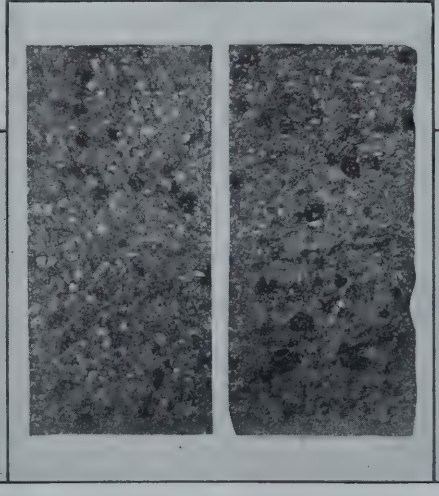

FIG. 5—CLAY BRICK FROM COLD-BLAST MAIN OF A BLAST FURNACE SHOWING EROSION PRODUCED BY THE DUST CARRIED IN THE BLAST. FIG. 6—BLOCKS CUT FROM TWO SIMILAR SILICA SHAPES SHOWING VARIATION IN FINENESS OF GRIND. FIG. 8—SILICA BRICKS DEFECTIVE FROM FIRE CRACKS, POOR SLICKING AND FOREIGN MATERIAL

14 per cent for the average burn and 60 per cent for the hard-burned bricks.

From all comparative data it is evident that refractories require more than general consideration. They demand a most thorough study by both the producer and consumer. Investigators should adopt simple practical tests which can be run in quantity and which give data showing variations in quality.

The consumer judges his refractories by the life obtained and demands a product giving a more uniform life. Variations in uniformity are largely due to methods of manufacture. It is believed that a much more uniform product can be secured if a careful study is made of the variation in manufacture which affects the important qualities.

To afford the university student a special opportunity for theoretical and practical training in electrical apparatus, the Georgia School of Technology is installing a full equipment of electrical machinery manufactured by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. This equipment, which practically composes a complete power plant, consists of a 187-kilovolt-ampere generator and a 125-kilovolt-ampere generator driven by steam turbines through reduction gears; a surface condenser; a 175-kilovolt-ampere coupled type generator for gas or steam engine drive; a 25-kilowatt, direct-current geared turbine exciter unit; a 3-phase induction motor driven by a 50-kilowatt, direct-current generator; one 15-horsepower, two 50-horsepower and one 100-horsepower squirrel cage induction motors; three 50-kilovolt-ampere, 220-2200-volt transformers; one 2-kilovolt-ampere 50,000-volt testing outfit and one complete switchboard including an automatic voltage regulator and necessary control for all of the above generators and exciters together with a number of alternating and direct-current feeders.

How to Prevent Blast Furnace Slips

OBSTRUCTIONS in the working of blast furnaces frequently occur and are often a source of considerable trouble. They constitute impediments in the furnace arising from various causes, such as faulty distribution of the charge and preventing the proper and regular descent of the stock. While the charge below the scaffold is working down, the material above is left without support from beneath and the weight of the ore, coke and limestone is at the same time being increased constantly by the addition of materials at the top of the furnace. Under these circumstances the obstruction at a certain point frequently gives way and descends with considerable force constituting what is known as a slip and ejecting ore, coke and limestone through the bleeder or explosion door sometimes as high as 100 to 150 feet into the air. The view at the left of accompanying illustration shows the beginning of a blast-furnace slip while that at the right shows the furnace a few minutes later.

Among the causes contributing to the formation of slips are the production of an imperfectly fusible slag; faulty shape of the furnace; bad fuel, such as weak coke which crumbles away under the weight of the other materials in the charge; charging too large a proportion of refractory ore, and faulty charging which does not maintain a regular heat distribution, owing to the larger pieces of coke collecting around the walls of the furnace, while the small and impermeable ore is concentrated in the center. A slip, besides preventing the regular descent of the charge, also obstructs the free passage of the blast, the escape of the furnace gases and injects cold stock into the hearth.

Aside from altering the design and construction of a furnace perhaps the most common method of preventing slips, especially when the furnace is working on high pressure and when prompt action is required, is to reduce the pressure of the blast to about 8 pounds per square inch until the stock is dislodged. By this means, the condition is righted for the time being, although it usually is necessary to continue the checking of the blast at intervals of 45 minutes. In the meantime other procedures are found useful. These include changing the burden and the method of charging; altering the length of the tuyeres; charging extra coke; or, manipulating the volume, pressure and temperature of the blast.

UNUSUAL VIEWS OF BLAST FURNACE AT TWO DIFFERENT STAGES OF A SLIP

View at left shows a blast furnace slip at its greatest intensity and at the right, the appearance of the furnace at the end of the same slip. The cloud of gases shown at the left contains considerable ore, coke and limestone which is shot into the air sometimes as high as 100 feet above the top of the furnace. During the forepart of a slip the gases in the upper part of the furnace sometimes are under a pressure of from 10 to 20 pounds per square inch

Automobile Builders Protected

A Special Organization Disposes of Motor Vehicles Released From Military Uses — German Industry is Restricted on Account of Substitute Materials — Iron Ore is of Poor Quality

AS GREAT interest has been shown in the matter of how the United States government intends to dispose of surplus war supplies, it is pertinent to note how Germany is dealing with automobiles and trucks used by her armies. Twenty German automobile manufacturers organized a special company in 1915 to take over the motor vehicles released by the German army and to dispose of them with as little disturbance as possible to the automobile industry. The Germans foresaw a flooding of the automobile market after the war and undoubtedly this would have occurred had there not been an enormous shortage of repair parts.

The automobile industry of Germany, it is reported, is gaining rapidly in production despite numerous strikes and riots. The demand for motor cars, especially of the lighter type, is far above production. Sales have been restricted by the government until essential business requirements have been fulfilled.

The expected drop in prices has failed to materialize, especially in the case of commercial vehicles. A three-ton truck, which sold in Germany for about $3927 before the war may now be obtained for $7200, equipped with tires of iron and wood. Such a truck used during the war and now overhauled may be bought for $2880. While orders are now being accepted by the manufacturers, the scarcity of raw materials and uncertain conditions make it necessary for them to stipulate a delivery period of several years and to protect themselves thoroughly in regard to prices.

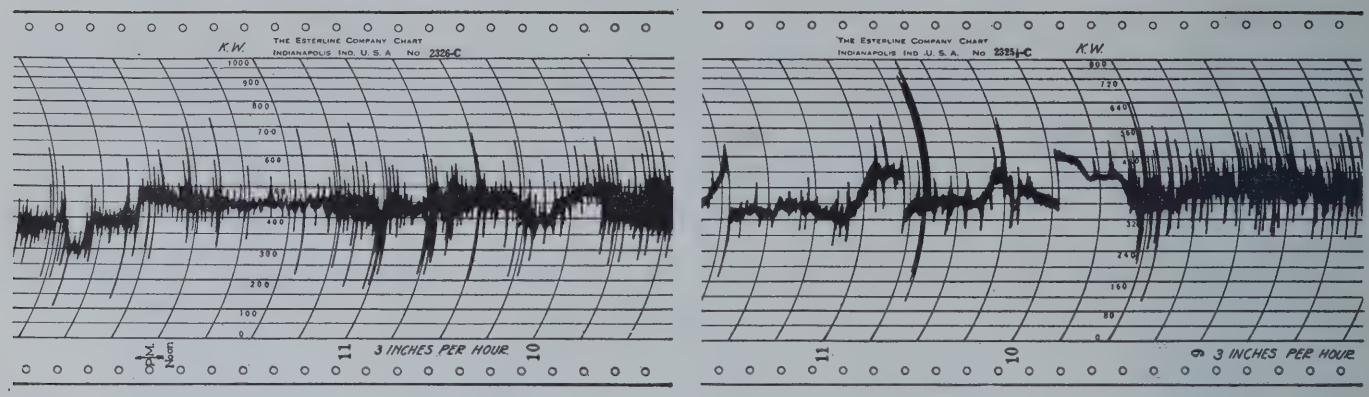
Substitutes Were Sought

The wide extension and prolongation of the world war brought unexpected and destructive disturbance into the industrial world of Germany by cutting off, for more than the provided for few months, the supply of raw materials, particularly of imported raw materials, according to *Zeitschrift für angewandte Chemie*. It became necessary, therefore, to economize in the use of those materials, to develop the home sources of supply, and to seek for substitutes. As consequences of these compelling conditions, the industries of all the belligerent countries, but especially those of Germany, have developed in direction and degree that makes it necessary to take full account of the changed circumstances in any scheme of reconstruction. Moreover, it is obvious that much of what has been done in one country can be done in others. The outstanding features of the changes, actual and contemplated, which will have their reflex in the engineering and manufacturing world may be classified under the four heads of power, transport, raw materials, and substitutes.

Must Use Water Power

The question of power concentrates itself around the two points of water fall utilization and the wider application of electric energy. These two points are closely related, inasmuch as the utilization of water power is largely dependent on electric transmission. This is a matter to which German engineers, as well as statesmen, are turning expectant attention. Closely related to this question of the production and distribution of power is that of transport by road, river and canal. Here great developments are possible, and are urgently called for, to meet the altered circumstances of the times. The supply of raw materials is a question of the first rank, and for the moment is, for Germany, the most pressing. Germany's wealth in coal is an assured quantity in the future development of her industries. But the cry has gone out for more economical consumption. To this end special scientific institutions have been and are being founded. The conservation of the coal reserves connects itself with the further utilization of water power. But the fuel question cannot be thought of without that of quick and cheap transport arising in the mind. Germany is rich in iron ores as well as in coal, though their quality is inferior to that of France's in the Briey basin. Improved and more economical methods of working will go far to counterbalance a relative poorness of ore. Meanwhile the country is being carefully searched for yet undiscovered deposits. Though Germany may be for long cut off from supplies from the West, it may look for larger imports from the East. The country's wealth in zinc is a factor to reckon with, while her ability to produce aluminum is unlimited.

Another raw material of growing importance is mineral oil. With a view to obtain a larger home supply of oil, borings are being made in likely places all over Germany. Some of them are already yielding a promising supply. Of imported oil, nearer sources than the United States are likely to be found. The question of substitute materials must not be lost sight of; their number is surprisingly great, and some of them, doubtless, have come to stay.



Production of pig iron in German blast furnaces during the year 1913 amounted to 16,770,000 tons. In this production 37,830,000 tons of iron ore and 700,000 tons of manganese ore were used. Of the iron ore and ferromanganese ore smelted, 25,900,000 tons were produced in Germany, and 11,900,000 tons imported from foreign countries. The tonnage imported from the various countries follows: Sweden, 4,201,715; Spain, 3,726,254; Belgium, 68,841; France, 2,237,979; Greece, 141,269; Austria-Hungary, 107,053; Russia, 423,957; Africa, 792,555; America, 173,588; other countries, 50,799. Of the manganese ore smelted, only 2059 tons were produced in Germany or imported from Austria-Hungary and Sweden, while the tonnage imported from other countries was: Greece, 3227; Russia, 433,632; Spain and Brazil, 85,163; India, 176,751.

Nearly all German iron ores are poor, with less than 40 per cent iron content, while 75 per cent of the iron ore produced in German mines is so rich in phosphorus as to be suitable only for the Thomas smelting process. Of the imported ores it may be estimated that 55 per cent are Thomas ores and 45 per cent bessemer ores.

Iron Ore is Limited

The total reserve of iron ore in Germany amounts to only about 2,300,000,000 tons, and the most important German iron ore district, the German-Lotharingian minette district, will be exhausted within 45 years, while the Siegerland and Nassau districts, which are the next in order of importance, will be exhausted in 42 and 66 years respectively. Only a few districts of little importance for the ore supply of the country have reserves sufficient to last for more than 100 years. Thus great importance attaches to foreign sources of supply.

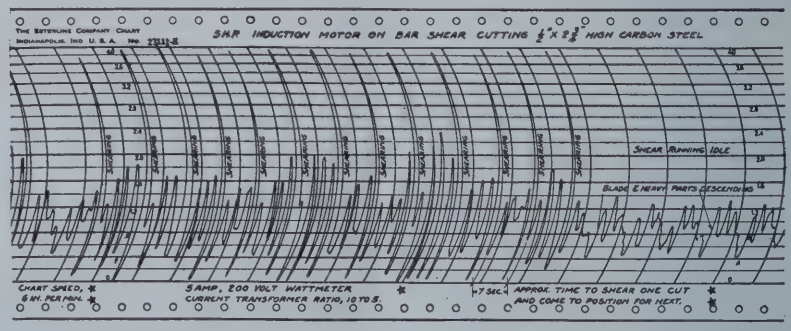
Germany is almost entirely dependent on foreign countries for her supply of manganese ores. The most important manganese ore deposits are at Tochiatura, in the Caucasus, of which the total reserve is estimated at 110,000,000 tons, and Nikopol, in Ukrainia, of which the reserve is estimated at 7,400,000 tons.

Graphic records showing power consumed in a 2-ton electric furnace. The curve at the left was obtained during a run on 3000 pounds of high nickel steel and that on the right during a run on high speed steel.

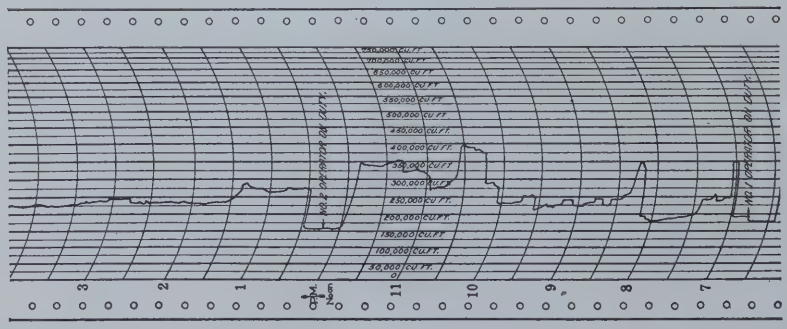
Curves Reveal Significant Facts

Valuable Data Which Indicate Performance of Personnel, Machine Equipment, and Administration Policies in Manufacturing Plants Are Obtained From Graphic Records

AFTER years of experience it has been established that in many operations the power input to machine tools is a measure of the efficiency of the tools and that the power consumption is a factor which should be considered when machines are installed and grouped in a shop. Power input also is recognized as a reliable criterion of the output of metal working plants, as under certain conditions a definite relationship exists between the kilowatt consumption and the quantity of product. Graphic records have aided materially in studying the bearing of power consumption on efficiency and production, and have revealed significant facts which have enabled engineers to correct the defects exposed.



Upon studying the power consumed by large drawing and stamping presses it has been determined that improperly matched or dies with other imperfections can be detected by the power curve. Records are taken whenever new dies are put in use and if the consumption at any step in



Aid to Efficiency

THE curves shown and explained in the accompanying article are of particular interest to engineers and plant executives in the iron and steel industry as they illustrate in a striking manner how records have helped to solve production problems. The curves were selected from a large number appearing in a circular entitled "Typical Graphic Records," just published by the Esterline Co., Indianapolis.

Motor Was Too Large

THE curve at the right showing the power consumption of a bar shear revealed the fact that the 5-horsepower three-phase induction motor driving it was subjected to an average load of less than 1½ kilowatts. A 2½-horsepower motor was substituted and has given satisfactory service, showing that the shear was over-motored by 100 per cent.

Checks Operators' Work

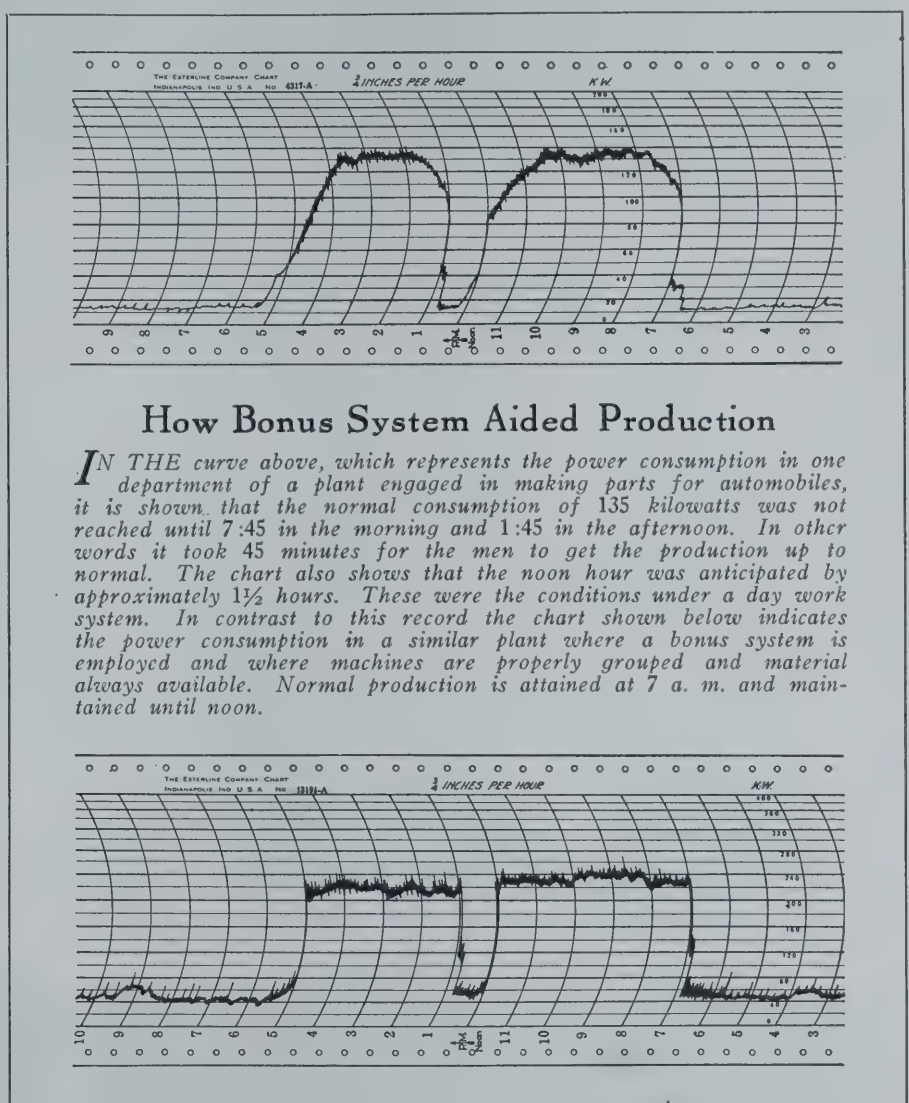
FREQUENTLY it is desirable to check the work of gas plant operators. The curve at the left shows that the operator who was on duty from 7 a. m. until noon failed to control the gas output within reasonable limits. No 2 operator who took charge at 1 p. m. maintained the output at or near 250,000 cubic feet during the afternoon.

a certain operation is excessive, the dies are examined and the defect corrected.

Frequently a graphic record of the power input can be used to advantage in determining the size of motor required to drive a machine. A case of this kind is illustrated by the curve shown on page 1116 which indicates the power consumed by a bar shear cutting ½ x 2¾-inch high carbon steel. This shear was driven by a 5-horsepower three-phase induction motor. According to the curve the maximum loads were slightly under four kilowatts and the average load on the motor did not exceed 1½ kilowatts. The 5-horsepower motor was replaced by a 2½-horsepower motor which has been giving satisfactory service, showing that the bar shear was over-motored by 100 per cent.

Measures Efficiency

The two charts shown on this page illustrate how the power input to a machine shop may be used as a measure of the efficiency of operation, and to some extent, of the output. The upper curve was taken on a power circuit feeding one department of a plant making automobile parts. It previously had been determined that the power input varied roughly with the output of finished parts. The chart shows that under the day rate system and partly because the machines were not properly grouped the men did not get the production up to normal until 45 minutes after the starting time and that the noon hour was anticipated by about 1½ hours. It took approximately 45 minutes to get the production up to normal after the noon hour and the falling off prior to 5 o'clock was much greater than that preceding the noon hour. These conditions were greatly improved by installing a bonus system, rearranging the machinery and making provisions for supplying the workmen with raw material more promptly than before. The lower chart shows the power consumption of a machine shop manufacturing automobile parts on the bonus system under highly efficient management. It will be noticed that the normal production is attained promptly at 7 and 1 o'clock, and that it is uniformly maintained until quitting time.



The curves at the top of page 1116 comprise the pictorial history of two heats in a 2-ton arc-type electric furnace. The curve at the left shows the power consumed during a run on 3000 pounds of high nickel steel. The charge was fed into the furnace without preheating. The power taken at the beginning of the heat was small, but as the resistance of the furnace circuit decreased owing to the heating up of the electrodes and the consolidation of the charge, the power rapidly increased until stable conditions were reached. The excessive variations were due to pieces of metal falling between the electrodes and short circuiting them as the charge melted down. The short circuits were only temporary as the fragments causing them were promptly melted. At the end of the run the temperature was lowered for a special treatment of the metal before pouring. The curve at the right shows the consumption during a run on high speed steel. This chart shows more irregularities as a result of short circuiting than the other record. A higher temperature was required toward the end of the run to secure certain physical characteristics.

The curve at the bottom of page 1116 showing the efficiency of two gas producer operators was obtained by a recorder attached to a gas meter. The afternoon operator maintained a uniform output while the production in the morning was irregular.

Has Record Coal Output

A total of 18,213,000 tons of coal, the greatest amount that has ever been recorded, was the consumption of industries in India in 1917, according to statistics made by the British government last year. The main demand came from the railroads which used 31 per cent of the amount, or 5,620,000 tons, and their requirements seem to govern the production. Fuel for the royal marine amounted to 1,429,000 tons or 7.8 per cent. Supply to shipping to other than the marine amounted to 1,514,000 tons or 8.3 per cent of the total output.

These three items accounted for 8,563,000 tons or practically half of the entire output. The greater part of the remainder was used by home industry, jute mills, cotton mills, iron and brass foundries, engineering workshops, brick and tile factories and pottery and cement works. Wastage and consumption at the collieries and domestic consumption by establishments which did not make returns accounted for the balance.

How Bonus System Aided Production

IN THE curve above, which represents the power consumption in one department of a plant engaged in making parts for automobiles, it is shown that the normal consumption of 135 kilowatts was not reached until 7:45 in the morning and 1:45 in the afternoon. In other words it took 45 minutes for the men to get the production up to normal. The chart also shows that the noon hour was anticipated by approximately 1½ hours. These were the conditions under a day work system. In contrast to this record the chart shown below indicates the power consumption in a similar plant where a bonus system is employed and where machines are properly grouped and material always available. Normal production is attained at 7 a. m. and maintained until noon.

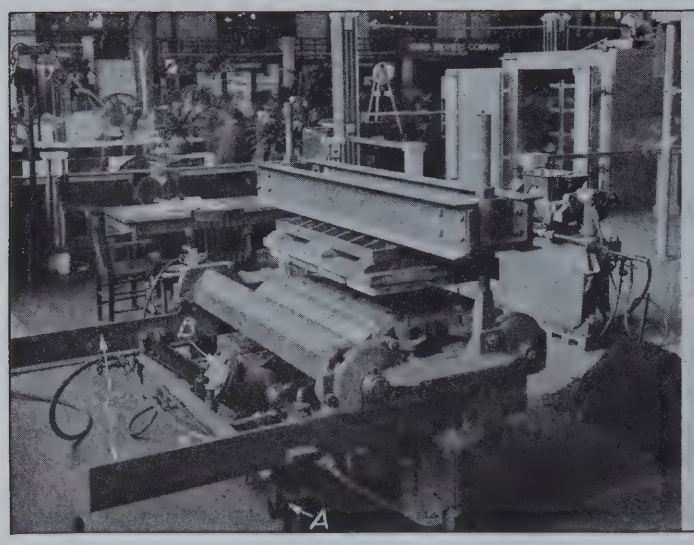


Fig. 1—Squeezer Head Moved Forward to Permit a Clear View of the Back Construction

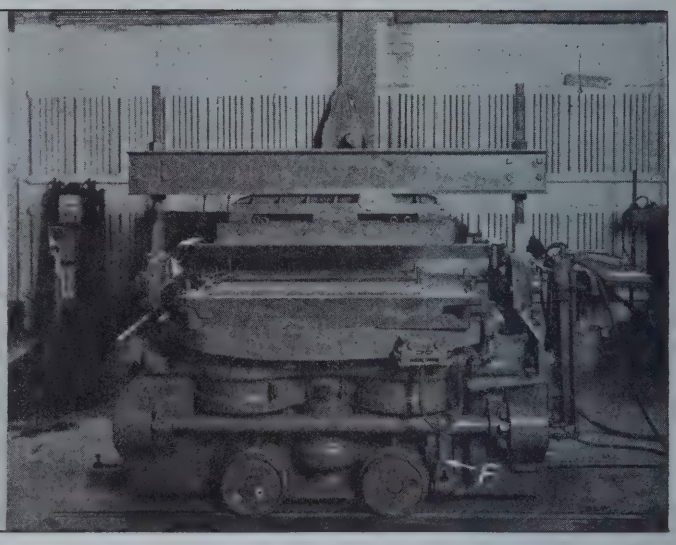

Fig. 2—Front of Machine Showing Lever which Actuates the Stripping Mechanism

Makes Cope and Drag Simultaneously

AN INTERESTING new combination jar-ram, squeezer and stripping-plate molding machine has been developed by the Cleveland-Osborn Mfg. Co., Cleveland, for making both cope and drag molds at one operation. It is an adaptation of a machine originally built for making rear axle housings at the plant of the Saginaw Malleable Castings Co., Saginaw, Mich.

The machine is self-propelled and has been designed to travel on a narrow-gage track parallel to the sand heap and to lay down a long single row of molds. The track may also be laid across a number of sand heaps and a number of molds laid down on each floor before the machine moves on to the next. It is provided with an air motor, *A*, Fig. 1, at the back of the main frame which enables it to travel under its own power.

The main frame and cylinders of the machine are cast integrally and the whole is mounted on four wheels running in ball bearings. Means of lubricating each wheel is provided so that the machine may be moved at all times with a minimum of power.

A pair of machined 6 x 1-inch steel bars, to which attention is directed by *C*, Fig. 1, are attached to the frame, one at each end. The overhanging ends are supported and held parallel and in line by a pair of cast-iron brackets shown in the same illustration.

As may be seen by consulting Figs. 1 and 4, the frame which carries the squeezer head moves back and forth on this pair of slides. This frame is of rigid construction and is mounted on four wheels which in turn are provided with roller bearings. Therefore but little effort on the part of the operator is required to move the head back and forth. The construction of the head and the means adopted for regulating the position of the pattern-plate to accommodate any depth of flask are clearly shown in Fig. 3. The steel I-beams carrying the head are held together at each end by cast-iron distance pieces which in turn function on substantial threaded rods or guides. By means of lock nuts, the distance pieces can be held in any position between the top and bottom of the rods. The I-beams support on their lower side a light rectangular plate which is rendered stiff and strong by external flange and a series of longitudinal and transverse ribs.

This plate is not brought into contact

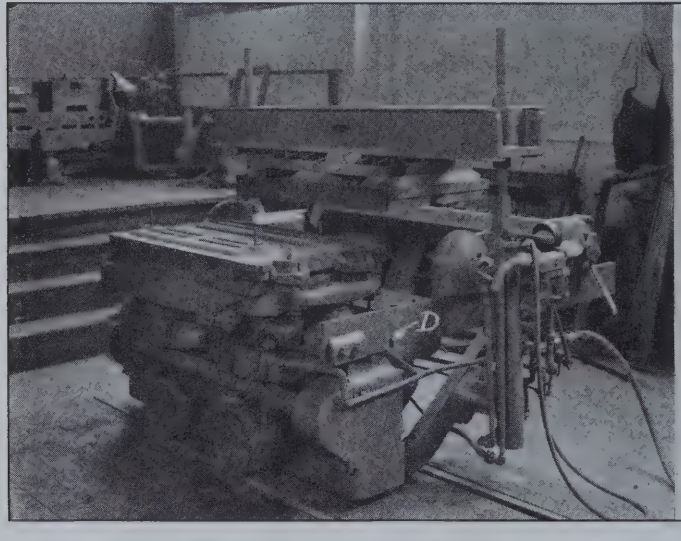

FIG. 3—THE MACHINE WILL NOT FUNCTION UNTIL A CATCH ON THE HEAD ENGAGES THE SLOT *D*

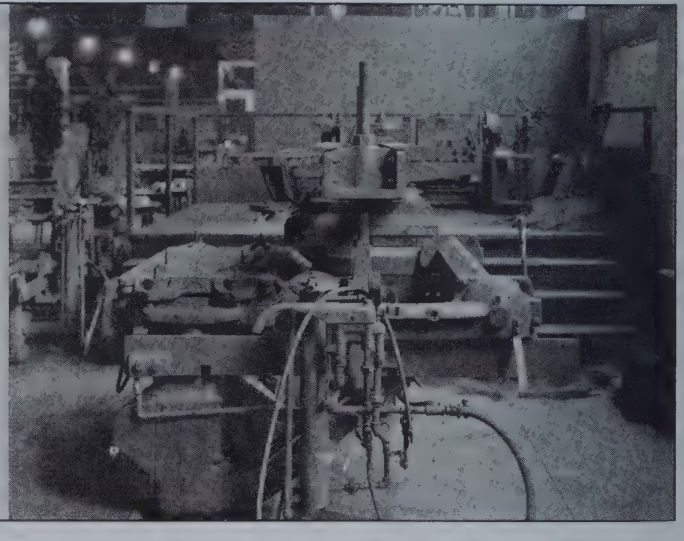

FIG. 4—CONTROL OF ALL MOTIONS EXCEPT TRAVELING IS CENTERED IN THE COLUMN *E*

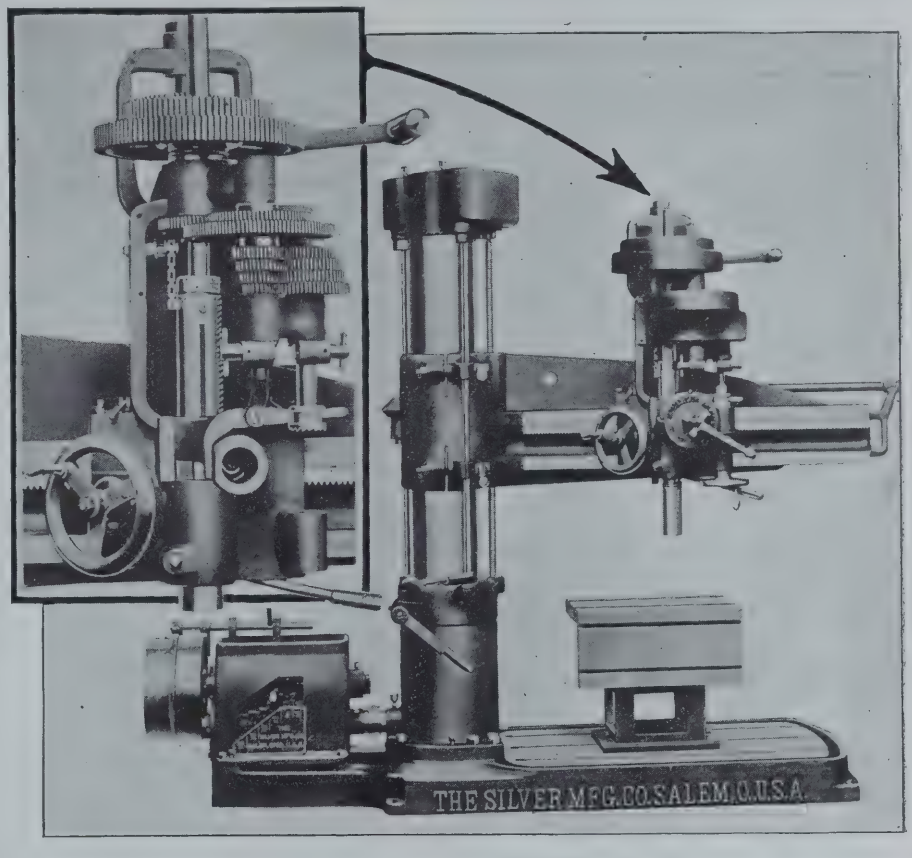
with the sand in the flask. A strong, thick wooden board is used for that purpose. The upper side of the board is provided with three battens which are attached to the iron plate just referred to. A number of pads which come into intimate contact with the sand are attached to the lower side of the board.

Instead of letting the board go perfectly flat these pads are provided on account of the transverse bars in the flasks. The spaces between the pads correspond to the positions of the bars.

The air supply is centralized in the column *E*, Fig. 4. All the movements of the machine with the exception of traveling along the track are directed by the operator while standing near this column.

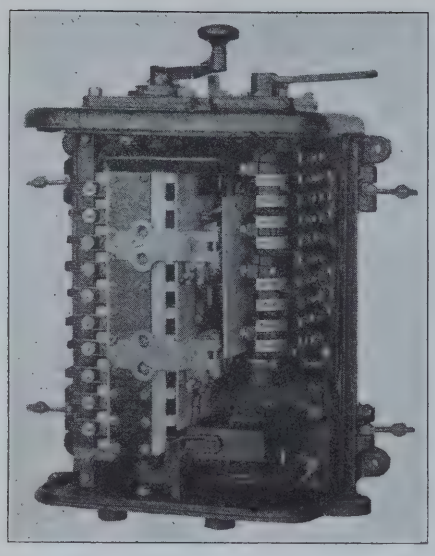


The cylinder for actuating the pattern stripping mechanism is shown at *B* Fig. 1, and at Fig. 2 may be seen the lever and shaft through which the force is transmitted.

Long stemmed chaplets bearing square heads are used as in ordinary radiator molding practice. There are holes through the patterns at the points where the chaplets are to be placed. Immediately below each hole a pin, which is made a loose sliding fit, is attached to a projection on the under surface of the stripping plate. The lower ends of these pins are threaded and by the aid of a pair of lock nuts they may be adjusted to any height within their limitations. Their relative height determines the thickness of metal in the proposed casting. Again, when the mold has been rammed, the stripping-plate lifts the flasks off the patterns and at the same time causes these pins to follow the chaplets up through the holes. Thus is discounted any possibility of the chaplets sticking in the pattern and therefore being loose in the mold.

When in use, the squeezer head is pushed back to the position shown in Figs. 2, 3 and 4. The cope and drag are placed on the pattern plate and a wooden frame 4 inches in height is placed on top to hold a surplus of sand. When the flasks have been filled with sand the valve controlling the jarring mechanism is opened and the mold rammed to a predetermined density. The wooden frame is then removed and the squeezer head brought forward. A thin iron straight edge, *H*, Fig. 2, precedes the squeezer board and provides a perfectly even surface for the pads to press against. The squeezer head automatically adjusts itself to the position of the flask by means of a catch which engages the slot *D* Fig. 3. The table is then raised and the sand squeezed. It is next lowered back to its original position, the vibrator set in motion and the flasks stripped from the patterns. Two men lift the flasks off the machine and set them on the floor.

New Radial Drill Has Safety Features



A radial drill having a number of novel features has just been developed by the Silver Mfg. Co., Salem, O. The base of the machine, which is built in 2½, 3 and 3½-foot sizes, is ribbed both lengthwise and crosswise, and has an oil channel which drains into a reservoir under the column. The column is of semi-steel and of new design. The inner column or post has a wide bearing on the base and extends to the top without taper. This casting has interior ribs which just clear the drive shaft. The outer column telescopes the post and rests on ball bearings which facilitates the swinging of the arm and also takes the thrust load. The radial arm is raised and lowered by power at a ratio of 2 to 1. The arm is clamped to the column by two levers, the bolts of which serve an unusual purpose. As shown in the accompanying illustration when the lever is placed in the clamping position it tightens the split hub through which the controller shaft runs, thus preventing the elevating screw from being set in motion while the arm is clamped to the column, avoiding any possibility of wrecking the machine. The arm also is provided with a safety nut which runs idle on the elevating screw. In case the threads of the elevating nut become worn sufficiently to allow the arm to drop, the weight of the arm is automatically transferred to the safety nut. The head has a wide bearing on the arm and carries the back gears which provide two speeds. The drive gear on the spindle revolves on ball bearings and is equipped with two keys for driving. The spindle is of high carbon crucible steel and the sleeve is bushed with phosphor bronze bearings. There are eight changes of feed ranging in geometrical progression from 0.005 to 0.040 inch per revolution of spindle. Any of these feeds may be obtained while drilling by two feed handles. The hand feed through the worm may be fed ahead of the power feed, saving time when starting to drill. It is controlled by a single lever which also acts as a quick return. The machine is equipped with a depth gage and automatic feed trip for drilling to a predetermined depth. The drill also is equipped with a tapping attachment.

NEW RADIAL DRILL—INSET SHOWS DETAIL OF HEAD

Six changes of speed can be obtained through the speed box which is bolted onto the base and provided with an oil pan permitting the gear to run in an oil bath. The speed box with the back gear on the head, provides 12 speed changes in all.

The University of Pittsburgh, school of economics, now is offering a com-

CONTROLLER FOR SERIES—PARALLEL OPERATION OF LOCOMOTIVE MOTORS

plete four-year course in industrial management in co-operation with the school of engineering. Work in the school of economics will be centered in the field of industrial organization and scientific management, cost accounting and employment management, and will be supplemented by scientific and laboratory study along engineering lines to furnish a background for the student who intends to specialize in the business side of industry.

Develops Drum Controller

A drum type controller for series-parallel control of two series motors has just been developed by the Cutler-Hammer Mfg. Co., Milwaukee. This controller, which is provided with both a main cylinder and a reverse cylinder, is for use on storage battery locomotives or on trolley locomotives using 250 volts or less.

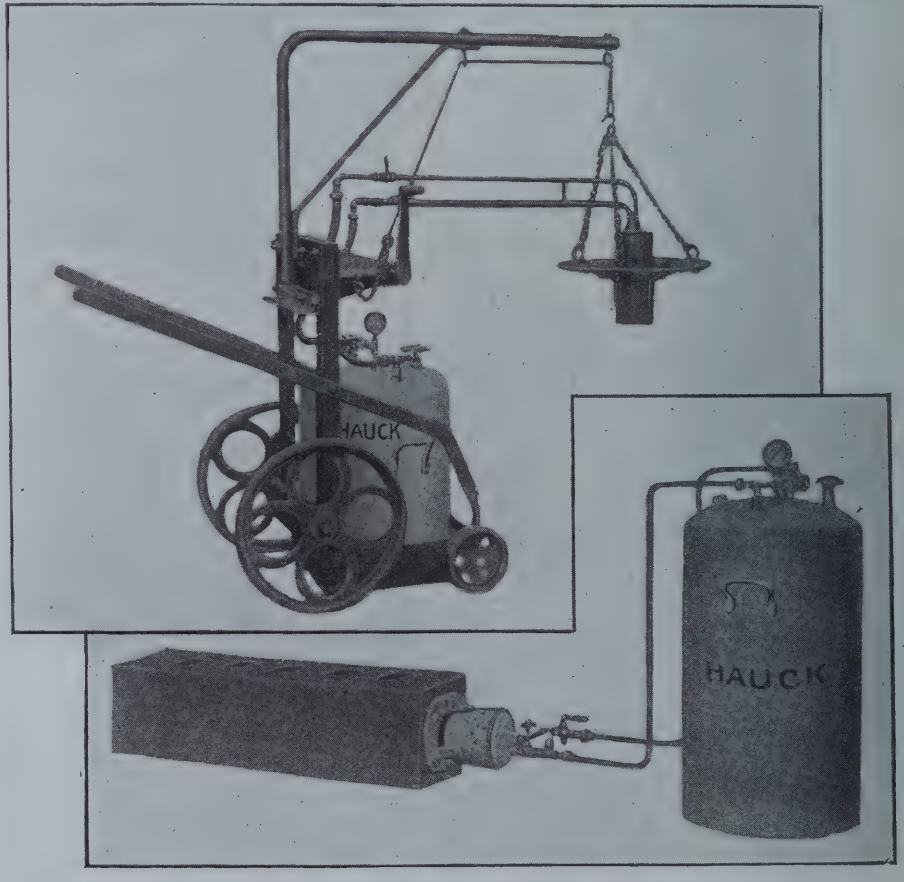
The motors are accelerated by the main cylinder, which has seven points of control. A star wheel provides an interrupted motion to the lever, so the operator readily feels the speed points. The fourth point is the full series or low speed running point and the seventh the full parallel or high speed running point. All intermediate points are resistance points.

The reverse cylinder is positively interlocked with the main cylinder so it cannot be operated when the latter is in any but the "off" position. Two cutout switches allow either motor to be by-passed, if it becomes damaged.

A year ago of the 211 registered factories of the metal industry in the Moscow district, 79 or 38 per cent were closed, while the output of the rest was greatly reduced, only about 40 per cent of the workmen remaining. In last October, 161 of the textile factories were closed, and 14 cement works were idle. The number of workmen in the rubber industry has fallen from 32,000 to 7500. The greater number of these factories are closed, while the remainder have sufficient benzol for approximately two months. Moreover the naphtha industry, an important one in Russia, is in a languishing condition for want of fuel. The distillation works have been compelled, for lack of raw material, to dismiss workmen. A similarly lifeless state marks the sugar, paper and match-box industries.—*Zeitschrift für angewandte Chemie.*

New Heaters for Large and Small Ladles

New equipment for drying crane, bull and hand ladles, developed by the Hauck Mfg. Co., Brooklyn, N. Y., is shown in the accompanying illustration. The portable outfit, shown at the left, is designed for heating large ladles. It is claimed that this heater will thoroughly heat and dry the lining of a 50-ton ladle in 15 minutes, depending upon the heat required.



The apparatus consists of a 20-gallon steel oil tank, equipped with a 150-pound pressure gage, oil and air regulating valves, one length of special oil resisting hose and one length of high pressure air hose, one burner with long handle and deflecting plate. The tank is mounted on an angle iron truck. Attached to the truck is a swinging davit, from which is suspended by steel cable the burner with the deflecting plate. The deflecting plate may be lowered or raised as desired, as the steel cable is connected to a small winding crank on the truck.

The burner operates with compressed air from 20 to 100 pounds pressure and uses crude or kerosene oil. The flame of the burner, directed down towards the bottom of the ladle, spreads evenly, heating the sides and bottom of the ladle.

The device shown at the right of the accompanying illustration is designed to heat a number of small ladles at a time. The apparatus consists of a sheet iron box reinforced with angle iron and lined with firebrick, a furnace burner and a 20-gallon steel oil tank.

The ladles are placed bottom up over the opening of the box and the flame of the oil burner shoots up through the openings, drying the linings of the ladles. The fire box can be made any desired length to heat any number of ladles.

The burner consumes crude or kerosene oil in connection with compressed air at from 20 to 100 pounds pressure. The connections between the burner and the tank can be made with pipe.

PORTABLE APPARATUS FOR DRYING CRANE AND BULL LADLES—DEVICE FOR HEATING SMALL LADLES

Gear Standardization a Reality

Eighty Per Cent of the Industry Votes for Specific Plan, According to Report Submitted at Manufacturers' Convention in Boston — Labor and Technical Problems Receive Attention at Meeting

WITH the standardization of gear manufacturing well begun, and with labor questions thoroughly discussed, the American Gear Manufacturer's association closed its semiannual convention in Boston, Thursday night, Oct. 16. In many ways the convention proved one of exceptional accomplishment. One hundred and fifty members attended.

Standardization of gears has been considered by the association for some time, and is regarded as the most important work now under way. The committee on standardization met every day and several reports were presented at the regular sessions. B. F. Waterman, of Brown & Sharpe Mfg. Co., Providence, R. I., is the chairman of the committee.

A vote on the adoption of the committee's tentative plan for standardization was taken among gear companies, and the plan was endorsed by approximately 80 per cent of the industry in the country. There are many details still to be worked out, such as relate to back lash, tolerances and design, but with such a large percentage of the industry supporting the movement it is said gear standardization will soon be a reality.

On Monday, A. A. Alles Jr., of the Fawcus Machine Co., Pittsburgh, presented a paper on uniform cost accounting in which he explained the importance of keeping accurate costs. The federal trade commission some years ago investigated 250,000 business concerns, and of this number found but 5 per cent that knew their manufacturing costs. Mr. Alles said uniform accounting systems usually produce excellent results. He called attention to the fact that the American Foundrymen's association has been working along the lines of uniformity of costs and at its recent convention in Philadelphia, the cost committee recommended that details of its standard cost system be published in the proceedings.

To be successful, a cost accounting system must be so interwoven with the company's general account that either one would be incomplete without the other. "Unquestionably a great deal may be accomplished," said Mr. Alles, "if an organization such as ours enters heartily into an attempt at adopting uniform cost keeping methods."

Gives History of Worm Gears

On Tuesday, the principal paper presented was entitled "Worm Gears," by A. Fleckenstein, of the Hindley Gear Co. This paper covered the history of worm gears, which were in existence in the fifteenth century, and described many typical modern installations.

It is estimated that the load due to the fire of a heavy gun on a battleship is 350,000 pounds, and this is carried on the pitch line of a gear only 25 inches in diameter. One method of manufacturing the gears is to cut them from solid blanks, and accuracy is obtained by having the cutters which produce the worm and the wheel rotate on their own axes under positive drive. Afterward the gears are ground together to provide good contact and smooth motion.

Roger W. Babson, statistical expert, Wellsley Hills, Mass., talked to the members of the association at their luncheon, Tuesday, on the labor problem.

"The open shop," he said, "is fundamentally essential to industrial success. Next to this comes a recognition on the part of employers of the fact that wage earners are men. The labor question is progressive, and not a problem to be settled now for all time. The labor conference in Washington will be to the labor situation, what a safety valve is to a boiler. It will ward off an explosion by giving each side a better understanding of its feelings.

"Judge Gary is the first man to stand up publicly and tell the truth without trying to soften his terms for the pleasure of his opponents."

The solution of the labor problem, he said, is not one of wages and hours, but one of psychology. "Appeal to men's hearts and you have solved the problem," he declared.

In discussing the labor problem at the Wednesday session, J. D. Foote, of the Foote Bros. Gear & Machine Co., Chicago, said: "There is nothing mental or emotional about it. We cannot stop labor from organizing, and the only thing for the manufacturers to do is to organize themselves as strongly as possible. The demands of the labor unions are autocratic; there is no give and take to it; they will not reason. As to wages, I think we should not quibble over 5 cents an hour."

S. L. Nicholson, of the Westinghouse Electric & Mfg. Co., read a paper on system and organization in commercial activity. "You should know the possibilities of the territory around you," he said. "The salesman should know the talking points. Slipping belts decrease speed, gear drives give constant and reliable speed. Filling the demand is not developing business. Price is not a good reason for losing business. If you are in business you believe you can give as much for a dollar as your competitor. The salesman should know the plant and its operations, and if certain tools are going to be idle he should look up customers who want the things that are made by those particular tools."

Thursday, A. F. Cooke, of the Fawcus Machine Co., talked about herring-bone gears and told of some of the difficulties in manufacturing them for large, high-speed work. He told of installations recently made for the United States shipping board, in which gear trains transmitting 1400 horsepower were used to reduce revolutions per minute from 3200 to 90. In a test at the shop the gears were operated at 4200 revolutions per minute and during the test it was possible to hear ordinary conversation near the gears.

"After much investigation of the practice both in Europe and here, we adopted a spiral angle of 22½ degrees for all of our gears," said Mr. Cooke. "The high-speed gears are made of forged steel in order to cut down any tendency toward distortion in the heat treatment." The convention was welcomed to Boston by Arthur Hill, city counsel, representing Mayor Peters, and later in the week Mayor Peters himself formerly presented the keys of the city. The members visited many of the industries and points of interest in the Boston district, and witnessed the launching of the United States destroyer REID at the Squantum navy yards. The next convention will be held in Detroit, in April, 1920.

Mine Operations Fairly Active

Agitators Fail to Make Any Progress Among Workers on Iron Ranges—More Men Employed by Minnesota Steel Co., Than Before Sept. 22—Many Aliens Are Leaving—Anti-Tonnage Tax Organizations Formed

Staff Correspondence of The Iron Trade Review

DULUTH, Oct. 20.—Beyond a moderate slowing down in ore shipments from the docks at the outset, Duluth and the Minnesota iron range districts have not been affected by the steel strike. Not an employe quit at the plant of the Minnesota Steel Co., here, and the company's blast and open-hearth furnaces are operating at practically the same rate as they have been since early last summer. More men are now being employed by the company than when the steel strike was declared, as the result of an increased demand in this district for its semifinished steel, following the cutting off of supplies from plants in the Chicago district. Approximately 1700 men are employed in the various departments and there is no labor trouble.

There was no strike trouble of any kind on the Mesabi range, but in the Ely district of the Vermillion range, two mines of the Oliver Mining Co. and two independent mines, the Chandler and Zenith, were closed. The Oliver mines have been closed for the balance of the season, and it is not expected that the independent properties will be operated again this fall.

Operations have been on a fairly active basis at all the working mines on the ranges during the last few weeks. Since the settlement of the dock strike last month, efforts have been made by both the Oliver Mining Co. and the independents to speed up production with a view to delivering as large tonnages of ore as possible at the Lake Erie docks prior to the close of navigation. The measure of success attained is shown by shipments during September, 6,814,000 tons, despite slow operations during the first half of the month. If no further disturbing factors arise it is said ore shipments for the season from the Lake Superior district will amount to 50,000,000 tons.

It is interesting to note that the payrolls of the various operators on the ranges at the beginning of this month called for the disbursement of the largest amount of money since the season opened. The superintendent of one of the independent companies said that the wages of 500 or more miners at its mines averaged $7.30 a day during the previous two weeks, and similar information was given out by other operators.

Though operations of the Oliver Mining Co. were curtailed through labor troubles on the Vermillion range, work at its Mesaba range properties was pushed, and more than 12,500 men were employed at its mines in the Lake Superior district. It has been announced by officials of the company that a large force of miners will be employed during the winter months in development work.

Mining officials on the ranges are disturbed over the outlook for labor at the mines next season. Foreigners have been leaving the ranges at an alarming rate, more than 200 men going in one day recently from the Nashwauk, Minn., district. Letters received by the aliens urge them to return to their native countries in order to take advantage of the high rate of wages expected in reconstruction work.

The Oliver Mining Co. is facing injunction proceedings brought in the district court at Hibbing to restrain it, and the village of Hibbing from carrying out an alleged conspiracy to transfer the original business section of Hibbing to a new location, known as the Central addition, to facilitate the working of extensive iron deposits underlying the old townsite. Hibbing has been having a continuous moving day since early last spring. The mining company set out last winter to buy out the owners of improved property, and substantial sums have been paid. Many houses have been moved to the new town, and contracts involving expenditures running up into millions of dollars have been let for new structures. In view of that situation, it is generally thought that the proceedings are late. The main object of the plaintiffs is to obtain damages for loss in the value of their properties. They ask for the appointment by the court of a referee to determine the respective amounts, which they contend should not total less than $500,000.

At various places on the Minnesota ranges residents have organized clubs to promote an educational campaign in southern Minnesota regarding the unfairness of the proposed tonnage tax, the imposition of which has twice been blocked by vetoes of the governor. It is expected that the mining interests will be called on to face the tax issue again at the next session of the state legislature. The aim of the organizations is to inform the public in the southern part of the state what the effect of the tax would be on industry.

Fee owners and lesees of manganiferous iron ore properties on the Cuyuna range have been gratified by recent rulings of the tax commission at St. Paul, reducing the assessed valuation of the Clark mine for 1918 from $176,856 to $23,737, and the assessment for the same year on the Sultana mine from $151,799 to $33,309. Approximately the same action was taken regarding assessments for 1917. Similar reductions in the assessed valuations of other manganiferous or low grade ore bodies on the range are expected. Richard Hurd, the state tax commission's director of mines, in ruling on the petition to reduce the valuations, said that there never had been a normal demand for the manganiferous ores of the Cuyuna range. Production, in his opinion, was either for experimental purposes, or for the exploitation of stock. An abnormal demand was brought about by war emergency but as soon as peace was declared, Hurd said, the demand ceased. He pointed out that with one exception, every manganiferous property on the Cuyuna range has been closed down and that unless some practical means of enriching the Cuyuna ores can be found, or unless a sufficiently protected tariff can be worked out there would appear to be no chance for the successful operation of those properties. He estimated that an average of $100,000 had been spent on each of the 30 Cuyuna range manganiferous properties.

Owners of manganiferous properties on the Cuyuna range do not, however, take such a pessimistic view of the situation as does Mr. Hurd. It is claimed that the ores have been found merchantable and capable of economical treatment for the production of alloys.

Exporters Adopt Broad Policies

Favor Resumption of Trade With Germany and Russia, Improved Credit Relations, Increased Production, and Action on Peace Treaty at Earliest Possible Time—European Business Men Express Their Views at Convention

CALLING on American labor to increase its activity in order that the present standards of living in America may be maintained, and asserting that when peace is finally declared it shall be a real peace as far as trade with the central powers is concerned, the American Manufacturers Export association held its tenth annual convention in New York, Oct. 17 and 18.

During the two-days' session the convention discussed the possibility of trade with Russia and the new states of Europe, the American consular service and foreign credits. A few prominent British, Belgian and Italian business delegates were present, French industry had the larger representation, however, and all of the French delegates urged America to extend credits to Europe that the purchase of actual necessities can be made in the United States.

The call to American labor and the decision as to future trade relations with Germany were recorded in a series of resolutions adopted by the convention at its final session. In these resolutions a number of subjects of importance to American manufacturers were dealt with, and foreign trade policies were outlined. The manufacturers urged that the peace treaty be acted upon at the earliest possible moment. They recommended to congress that immediate action be taken to reorganize the diplomatic, consular and commercial services of the United States. They went on record as being willing to co-operate in the rehabilitation of Europe through the exportation of raw material and machinery, and resolved to improve the quality of American workmanship and develop facilities for increased production at home.

The urgent need of building up manufacturing organizations in this country in order that foreign trade which has come to the United States through the war may be retained was dwelt upon at length by George Ed. Smith, president of the Royal Typewriter Co., retiring president of the export association. He told the manufacturers they must expect a serious falling off in their foreign business in the near future, and should not delude themselves on that score. This same thing was hinted at by Frank A. Vanderlip, of New York; Louis E. Pierson, of the Irving National bank; Allen Walker, of the Guaranty Trust Co., and other speakers who discussed the very acute exchange situation and the necessity of organizing investment trusts or associations under the Edge law. One of the most concise expositions of the possibilities of co-operation among manufacturers to found institutions which will be able to extend foreign credits was given in a speech by Gilbert H. Montague, of the New York bar. Senator Owen, Oklahoma, showed a disposition to give way temporarily to the views of international bankers but said that when normal conditions have been restored if private bankers do not provide adequate facilities to finance foreign trade he will urge the government to lend a hand.

As a result of the rather controversial discussion of the credit situation the convention went on record for a conservative policy, expressed as follows:

That every facility should be provided by American industries and financial institutions, for the exportation to Europe of raw materials and machinery, which are essential to the revival of European industries.

That after supplying immediate and essential requirements for the rehabilitation of Europe our manufacturers should direct their selling efforts chiefly to the markets of those countries whose foreign exchange situation will not be still more adversely affected by the result of such selling efforts.

On Siberia and southern Russia the convention went on record as favoring this program:

That in behalf of American ideals and for the protection of American interests, official support in the form of economic assistance and generous credit facilities be given to the efforts of patriotic Russians, who are endeavoring to create a united and constituent country.

That in that part of Russia where life and property are secure, every effort should be made to supply the necessities of life to the Russian people.

That the American manufacturing and shipping interests and their bankers should at once unite to undertake the foregoing work.

Realizing that the extension of credits will not nearly meet the emergency of the present situation, the convention, although composed of the leading exporters of America, declared for a policy of importation of European goods.

Second in importance only to the action taken in connection with the subject of credits and Russian trade, was the expressed attitude of the manufacturing exporters on the matter of trade with Germany.

The purpose of the exporting manufacturers was expressed in a resolution, unanimously adopted, providing the following:

"When our government shall have ratified the peace treaty, the peace so concluded shall be, industrially, a real peace, and American manufacturers shall feel at liberty to resume trade with the people of the central powers in the manner that their individual interests may dictate, but in the allocation of output and the extension of credit generous consideration should always be given by the manufacturers of the United States to the needs of those peoples with whom they have been associated in the war."

Export Association's New Officers

PRESIDENT—*William Lawrence Saunders, chairman of the board of directors of the Ingersoll-Rand Co.*

VICE PRESIDENTS—*C. K. Anderson, president, American Wire Fabrics Co.; H. S. Demarest, Greene Tweed Co.; Julius Goslin, president, Joubert & Goslin Machine & Foundry Co.; J. S. Lawrence, president, Lawrence & Co.*

TREASURER—*William H. Ingersoll, Robt. H. Ingersoll & Bro.*

DIRECTORS—*Term of* 1921, *C. E. Jennings, president, C. E. Jennings & Co. Term of* 1922, *George Ed. Smith, president, Royal Typewriter Co., Inc.; Dwight Austin, managing director, Nestle's Food Co., Inc.; F. A. Seiberling, president, Goodyear Tire & Rubber Co.; Frank H. Taylor, president, S. S. White Dental Manufacturing Co.*

Confer on International Trade

Representatives of American Business Interests Meet in Atlantic City With Delegates From Iron and Steel, Financial and Shipping Houses of Europe—Credits and Exchange Rates Receive Consideration

ATLANTIC CITY, N. J., Oct. 23.—With representatives of many of the leading industrial interests in the United States and more than 40 delegates from financial and manufacturing establishments in Great Britain, France, Belgium and Italy in attendance, the international trade conference called by the chamber of commerce of the United States today began serious consideration of problems of world-wide trade relationship. The conference is of particular interest to steel manufacturers, and the delegates from European countries include representatives of some of the largest steel interests, as well as men concerned with financial and shipping affairs.

A definite understanding as to European requirements is expected to result from the conference, and such topics as credits and exchange rates are in the forefront for discussion. It is possible that initial steps will be taken toward the organization of an international chamber of commerce, as favored by the French delegation, headed by Charles Eugene Schneider, of Schneider & Co., Creusot, France, one of the most distinguished of the European representatives.

The delegates from France, England, Belgium and Italy, after the Atlantic City meeting, plan to make a tour of the United States to study industrial conditions.

Committees in charge of the various departments of the conference's program began work Monday, and the first session of the delegates was held late Wednesday. In a statement issued by the executive committee of the conference it is said that while requirements of European countries will be far in excess of the capacity of American mills to supply, larger order have not been placed in the last six months due to the unfavorable trend of exchange.

Summarizes Steel Situation

The committee authorized the following review of the steel situation in England, France, Belgium and Italy, prepared by an American expert in the foreign market for American steel.

"ENGLAND—Before the war England's finishing capacity for iron and steel products was in excess of her producing capacity, so that in 1913 she imported nearly 1,000,000 tons of semi-finished steel, which was imported from the United States, Germany or Belgium, depending upon where it could be bought cheapest. During the war her finishing capacity was much increased, and today it is probably over 25 per cent greater than her producing capacity.

"Today the books of the American mills are so full of orders for finished products that the majority of the mills require all of their semifinished steel for their own use, and while there is the same demand in England for this class of material, the quantities which the mills in the United States can furnish have been much curtailed. In the long run, this must result in the reduction of output of finished steel products in England, which will probably be reflected in the smaller tonnage that Great Britain will have to offer for export.

"FRANCE—At the close of the war, while most of the French steel mills were intact, France had a devastated district 30 miles wide along her north-eastern frontier. Here, factories had been destroyed as well as railroad lines, with all their bridges, stations and warehouses, so that France's necessities for steel were greater than those of any other European country.

"In anticipation of the award of Lorraine with its deposits of iron ore and many steel mills, and of the Saar valley with its great coal fields, the French government for the first six months after the armistice opposed the importation of steel from abroad, with a view to giving work immediately to returning soldiers. It was found that the tonnage of steel required was such that the only way reconstruction could proceed was by importing steel, and governmental restrictions were removed. As

Schneider Favors World Chamber of Commerce

ATLANTIC CITY, N. J., Oct. 22.—"In Europe we feel the vital necessity of keeping in close touch with this country," said Charles Eugene Schneider, head of Schneider & Co., Creusot, France, one of the leading iron and steel interests in Europe, who is chairman of the French delegation attending the international trade conference in Atlantic City. "We hope that the future will see our business men visiting the United States, and American business men in Europe, very frequently. Such a situation, I feel sure, would be a splendid thing and would be profitable to the nations on both sides of the Atlantic.

"I hope to see the creation of some kind of permanent organization that will bring the business and trade elements in France and America in close relationship. I hope that the establishment of a world chamber of commerce will be effected at this conference.

"I do not believe France needs steel, that is, not much steel. Some plates for shipbuilding and similar material, perhaps, will be necessary, but we are not going to ask for any huge shipments.

"The Creusot works are now operating at the greatest speed possible under the conditions. A large percentage of our factories, as well as our mines, were in German hands. It will take us two years to get the devastated regions functioning again in a business way. At our plant we are making railroad equipment and other material needed for the development of the country. We will turn out probably 300 locomotives this year. We are manufacturing some munitions of war, as we do not believe the time has come when France may safely disarm."

Monsieur Schneider added that trade with Germany would be resumed very soon, and that the first things France will want from her former enemy are iron and coal. France's greatest needs from America, he said, are coal, copper, grain and petrol.

a result, inquiries for large tonnages were received in this country, but most of them did not develop into orders because of the continued fall in exchange.

"The United States is handicapped in selling products in France, because we have never entered into a reciprocal commercial treaty which our materials would be admitted at the lowest duty, under the most-favored-nations clauses. It would seem as if this was an opportune topic to discuss with the French delegates at the conference, so that steps may be taken to have imports from the United States admitted under the minimum tariff.

"BELGIUM—When the Germans found it necessary to evacuate Belgium, they followed a deliberate policy of so crippling industries so as to make such competition impossible for years. It is said that trained metallurgists and steel-mill operators were sent from Germany to direct the looting and complete the destruction so that the mills would have to be rebuilt from their very foundations.

"Thirty steel works produced in 1913 over 2,500,000 tons of steel, of which 1,400,000 tons were rolled into rails, structural shapes, plates, etc. The iron and steel industry in Belgium is centered in the provinces of Hainout and Liege, and it was here that destruction was most complete.

"Like England's, Belgium's greatest need is for semifinished products, but her ability to buy these has been interfered with by the fall in exchange. To overcome this it is stated that a group of the most important steel works in Belgium has under consideration the forming of a holding company to negotiate a large bonded loan to buy materials and supplies.

"ITALY—Italy before the war was a particularly large importer of steel products, which came almost exclusively from Germany. Her production of steel had always been limited by lack of coal. During the war she increased her output of electric iron from 17,000 tons in 1916 to 56,000 tons in 1917, and with her enormous waterfalls it is possible the harnessing of this water power may result in partially overcoming her handicaps. For the next year or two Italy is bound to be a large purchaser of steel abroad."

The committee on metals will give special consideration to the needs of European countries. Members of this committee are:

E. A. S. Clarke, chairman, president of the Consolidated Steel Corp., New York City; O. K. Davis, vice chairman and secretary, secretary of the National Foreign Trade council, New York City; George H. Moseley, chamber of commerce of the United States, Chicago; W. A. Bostwick, president, International Nickel Co., New York City; William Butterworth, president, Deere & Co., Moline, Ill.; E. J. Cornish, president, National Lead Co., New York City; Thomas G. Cranwell, president, Continental Can Co., Syracuse, N. Y.; Walter Douglas, president, Phelps-Dodge Corp., New York City; John P. Elton, vice president, American Brass Co., Waterbury, Conn.; B. F. Jones Jr., president, Jones & Laughlin Steel Co., Pittsburgh; C. K. Leith, Madison, Wis.; John W. O'Leary, vice president, Chicago Trust Co., Chicago; Edgar Palmer, president, New Jersey Zinc Co., New York City; George N. Peek, president, Moline Plow Co., Moline, Ill.; Charles M. Schwab, chairman, Bethlehem Steel Corp.; W. B. Thompson, president, Inspiration Consolidated Copper Co., New York City; H. R. Wagner, American Smelting & Refining Co., New York City; Pope Yeatman, mining engineer, New York City.

The following committee has charge of all affairs of the conference related to reconstruction supplies which may be required in Europe:

E. W. Rice Jr., chairman, president of the General Electric Co., Schenectady, N. Y.; George A. O'Reilly, vice chairman and secretary, Irving National bank, New York City; William D. Southwick, chamber of commerce of the United States, Chicago; Charles W. Asbury, president, Enterprise Mfg. Co., Philadelphia; Max W. Babb, vice president, Allis-Chalmers Mfg. Co., Milwaukee, Wis.; C. S. Brantingham, Emerson, Brantingham Co., Rockford, Ill.; J. H. Burton, J. H. Burton & Co., New York City; C. L. Cornell, vice president, Niles Bement Pond Co., New York City; J. B. Doan, president, American Tool Work Co., Cincinnati; Dr. J. T. Duryea, president, Pierce, Butler & Pierce, New York City; Andrew Fletcher, president, American Locomotive Co., New York City; Charles A. Goodman, president, National Hardwood Lumber association, Chicago; E. M. Herr, president, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.; John J. Kaul, Kaul Lumber Co., Birmingham, Ala.; John H. Kirby, president, Kirby Lumber Co., Houston, Tex.; Alexander Legge, vice president, International Harvester Co., Chicago; Stephen C. Mason, president, National Association of Manufacturers, Pittsburgh; John W. McClure, first vice president, National wholesale Lumber Dealers' association, Memphis, Tenn.; Albert E. Newton, Reid Prentice Co., Worcester, Mass.; George A. Ranney, president, National Implement and Vehicle association, Chicago; W. W. Salmon, president, General Railway Signal Co., Rochester, N. Y.; Hamilton Stewart, vice president, Harbison Walker Refractories Co., Pittsburgh; Ernest T. Trigg, vice president, John Lucas & Co., Philadelphia.

Hold Annual Meeting

The twelfth annual meeting of the National Association of Ornamental Iron and Bronze Manufacturers will be held at the Missouri Athletic club, St. Louis, Oct. 23 and 24. An interesting program has been arranged and a large attendance is expected. Among the papers to be read are: "The Labor Problem," by W. Hume Logan; "Industrial Engineering," by H. H. McClure of L. V. Estes, Inc., Chicago; "Uniform Costs," by L. W. Robinson of L. V. Estes, Inc., and "Factory Organization and Its Problems," by C. Zimmerman. An automobile tour of the city will follow the final session.

Allot Supplies

Of Coal for Products Because of Strike Effect on Output

New York, Oct. 20.—The steel strike continues to materially affect production of benzol. Good strides have been made toward normal output of iron and steel, but the coke producing branch of the industry is still lagging with the result that the production of benzol and other coke by-products are being materially affected. The output of benzol is said to be not more than 35 per cent of normal. As a result of this situation sellers of by-products continue to allot their supplies with the utmost discretion. Prices remain unchanged. Contract benzol is quoted at 24 to 29 cents for pure material and 22 to 24 cents for 90 per cent.

Output of toluol and solvent naphtha also are affected by the strike, but as demand for these products has not been heavy of late, little difficulty is being had by consumers in covering on their requirements. Toluol is still quoted at 26 to 30 cents, f.o.b. producers' plants, on spot and contract business, and solvent naphtha, 22 to 27 cents.

Drug merchants remain active in the naphthalin market, contracting for their next season's requirements. Some fairly good buying is also being done by the dye industry. Naphthalin in flakes is holding at 6½ to 7½ cents, and naphthalin in balls at 8½ to 27 cents.

Demand for sulphate of ammonia is relatively quiet, with prices unchanged. Sulphate of ammonia for spot delivery is quoted at $3.40 to $3.65, and for future shipments at $3.25 to $3.40 per 100 pounds at producers' plants.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.40 to 3.65

Contract

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds Producers' Plants

Sulphate of ammonia	3.25 to 3.40

Appeal Ore Freight Rate Case

Independent Companies to Follow Action of Oliver Mining Co., in Asking Interstate Commerce Commission to Revoke "Spotting" Charge and to Reduce Rate From Mine to Dock, Increased by Director General

WASHINGTON, Oct. 21.—Independent ore companies and furnace interests owning ore mines are preparing to present to the interstate commerce commission petitions asking for the revocation of the "spotting" charge on ore cars and for a reduction of the freight rate from the mines to upper lakes docks. Their complaint will follow the lines of that filed recently with the commission by the Oliver Mining Co., against the director general of railroads, including the Chicago, Milwaukee & St. Paul railroad and others, among them noncontrolled lines. Ore companies appealed to the director general last spring for a modification of rates, but their petitions were denied. The charges are declared to be so unjust that by combined action it is now hoped to obtain favorable action through the commission.

The complaint of the Oliver Mining Co. is made against the director general for having terminated the former practice of applying rates from ore stock piles of the complainant in the Menominee, Gogebic, Marquette, Mesabi and Vermillion ranges in Minnesota and Michigan and for making a charge for the service of engines and engine crews for hauling in of the empty cars from the auxiliary railroad yards, setting the empties at the stock piles for loading and taking out from the stock piles the loaded cars to the auxiliary railroads. The complaint also is directed against cessation of the practice of extending prevailing rates on bituminous coal to the customary points of unloading on the coal trestles and in addition to making a charge for services of engines and engine crews for hauling loaded and empty cars to and from the trestles and for setting the cars for unloading.

It is charged that the change in rates has resulted in unreasonable charges and is in violation of section 10 of the federal control act. Request is made that the defendants desist from the alleged violations and that the commission allow reparation of $117,352.76 with interest at 6 per cent to the complainant.

For many years, the complaint says, it was the practice for the railroads to apply district rates on iron ore from the shafts or mouth of the mines and the stock piles at the places where the cars are loaded with ore. In April new tariffs became effective providing for a charge of $7.50 per hour or fraction thereof for the use of locomotives and switching crews in handling cars at steam shovels or shafts for the loading of ore from stock piles or shafts, and any other service required by mining companies, and, in addition, the tariffs provided charges for hauling the cars to the stock piles and setting for loading, and for taking the loaded cars from stock piles to auxiliary railroad yards, thereby throwing on the complainant the expense of performing a part of the service previously performed for the through district rate.

Section 10 of the federal control act was also violated, it is claimed, in advancing all the rates of iron ore from the respective districts 33.6 cents per gross ton, effective June 25, 1918, under order No. 28 of the director general. This increase, it is said, was ample to cover the full services which the carriers have been customarily rendering. The same tariffs resulted in the additional charges for delivering coal shipments.

The Oliver Mining Co. also has directed a complaint against the director general as the operator of the Duluth, Missabe & Northern railroad for increasing rates for hauling ore from mines from Arcturus to Bovey, Minn., a distance of three and one-half miles, the ore being concentrated at the latter point. Prior to June 25, 1918, the Missabe charged $5 a car for the movement of the ore between these points, but on that date the rate was advanced to 30 cents per gross ton, plus $5 a car, resulting in a car rate of $18.50. Subsequent to the effective date of the increase the complainant filed with the executive officer of the Missabe road a protest on the grounds that the increase was unreasonable, unjust and unduly discriminatory and in violation of general order No. 28 of the director general, for the reason that the subsequent movement of concentrates of crude ore at Bovey to Duluth, Minn., also bore an increase of 30 cents per gross ton. This, it is stated, resulted in the movement of the ore being increased 60 cents per gross ton from the original point of shipment. As a result of the protest from the rate assessed on the ore from Arcturus to Bovey a reduction of 30 cents per gross ton was made, plus $5 a car, to a gross rate of $6.50 per car, effective Oct. 8, 1918. The complainant seeks reparation to the amount of $95,394.26 on shipments from June 25, to Oct. 8, 1918.

Intra-City Rate Applied to Switching Service

Washington, Oct. 21.—On the theory that the service rendered was worth what the railroads charged, under the terms of the director general's rate order of June 25, 1918, J. Edgar Smith, examiner for the interstate commerce commission, has recommended the dismissal of the case of Rogers, Brown & Co., against the Pennsylvania Railroad Co. The service rendered was that of carrying limestone from a dock in Buffalo to the Hamburg turnpike, a distance of about 1.5 miles.

Under a general order the charge was increased from $2.10 per car to $2.60 per car, plus one cent per 100 pounds. On Nov. 8, 1918, the cost was reduced to $5 per car. Under the rate in effect from June 25 to Nov. 8, $28,159 was collected, while if the $5 rate had been in effect the charge would have been only $10,550. Under the old rate of $2.10 per car, the charge would have been less than half of the latter sum.

The rate was carried in a switching tariff and the complaint was drawn on the theory that it was a switching service, because yard engines and crews were used to bring the limestone from the dock to the blast furnaces. Examiner Smith held that it was an intracity, intraterminal, short-line transportation service in which there was just as much of a road haul as if the transportation had been from one city to another.

Next Congress May Provide Free Port Zones

Washington, Oct. 21.—Establishment of free zones in American ports as provided in bills before the sen-

ate committee on commerce and the house committee on ways and means has been discussed at length at public hearings. It is hoped to enact legislation of this character at the next session of congress.

The proposal to establish free zones originated with the tariff commission which prepared the first bill on the subject. In the last congress, Senator Sheppard, Texas, and Senator Jones, Washington, the former a democrat and the latter a republican, introduced bills providing for the creation of free zones in ports under certain conditions. Some opposition was caused by use of the word "free," which was suspected of interfering with the protective tariff system. As a consequence, new bills introduced by Senator Jones, Washington, and Representative Nolan, California, are being given the most consideration. These measures would establish "foreign trade" zones.

The general plan proposed is to authorize the secretary of commerce to grant permits to public corporations, representing municipalities or states, to establish free zones in ports, to which ships in international trade may resort without the necessity of paying duties on products which are not intended to enter into commerce in this country, but to be shipped to other countries, either before or after they are subjected to manufacturing processes.

Senate Bill Aims to Bar Foreign Products

Washington, Oct. 21.—A bill introduced in the senate recently by Senator Smoot, Utah, aims to prevent the "dumping" of foreign products in the United States. It evidently is intended chiefly to prevent Germany from unloading in American markets quantities of dyestuffs and similar articles at lower prices than the home cost of production. So far as Germany is concerned, however, it is pointed out that the depreciated German mark will not make it necessary for the manufacturer in Germany to sell his goods in markets of this country at lower prices than his cost of production. He will be in a position to pay his labor in German marks but to sell his goods in the higher values of the currency in the markets to which he exports, giving him an advantage.

The Smoot bill would be administered by the tariff commission, which also would have authority to exclude foreign merchandise, and by reason of this German or other foreign goods could be kept out of the country.

Gary's Stand

For the Open Shop is Indorsed by Implement Manufacturers

The National Implement and Vehicle association has placed itself solidly behind the leading steel interests of the country in the present fight for the open shop. The following telegram of confidence and approval was sent to Judge Gary of the United States Steel Corp. at the closing session of the annual convention of the association at Chicago, Oct. 15 to 17:

"This association, assembled in annual convention, expresses to you its unqualified approval of the stand you are maintaining for the open shop in industry. We are unalterably opposed to any policy which requires employers to deal with anyone other than their own employes, individually, collectively or by representation from their own ranks. This association assures you of its hearty support to this end."

Under the head of industrial freedom the association declared in resolutions adopted that the high cost of living is at the bottom of labor unrest and that this results from lowered production. Therefore attention must first be given to adequate production before improvement can be expected. The open shop is declared necessary for large production at the same time conceding to labor the right to organize but not to the extent of infringing on the superior rights of fellow employes and of employers to contract with each other on terms mutually satisfactory. Shortening of the working day is opposed as tending to decrease production, this leading to disapproval of the demands of miners for a 6-hour day and a 5-day week. The statement of principles to govern the employment relation in industry as submittted by the employers' group in the industrial conference was indorsed.

Unusually large attendance marked this convention.

H. M. Wallis of the J. I. Case Plow Works was made president of the association, and W. H. Stackhouse of the French & Hecht Co., Springfield, O., succeeds him as chairman of the executive committee. Vice presidents were named as follows: W. S. Thomas, Thomas Mfg. Co., Springfield, O.; L. Clark, Samson Tractor Co., Janesville, Wis.; C. M. Burdette, Sharples Separator Co., Chester, Pa.; John Van Nortwick, Appleton Mfg. Co., Batavia, Ill.; E. V. Jones, Bailor Blow Co., Atchison, Kan.; W. H. Ronninger, Banner Buggy Co., St. Louis; A. V. Burch, Blount Plow Works, Evansville, Ind.; H. S. Chapman, Field Force Pump Co., Elmira, N. Y.; S. L. Gillette, Minneapolis Steel & Machinery Co., Minneapolis; J. A. Martin, Piedmont Wagon Co., Hickory, N. C.; R. H. Yale, Plattner-Yale Mfg. Co., Lincoln, Neb.; A. E. West, Port Huron Engine & Thresher Co., Port Huron, Mich.; Finley P. Mount, Advance Rumely Co., Laporte, Ind., and R. W. E. Hayes, Hayes Pump and Planter Co., Galva, Ill., were added to the executive committee.

Hardware Producers Join Against Agitators

At the convention of the American Hardware Manufacturers' association held at Atlantic City, N. J., Oct. 14 to 17, inclusive, a resolution was adopted commending the refusal of the United States Steel Corp. to deal with "labor agitators" and also indorsing the "12 points" of the industrial conference now in session in Washington. A communication forwarded to Judge E. H. Gary, read in part:

"It is the sense of this association that the employer in this instance appears to be not only justified in, but should be commended on account of the position assumed against the demands made by professional labor agitators and so-called representatives of labor to the end that what we believe to be a great majority of its honest, loyal and capable employes, (whom we understand are not in sympathy with the agitation which has forced this issue) may be permitted to continue unmolested the present mutually satisfactory working conditions and relations with the industry, in which so many of them enjoyed a financial or stockholding interest."

Some of those attending the convention, speaking in general terms, said that while wages in American industry have doubled, the present efficiency is only 60 per cent of that of prewar times. One prominent delegate, when asked if there is any likelihood of a reduction in prices, said that he feared present prices would prevail indefinitely.

Frank H. Payne, Greenfield, Mass., was elected president of the association. Robert H. Tremain, Ithaca, N. Y., was re-elected president of the National Hardware association, comprising the jobbers.

Two new manufacturing enterprises have been chartered in Atlanta, Ga. The Pomeroy Mfg. Co., with an authorized capital of $1,000,000 will make smoke consumers, water softeners and roller friction clutches. The Railway Lock-Spike Co., also capitalized for $1,000,000, will make railway spike systems of a new design.

Gary Refuses to Arbitrate Strike

Defeat of Gompers Resolution by Industrial Conference Expected After Firm Speech by Chairman of Steel Corporation—O'Leary Makes Clear Statement of Employers' Position—Body's Future Course is Indefinite

WASHINGTON, Oct. 21.—While not unexpected, Judge E. H. Gary threw a bombshell into the deadlocked industrial conference yesterday when in his first and only speech to that body, he reaffirmed the position of himself and the United States Steel Corp. in refusing to arbitrate the steel strike.

Judge Gary's brief speech and a short one by Samuel Gompers in reply were the only ones made before the conference today, the remainder of the entire period being given over to an executive session of the employers' group, which some had expected might concede some of labor's demands. Washington is now at a loss to know what the future of the conference may be. The indefiniteness of the situation resulted not only from Judge Gary's stand, but from a statement at the White House that the President will see the conference complete its work if he has to appoint an entire new set of delegates.

Chairman Sets Rules Aside

Judge Gary's speech under the rules of the conference, really was out of order, as none of the employers' group was in the hall at the time Chairman Lane called the afternoon session to order. The rules provide that a majority of each group must be present, and the morning session of the conference was not held because none of the employers were in their seats when the roll was called. In the afternoon, however, Chairman Lane let the rules go by the board, and as soon as the meeting was in order Judge Gary arose and made his brief but pointed statement.

The paragraph dealing with unorganized labor made a particularly sound impression upon his hearers, including several in the public group and if the employers' representatives, who were in executive session at their headquarters at the time, required moral support from the steel industry, Judge Gary's statement on unorganized labor alone would have given it.

The conference yesterday, both before and after Judge Gary's speech, was practically where it was when it began functioning a week ago. Last week was given over chiefly to a discussion of the question of collective bargaining which had been raised in a resolution from the general committee to sidetrack the Gompers resolution which called for arbitration. The Gompers resolution, as a result of Judge Gary's statement undoubtedly will be defeated now, and it is possible that it will not be called up again.

The general committee, following adjournment yesterday afternoon was unable to meet because the employers' representatives were in session with their group. The committee met this morning to try to reconcile the groups on an acceptable collective bargaining resolution. The committee also spent all day Sunday on this task and was unable to accomplish anything. After Judge Gary made his speech the opinion was that the committee could only report some sort of resolution with but a recommendation. Judge Gary's speech follows:

"I desire to make a brief statement in relation to the question under discussion, as well as others submitted to this conference. Further explanation of any vote I may register will probably be unnecessary.

"Like other members of the conference, I recognize the public interest must always be considered as of the first importance, that all private interest must be subordinated. I am heartily in accord with the desire of the President to firmly establish proper and satisfactory relation between all groups of citizens connected with industry, including, of course, what has been designated as capital and labor. I believe in conciliation, co-operation and arbitration, whenever practicable without sacrificing principle.

Stands Firm for Open Shop

"I am of the fixed opinion that the pending strike against the steel industry of this country should not be arbitrated or comprised, nor any action taken by the conference which bears upon that subject. Also, that there should be maintained in actual practice, without interruption, the open shop; as I understand it, namely, that every man, whether he does or does not belong to a labor union shall have the opportunity to engage in any line of legitimate employment on terms and conditions agreed upon between employe and employer.

"I am opposed to a policy or practice which unnecessarily limits production, increases cost, deprives the workman from receiving the highest wage rates resulting from voluntary and reasonable effort, hinders promotion or advancement in accordance with merit, or otherwise interferes with the freedom of individual action.

"As unorganized labor, which embraces the vast majority of working people, has no special representation in this conference, I deem it appropriate to say that all labor should receive due consideration, and that it is the obligation, and ought to be the pleasure of employers at all times and in every respect to treat, justly and liberally all employes, whether unorganized of organized."

O'Leary Presents Employers' Side

The employers' viewpoint was expressed in a clean-cut way in a speech before the conference last week by John W. O'Leary, of Chicago, president of the National Metal Trades association, a member of the employers' group. Members of the labor group had sought to obtain hasty action by the employers' group on one of the resolutions providing for collective bargaining. Mr. O'Leary said:

"It was not entirely pleasant yesterday, sitting over here and being told how short-sighted we were, how unfair we were, how little we had of that human sympathy, as expressed by some of those who talked to us. It was not pleasant, and you know it; particularly when we realize that if you stopped for a moment, you who criticized us would have realized that as employers of labor no one could understand better the real value and meaning of contentment and happiness and cordial feeling in the employment relation than those who depend upon it for that vital necessity of industry, production. You cannot secure efficient production on the basis of strained relationship. So if you are not charitable enough to give us credit for human feeling, at least understand that from a dollars-and-cents viewpoint we know that a cordial and happy and contented relationship is the only relationship on which American industry can proceed.

"I have mixed with the men in this group sufficiently since I have been here to have a keen sense of the sincerity which prompted them to come and accept a duty which none of them desired personally. It was because they hoped we might approach this problem with a keen realization that our troubles in the past had

been based on misunderstandings, and that if we are to write a constitution for industry it must be so written that the misunderstandings of the past might be cleared. With this sincere desire to establish a relationship based on a clear understanding, we pleaded that no outside issues be inserted, and that there be no pressure to consider a specific subject.

"This question is not confined to one thing alone, nor to one plan alone. The whole program underlies it, and it should be considered on the basis of a whole program. So when you ordered the committee of fifteen to report in 24 hours a conclusion on the most vital of the various elements composing this constitution, we felt that we, as American citizens looking toward the future of our nation, could not undertake that particular assignment and offer to you something of which we might be assured we would stand on as protecting not our interests, but the interests of the United States.

Seeks Honest Investigation

"Let me take just a moment to recite to you the proceedings. The committee of fifteen met the general committee. We knew that we had one thing to deal with. We had discussed previously our procedure on these various subjects, so that there would be assembled in each instance the various resolutions and suggestions offered by members of the conference, from whatever group they might come, and that they would be brought together on the one subject, and all put before us for consideration.

"The labor group offered the platform which has been presented to this conference, and in a wonderfully clear way expressed their support of those principles. They suggested that no better language could be used, and we might do well to adopt that language. Some of us were familiar with the misunderstandings that had occurred in the past under that very language, and we desired to present other things that might be used. I am sure we were all impressed yesterday with the sincerity and depth of feeling in Mr. Rockefeller's splendid presentation. It seemed to me to be an echo of the sentiments of the men in my group.

"I asked whether or not we might have considered the resolution which expressed Mr. Rockefeller's views, as one of the methods of determining what our action should be on collective bargaining, but there was a feeling that we must adhere to the language which has been suggested, with as slight departure therefrom as possible, and the Rockefeller resolution did not follow that form.

"There was no discussion of the matter until the next morning. I again suggested that we take up the Rockefeller resolution, but things were pressing us so rapidly that I am sure the members did not quite comprehend what we were trying to accomplish in bringing forward these other thoughts, and it was not until an hour or two before the meeting yesterday that the Rockefeller resolution was ever read for the committee of fifteen. Now, that is no criticism of my fellow members on the committee of fifteen. It is rather a statement which will bring home to you the tendency which may come from abrupt and hasty action. You cannot consider many things if you only have a few minutes to consider them, and you must take a position which is not always a sound one.

"We felt that we had done all that was possible in trying to present to this conference the entire proceeding in an orderly manner, in affecting a constructive program; and I want to say to my fellow delegates unless we do proceed to consider this program on an orderly basis we will go forth from here not as a constructive agency but as a destructive one. It is not conceivable that we could do otherwise.

"I might spend time in denying statements made yesterday, but I am not going to. I could take issue with a speaker who stated there were more strikes in unorganized industry than in organized. I could take issue with anyone who stated that England has maintained her industrial position on almost complete union domination. I could take issue with the statement that a majority of American workingmen desire membership in trade unions, even though it were made by my esteemed colleague, Mr. Johnston. I might take issue with the statement that better relationship is established by outside representation. I might take issue with anyone who made the statement that more efficient production results through the trade union form of organization; but these things are open to all of us. Honest investigation will bring forth the facts. I do not ask you to take my statement, but I do ask you not to accept a statement to the contrary. I am quite content to rest on the facts as they come.

Do Not Deny Right of Bargaining

"Now, the question comes to some: 'Well, why not accept these principles?' Mr. Sheppard has indicated that is the view we ought to take. After all, we never have denied the right of organization. I have not heard anyone deny it yet. After all none of us here, or in most places that I know of, have ever denied the right of collective bargaining, as we understand collective bargaining.

"I have not heard many people deny the other point in the resolution in regard to freedom of conduct. It seems to be pretty generally accepted. Then, why not not accept these things as they are written? Because experience has shown us that the interpretation put on a vague statement is contrary to the thing which I feel it means, and if industry is to proceed upon a proper basis, a cordial basis, we must have understanding of meaning rather than misunderstanding.

"I cannot close without commenting on what I consider a most unfortunate and unfair statement which has been made here several times that would seem to indicate that we must take immediate action. I am not so convinced that the situation will end in revolution. Secretary Lane said in his opening remarks that this nation will not stand for revolution, and I believe and I hope the gentlemen will consider this very carefully. My abiding faith in the fundamental soundness of the American working man, and I include all of them, leads me to know that when he has the whole statement and the whole truth he can be relied upon to stand by the nation. Revolution in the United States is unthinkable. Men have been too long free agents. Men have lived too long under this flag of ours to ever consent to be brought into any movement which would destroy the nation that they love, and I hope we won't talk about that; but if we must talk about it, I want to remind you that the cure which the men who mention it offer seems to me belittling the nation that we serve.

A Cure for Industrial Ills

"What is the cure that is offered? That to save us from impending disaster we must strengthen by all the force that is in us one organization which is only one part of the citizenship of the United States. And I say that without any ill-feeling against that organization. I will guarantee that the majority of the members of that organization will stand fast to the principles of the United States, just the same as the majority of all the other citizens of the United States; but because an organization, representing a portion of our people, has in some instances lost control for the time being of some small portion of its people I cannot conceive that we are willing, as American citizens, to believe that the only way in which we can save this nation is by strengthening that machine.

"I have no objection to it being strengthened if the things which it offers are the things which the men want. Then, I say voluntarily, they shall have the privilege of strengthening it. But I hold as we are facing this particular thing that we talk about in this peculiar way, my faith is in the United States, in the government of the United States, and not in the employers, employes or the public alone. The sovereignty of government will be protected by the government; and I hope you will bear that in mind when we are urged that we must proceed hastily. Far better will it be, Mr. Chairman, if we proceed carefully and avoid any particular errors.

"In closing I just want to express this view of the employers' group. We presented to you a statement of what we considered the fundamental requirements of American industry. During all of our sessions we have never insisted upon the particular use of the language which we used, so long as the statement is clear. We are not going to get ahead so long as we leave loopholes for misunderstandings. Let us be frank. Let us have what we are brought here to get, a common ground, a ground of understanding rather than misunderstanding; and on that basis I believe you will find the employers' group will stand throughout this conference."

Ore Distribution

From Lake Superior District in 1918 Shown in Detail by Map

Sources of supply and channels of distribution of Lake Superior iron ore, concerning the details of which there frequently is demand for information, are graphically illustrated in a map prepared by the Lake Superior Iron Ore association. Tonnages given are for the season of 1918.

The map shows that 40,000,000 tons were shipped from the Mesaba range by water route, the only all-rail shipments from the range having been 30,000 tons to St. Louis and 10,000 tons to Mayville, Wis.

The Gogebic range poured 7,500,000 tons into the great artery of lake traffic, the Cuyuna range, 2,400,000 tons; Vermillion, 1,170,000; Menominee, 6,300,000, and the Marquette range, 3,400,000. A total of 50,400,000 tons of ore from the Mesaba, Gogebic, Vermillion and Cuyuna ranges was floated on Lake Superior, which with 3,400,000 tons from the Marquette range and 80,000 tons from Michipicoten, Canada, was increased to 53,900,000 tons floated. Rail haulage from Sault Ste. Marie reduced the total afloat to 53,200,000.

From this point 10,200,000 tons were diverted into Lake Michigan, this supply being augmented by 1,300,000 tons, shipped from the Menominee range in Michigan. Of the total 11,500,000 tons floated on Lake Michigan, 200,000 tons went to Milwaukee and 11,300,000 tons to Chicago, Indiana Harbor and Gary.

Forty-eight million, three hundred thousand tons were shipped across Lake Huron and then unloaded at ports as follows: Four hundred thousand tons at Detroit, 2,600,000 tons at Toledo, of which 2,000,000 were shipped to furnaces in southern Ohio; 1,600,000 tons at Huron, all going to eastern Ohio and western Pennsylvania furnaces; 3,500,000 tons at Lorain, 2,200,000 tons proceeding inland; 9,600,000 tons at Cleveland, 6,800,000 proceeding inland; 1,800,000 tons at Fairport, 1,800,000 tons at Ashtabula and 6,600,000 tons at Conneaut, all proceeding inland; 1,700,000 tons at Erie, Pa., 1,500,000 proceeding inland, leaving 8,800,000 tons unloaded at Buffalo, 4,700,000 tons being consumed by furnaces in that city and 3,800,000 going by rail to furnaces in central and eastern Pennsylvania.

The distribution of ore by rail shipments shows some marked contrasts in mileages. While most of the rail haulages are centered in eastern Ohio and Pennsylvania, the longest shipment was from Sault Ste. Marie to Nova Scotia. Ore also was shipped from the Mesaba range to St. Louis; from the Gogebic range to furnaces at Sligo, Mo., and from the Marquette range to a charcoal furnace at Midco, Mo., the latter being a distance of approximately 700 miles.

Comparison of the map and its data with a similar map showing distribution in 1909, prepared by John Birkinbine, shows that while 33,000,000 tons of ore were carried through the artery of Lake Superior in 1909, in 1918 the tonnage was 50,400,000. In 1909 the tonnage traversing Lake Michigan was 6,900,000; in 1918, 11,500,000. In 1909 that on Lake Huron was 33,700,000 tons, while in 1918 it was 48,300,000.

To Use Powdered Coal

New sheet mills being installed by the Mansfield Sheet & Tin Plate Co., Mansfield, O., will be fired with powdered coal. For this work the Quigley air transport system for distributing powdered coal, together with Quigley powdered coal feed controllers, burners, etc., will be used. The engineering work in connection with this equipment is being carried on by the Quigley Furnace Specialties Co., 26 Courtlandt street, New York City. The extensions of the Mansfield plant comprise six mills, four of which are being installed at the present time.

Welders to Meet

The American Welding society will hold a meeting at 8 o'clock, Oct. 24, at the Engineering Societies building, 33 West Thirty-ninth street, New York. Comfort A. Adams, president, will make an address and the program is comprised of the following papers: "A Theory of Metallic Arc Welding," R. C. Hudson; "Repairing a Lighthouse," by J. H. Deppeler; "Gas Welding During the War," H. S Smith; "Gas Cutting," F. E. Rogers; "Electric Resistance Welding," P. T. Van Bibber.

Following the papers and discussions, a moving picture entitled "Repairing the Northern Pacific" will be shown.

Hoist Builders to Meet

The Electric Hoist Manufacturers association will hold its next meeting at the offices of the Yale & Towne Mfg. Co., 9 East Fortieth street, New York City, on Tuesday afternoon, Oct. 28, at 2 p. m. C. W. Beaver, of the Yale & Towne Mfg. Co., is chairman, and W. C. Briggs, of the Shepard Electric Crane & Hoist Co., is secretary and treasurer.

Executives Inaugurate Training Course

The Simplex Wire & Cable Co., Boston, has just inaugurated a plan of training for its foremen and other executives. This company has recognized the importance of training for its men who hold supervisory positions, and it has laid out a program which promises to result in increased production and a more efficient factory organization. A group of 35 men have enrolled in a course which covers teamwork, handling men, organization, machinery and materials, production records, and management. The group includes the president, treasurer, and the factory manager.

The course will comprise the systematic study of text books on the subjects enumerated and the solution of typical factory problems relating to the texts. Meetings of the men enrolled in the class will be held in the plant every two weeks for three months, and there will be a short lecture delivered at each meeting. The foremen themselves elected to have this training installed and they plan to make it the leading feature of their meetings this fall. The training is under the supervision of the Business Training Corp., of New York, and the lectures will be given by the staff of that company.

To Retire Stock

The Sumner Iron Works, Everett, Wash., has filed notice of its intention to redeem and retire $100,000 of preferred stock, leaving the capital stock at $200,000. It is stated that the company now has an indebtedness of but $60,000. The retirement of the preferred stock of the company recalls that this was issued at the time the plant was burned six years ago. The company received offers of aid from several cities. The city of Everett raised $100,000 and the plant was rebuilt there.

To Build Tube Plant

Youngstown, O., Oct. 20—Construction work will be started immediately for the new plant of the Phenix Tube Co., at Warren, O. The company's plant now is located at Brooklyn, N. Y., but the officials plan to move it to Warren about Jan. 1 when the new buildings are expected to be completed. The Phenix company specializes on the manufacture of steel tubing for automobiles, bicycles and beds. S. A. Snell, formerly general manager of the Ohio Steel Products Co., Niles, O., has been appointed plant superintendent.

Congress Plans to Educate Aliens

Bills for Federal Aid and Co-operation With States in Americanization Work Being Pushed by Senators Who Investigated the Steel Strike—Attorney General Palmer Opposes Any Sweeping Ban on Immigration

WASHINGTON, Oct. 21.—Following their investigation into the steel strike in the Pittsburgh district where they found a large proportion of aliens in the steel industry were unable to understand or speak the English language, members of the committee on education and labor have determined to speed up action on Americanization bills before them.

The committee expects to meet tomorrow to consider three bills. Two of them were introduced by Senator Hoke Smith, Georgia, and the other by Senator McKellar, Tennessee, both members of the committee. The Smith bills were introduced several months ago, while the McKellar bill was launched after the senator returned from Pittsburgh.

Action to Come Later

It is not thought the bills can be passed at the present session of congress but it is hoped to obtain early action on them at the next session. In the meantime consideration has been given by the senate committee on judiciary to a plan to have congress authorize the department of justice and the state department to issue regulations governing immigration to prevent entrance of undesirable aliens, particularly those with radical views in regard to government. Attorney General Palmer has made it plain that he is opposed to legislation considered the past week in congress for a sweeping restriction of immigration.

It is probable that at the next session a comprehensive immigration bill will be passed, although there appears to be considerable sentiment in favor of the more drastic measures now before congress.

One of the Smith Americanization bills relates to illiterates over 16 years of age. It provides for a system of instruction through co-operation between the federal government and the states. The secretary of the interior, through the bureau of education, and in conjunction with any other federal agencies which could aid, would be directed to co-operate with the states in the education of aliens unable to speak, read or write the English language, and in the training of teachers and supervisors, and directors for such educational work. The bill would appropriate $12,500,000 annually until 1926 for the payment of salaries. For preparing them it would appropriate $750,000 annually for the term mentioned.

Conditions of Appropriations

These appropriations would be made available only in the event that each state or municipal corporation appropriated an amount equal to that allotted by the government.

The bill would require instruction for not less than 200 hours each year of all minors over 16 years of age unable to speak, read or write the English language, at schools or by other methods of elementary instruction, until such minors have completed a course in English equivalent to that supplied by third-grade schools.

Money would be allotted to a state in that proportion which the total number of foreign-born illiterates, 10 years of age and over, in that state bears to the total number of illiterates in the United States, exclusive of the District of Columbia, according to the latest United States census. Each state would be required to submit to the secretary of the interior for his approval plans showing the manner in which it is proposed to use the federal appropriation.

The bill also provides an appropriation of $250,000 for the fiscal year ending June 30, 1920, and $1,000,000 annually thereafter until 1926, for the purpose of administering the act, for investigations, studies, salaries of officers and assistants, furniture and equipment, printing, etc.

Would Create New Department

The other Smith bill creates a department of education. For the support of the department for the fiscal year ending June 30, 1921, it would appropriate $500,000, while "in order to encourage the states in the promotion and support of education" it would appropriate for the present fiscal year $100,000,000. Three-fourths of this amount would be used for the instruction of illiterates of 10 years and over, the instruction to "deal with the common school branches and the duties of citizenship, and when advisable to prepare for some definite occupation."

This section of the bill refers to native and not foreign-born illiterates, but section 9 provides that "in order to encourage the states in the Americanization of immigrants, three-fortieths of the sum authorized to be appropriated shall be used to teach immigrants 10 years of age and over to speak and read the English language and to understand and appreciate the spirit and purpose of the American government and the duties of citizenship in a free country."

It is further provided that five-tenths of the sum authorized shall be appropriated for the partial payment of teachers, for providing better instruction, extending school terms, etc., especially in rural schools, and in schools in sparsely settled localities.

Must Speak English Clearly

The McKellar bill is designed to provide for the education and naturalization of aliens and children of aliens. It provides that hereafter no alien shall be permitted to reside in the United States for a longer period than five years without becoming naturalized. Aliens would be admitted to citizenship at any time after three years' residence in the United States and one year's residence in the state in which he makes application for admission. No alien would be admitted to citizenship without being able to speak enough English to make his desire to become a citizen clearly intelligible to the judge to whom the application is made, in addition to having the qualification required by existing laws.

The bill also would require individuals and corporations employing as many as 30 aliens to provide at least one hour's instruction in the English language for five days in a week during a period of six months a year. It is provided, however, if a state, county or municipality furnishes night or day schools giving aliens such instruction employers shall include in the alien's time of work one-half hour so devoted to such education and pay for his time at the existing scale of wages. Children of aliens would be taught in English-

speaking schools. Aliens making application for citizenship would be required to tell the judge their views on government, and if their views conflicted with American principles they would be denied citizenship.

House Votes to Exclude Alien Agitators

WASHINGTON, Oct. 21.—Passage by the house last week by a vote of 314 to 1 of the bill to curb the activities of radical agitators and bolsheviki is expected to be followed by similar action soon in the senate. This legislation advocated by President Wilson and Secretary of State Lansing, is designed to maintain for a year the restrictions imposed as a war measure on immigration to the United States.

The legislation is in effect the same kind as as that which the senate committee on judiciary has been considering partly as the result of the investigation by the senate committee on education and labor of the steel strike. Members of the latter committee believe the measure will serve to exclude undesirables until congress can pass a comprehensive immigration law.

The state department urged action on the bill on the ground that there is great unrest and disorder throughout Europe and that many persons seeking admission to this country just now are engaged in propaganda against American institutions.

While the bill may prove effective, it is pointed out that the existing immigration law, passed in 1917, apparently is adequate to shut out from this country immigrants advocating anarchistic doctrines. This measure requires the literacy test, and is understood to cover a great many of the things now being sought by further legislation.

Despite the seeming confusion of laws, however, it is probable that much more discrimination will be exercised in the future.

The only vote against the bill passed by the house was cast by Representative Gallagher, Illinois, but there probably were other representatives who feel that present laws are adequate to cover the purpose intended.

Representative Cooper, Youngstown, O., a union labor man, who strongly upheld the bill recommended by the state department, declared that foreign agitators are responsible for much of the trouble in connection with the steel strike. He declared that it is time to make "America safe for Americans," and added that many American workmen have been threatened during the steel strike.

"I live in one of those great industrial districts that is now suffering from the steel strike, and I have on my desk sworn affidavits of some of the statements made to the workmen by these bolshevists and agitators that have been permitted to come into our country," he said. "They threaten American citizens if they go to work. The agitators are not citizens of the United States, but they come here with the spirit of bolshevism imbued in their hearts and minds and today they are appearing and preaching their doctrine to American workmen.

"The time has come when we have got to call a halt on the bolsheviki and agitators. We must call a halt upon this hellish doctrine that is being preached in our country by the followers of Lenine and Trotsky, and I know of no better way to stop it than to prohibit these men from coming to our land.

"Have we come to that stage in our national life when an American citizen, who loves his country, who has been a valuable asset to the community in which he lives, who has built himself a little house, who is trying to educate his children along the line of true American principles, and who wants to go to work, is threatened by one of these aliens who sticks a knife or a gun under his nose and says, 'I will kill you if you go to work.'

"Where does the protection come under the constitution of the United States? It is time we were taking some action along this line."

Labor Shortage Handicaps Malleable Industry

In connection with the insistent demand for malleable castings, the American Malleable Castings association reports that this condition has been anticipated and that ample facilities have been provided for both the present and future expansion of the industry.

It is stated, however, that at present the shortage of unskilled labor will not permit full use of the capacity. Fully 200,000 tons of malleable capacity is idle but would be immediately available if the necessary labor could be secured.

Improvement in this direction is not looked forward to with any great hope until the activities of other industries are curtailed or until there is a flow of immigration sufficient to build up the supply of labor available for foundry work. This means a large percentage of capacity idle continuously in every plant regardless of heavy unfilled orders.

Mid-West Meet

Of A. S. M. E. Will be Held Oct. 24 and 25 at Indianapolis

Industrial unrest and research are the subjects to be discussed at the joint meeting of the midwest sections of the American Society of Mechanical Engineers to be held Oct. 24 and 25 at the Claypool hotel, Indianapolis. The participating sections will include Birmingham, Chicago, Cincinnati, Cleveland, Detroit, Indianapolis, Milwaukee and St. Louis.

Registration will begin at the Claypool hotel at 9 a. m., Oct. 24 and at 2 p. m. a professional session devoted to industrial unrest will be held. The following papers will be presented: "Industrial Unrest," by Maj. W. C. Rogers, St. Louis; "Successful Methods for Improving Human Relations in Industry," by C. F. Scribner, Chicago; "The Results of Americanization Carried Out by the Commonwealth Edison Co., by A. D. Bailey, Chicago; "Training of Students in Industrial Management," by B. W. Benedict, Urbana, Ill.; and "Industrial Medicine," by O. P. Geier, Cincinnati.

At 6:30 p. m. a banquet will be held. Addresses will be made by M. E. Cooley, president of the American Society of Mechanical Engineers and Willis A. Moore, Cleveland. A professional session devoted to the subject of research will be held at 9 a. m., Oct. 25. The following papers will be presented: "General Consideration of the Present Status of Research in the Industrial Life of the Country," by Lieut. Col. C. F. Hirshfeld, Detroit; "The Administration of Industrial Research Affairs," by R. E. Carpenter, Cleveland; "Industrial Research," by Walter A. Spear and L. G. Robinson, Cincinnati; "Research in the Nela Park Laboratory," by E. P. Hyde, Cleveland; "Present Status of Ratigue of Metals Phenomena," by H. F. Moore, Urbana; "Design of

Purdue University Tractor Testing Plant," by C. H. Benjamin and G. C. King, Lafayette, Ind.; "Research," by G. S. Hessenbruch, St. Louis, and "Pure Science and Engineering Research," by J. R. Allen.

Staff of Edgar T. Ward Holds Annual Meeting

The first annual sales convention of the Edgar T. Ward's Sons Co. was held at the William Penn hotel, Pittsburgh, Oct. 13 and 14, and brought together not only the officers and district sales managers of this company but practically the entire sales forces of the various branches of the company which are located in Boston, Chicago, Detroit, Newark, N. J., New York, Philadelphia and Pittsburgh. The Edgar T. Ward Sons was founded in 1882 in Boston and continued in business under that name until 1918, when a new firm was organized under the name of the Edgar T. Ward's Sons Co., which was a combination of the company with the Boston Steel & Wire Co., Boston; the George Nash Co., with offices in New York and Chicago; Wilworth, Lockwood & Co., with offices in New York and Newark, N. J., and Field & Co. of Philadelphia.

The program for the first day's session consisted of an address of greeting by John Ward, treasurer of the company; "The Company's Facts and Problems," by James S. Winn, vice president; "Eye-opening Facts on Tool Steel," by G. H. Neilson, vice president and general manager; "Analyses of Steel," by H. W. Wills, metallurgist of the Braeburn Steel Co.; "Co-operation," by Herbert W. Lockwood, manager of the New York branch of the company; "The Downs Drill," by W. R. Down; "Die Blocks: Grades and Uses," by H. F. Jordan, Pittsburgh district sales manager; "A Tough Customer," by H. F. Gillette and H. M. Lutz. Discussions and "get acquainted" periods came during the day and in the evening, following dinner, the entire party attended a performance at one of the Pittsburgh theaters.

The Tuesday morning program consisted of a tour of inspection of the plant of the Braeburn Steel Co. at Braeburn, Pa., with lunch at the company's plant. A baseball game scheduled for the afternoon between teams made up from the eastern and western offices of the company was cancelled because of rain. The convention concluded with a banquet at the William Penn hotel at which H. W. Lockwood, secretary of the company, was toastmaster.

The officers of the company are: President, Edgar Ward, Boston; vice president, J. S. Winn, Chicago, and Leslie Edgcomb, Philadelphia, treasurer, John Ward, Boston, assistant treasurer, E. P. Hall, Boston; secretary, Herbert Lockwood, New York; Clerk, W. E. Adams, Boston. The sales policy board of the company comprises John Ward, E. P. Hall, E. B. Lapham, G. H. Neilson and H. L. Edgcomb. The district sales managers of the company are W. E Adams, Boston; E. B. Lapham, Chicago; W. F. Ruelman, Detroit; W. S. Ganong, Newark, N. J.; H. W. Lockwood, New York; H. L. Edgcomb, Philadelphia, and H. E. Jordan, Pittsburgh.

Obituaries

GEORGE W. JOHNSON, a conspicuous figure in manufacturing circles in western Pennsylvania, died on Oct. 12 at his home in New Castle, Pa. He was born in Clarksville, Mercer county, Pa., 72 years ago and moved to New Castle in 1880. He conducted the Arethusa Iron Works from 1885 to 1899 when it was sold to the American Sheet & Tin Plate Co. Mr. Johnson had large interests in limestone quarries and mines in Lawrence, Butler, Armstrong and Blair counties, Pennsylvania, as well as in Maryland and in West Virginia. He also controlled the Johnson Bronze Co., New Castle, Pa.

Nathaniel G. Manson, for many years engaged in the iron business in Boston, died at his home in Greenland, N. H., Oct. 5, aged 77 years.

Walter W. Pharo, president and treasurer of the Belmont Iron Works, Philadelphia, and president of the Tuckerton railroad, died recently at Beach Haven, N. J. He was a graduate of Haverford college, class of '76 and was a member of the Merion Cricket club and the University club. His home was at Haverford, N. J.

Julius Blackburn, who was connected with the Carnegie Steel Co. for the past 30 years and latterly had held an executive position in the assistant treasurer's office in Pittsburgh, died recently following an illness of several months. Mr. Blackburn, who was 51 years old, was a native of Hollidaysburg, Pa., but made Pittsburgh his home for the past 30 years. His brother, W. W. Blackburn, is secretary of the Carnegie Steel Co.

Benjamin F. Compton, superintendent of the brass foundry at the Bethlehem Steel Co.'s Bethlehem plant, for the past 10 years, died Oct. 9 at his home in Bethlehem. He was 62 years of age. Prior to his connection with the Bethlehem Steel Co., he had charge of the brass shop of the William Cramp & Sons Ship & Engine Building Co., Philadelphia.

Clayton S. Stevens, New Britain, Conn., designer of machinery, died in the New Britain General hospital, Sept. 27, aged 60 years. Before going into business for himself he was a designer of automatic machinery for the Stanley Works and for a long time was in charge of the "H. H." plant of the works, resigning several years ago on account of ill health.

Frank G. Goodale, for the past 13 years mechanical engineer for the Parker Wire Goods Co., Worcester, Mass., died in the Holden Cottage hospital, Holden, Mass., Oct. 5, aged 45 years. Before going with the Parker Wire Goods Co. he was a foreman for seven years at the South works of the American Steel & Wire Co. in Worcester.

Robert Neil Dickman, Chicago mining engineer, died at La Jolla, Cal., Sept. 14, following an operation. Mr. Dickman was of the former mining engineering firm of Dickman & MacKenzie. Mr. MacKenzie was killed in 1905 by Yaqui Indians while on business in Mexico. Mr. Dickman, at the time of his death, was on the staff of Robert W. Hunt & Co. He was born in Cleveland and was graduated at the University of Michigan in 1886.

Charles E. Lord, general patent attorney for the International Harvester Co., Chicago, died Sept. 25, aged 44 years, as a result of injuries received at the Deering plant Wednesday, when his automobile was struck by a switch engine. He had been head of the Harvester patent department since 1912. He was a member of the American Society of Mechanical Engineers, Society of Automotive Engineers and the American Institute of Electrical Engineers. He had served with the General Electric Co., Schenectady, the Bullock Electric Co., Cincinnati, and the Allis-Chalmers Mfg. Co., Milwaukee.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

EVAN F. JONES, president and general manager of the Clinton-Wright Wire Co., Worcester, Mass., since its incorporation on June 21, has resigned effective Nov. 1 to become general manager of the Elyria Iron & Steel Co., with works at Cleveland and Elyria, O. The election of his successor by the directors is expected to take place Nov. 3, when the stockholders also will meet to decide upon a new name and upon increasing the number of directors. At that time announcement probably will be made of a further consolidation with an eastern steel company, negotiations for which are said to be practically closed. Harry W. Goddard, chairman of the board of directors, will direct the affairs of the wire company until the election of a president.

J. S. Welwood, identified with the Union Natural Gas Co., up until the time he entered military service, recently joined the Pittsburgh sales force of the Lucey Mfg. Co.

C. E. Hutchison, formerly district representative of the La Belle Iron Works, St. Louis, now is associated with the Cleveland office of the Youngstown Sheet & Tube Co., Youngstown, O.

Harry Shaw has resigned as purchasing manager of the Hendee Mfg. Co., Springfield, Mass., to become treasurer and general manager of the Stoy Rubber Corp., Hempstead, L. I.

F. S. Easterly has been appointed to have charge of the office recently opened in Pittsburgh, located in the First National Bank building, by the Hyman-Michaels Co., Chicago, St. Louis and East Chicago, Ind.

Otto Rabe, president of the Kelsy Foundry Co., Chicago, has become affiliated with Christian M. Gottschau and others in the incorporation of the Gottschau Steam Motors Co., 1770 Berteau avenue, Chicago.

George M. Johnstone, stores manager of the Clinton Wire Cloth Co., division of the Clinton-Wright Wire Co., Worcester, Mass., in Clinton, Mass., has been promoted to production manager of the plant.

S. A. Snell has been appointed plant superintendent of the Phoenix Tube Co., which will locate at Warren, O., about Jan. 1. Mr. Snell resigned recently as general manager of the Ohio Steel Products Co., Niles, O.

A. J. Hazlett, who for the past nine years has been in the sales department of the West Penn Steel Co., Brackenridge, Pa., resigned that position recently and on Nov. 1, will assume his new duties as general manager of sales of the Eastern Rolling Mill Co., Baltimore.

Wilmer M. Wood, traffic manager

EVAN F. JONES

of the United States Cast Iron Pipe & Foundry Co., has become associated with the Kerr Steamship Co., New York City, as general freight agent. Mr. Wood had been associated with the United States company for approximately seven years.

Merrill Baker, vice president of the Vanadium Corp. of America, New York City, recently sailed for Peru where he will investigate the company's ore properties there, in connection with its plans for plant and transportation improvements.

V. B. Taylor, for some time connected with the general sales department of the Lyon Metallic Mfg. Co., Aurora, Ill., has been appointed manager of the Pittsburgh district sales office, located in the Oliver building, Pittsburgh. R. J. Nyce has been placed in charge of the company's new branch office at Philadelphia.

H. Z. Kelley has been appointed northeastern Ohio representative of the Keystone Bronze Co. and will establish offices in the Stambaugh building, Youngstown, O. Mr. Kelley resigned April 1 as secretary and assistant manager of the Falcon Bronze Co., Youngstown, having been associated six years with that company.

W. K. Frank, vice president of the Damascus-Bronze Co., Pittsburgh, presented a paper at the bimonthly meeting of the mechanical section of the Engineers Society of Western Pennsylvania held Oct. 14 at the Union Arcade auditorium, Pittsburgh. The subject of the paper was "Notes on Bronze and Babbitt Bearings."

W. W. Leck, who has been general superintendent of the rolling mills at the Steelton plant of the Bethlehem Steel Co., resigned recently to become general superintendent of the American Tube & Stamping Co., Bridgeport, Conn. John Craig, who has been Mr. Leck's assistant, has been promoted to the position previously held by Mr. Leck.

Willis McKee, formerly general superintendent of construction for Arthur G. McKee & Co., Cleveland, contracting engineers, has been appointed general manager of the company's open hearth and steel mill department. Mr. McKee originally was connected with the Duquesne works and Ohio works of the Carnegie Steel Co., leaving their employ to become chief engineer of the Republic Iron & Steel Co. Subsequently he became treasurer and general manager of the Elyria Iron & Steel Co., where he remained until about two years ago, when he became associated with Arthur G. McKee & Co. Rollin Gardner, formerly with the Westinghouse Electric & Mfg. Co. and the Allis-Chalmers Mfg. Co., has been appointed assistant to Willis McKee. H. B. Pearson, formerly project engineer for the W. J. Rainey Co., has been made general superintendent of construction for Arthur G. McKee & Co.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

ALBERT E. NEWTON, vice president and general manager of the Reed-Prentice Co., Worcester, Mass., was re-elected president of the National Machine Tool Builders' association at its eighteenth annual meeting held at the Hotel Astor, New York City, Oct. 16 and 17. Prior to being elected to the presidency of the tool builders' organization in December, 1918, he had served that body as treasurer for over 10 years and for an even longer period had been an active member. Mr. Newton recently refused to be a candidate for the presidency of the National Metal Trades association, since he could not give proper attention to the effort of both organizations. A complete biographical sketch of Mr. Newton's career appeared in the Jan. 9, 1919, issue of THE IRON TRADE REVIEW.

F. J. Mumford has been appointed district sales manager for the Steel Sales Corp., Chicago, with offices in the Book building, Detroit.

C. M. Carmicheal and F. C. Lonney, with offices at 510 Washington Arcade building, Detroit, have been appointed representatives of the Batavia Gun & Forging Co.

E. E. Gates has been elected president of the National Metal Products Co., Indianapolis, which was recently organized, and is an outgrowth of the Indiana Die Casting Co.

H. G. Nash has been made manager of the Huntington, W. Va., district for the Hyatt Roller Bearing Co. with headquarters in the company's new branch office at 1016 Robson-Prichard building, Huntington.

F. W. Munger, production manager of the Detroit Pressed Steel Co., Detroit, has resigned his position to become head of the Materials Service Co., 501 Vinton building, Detroit, which he recently organized.

L. E. Stevens, assistant cost accountant for the Moline Plow Co., Moline, Ill., has been transferred to the company's plant at Poughkeepsie, N. Y., where he will assume his duties as factory accountant.

E. L. Chollman, formerly connected with the Southern Locomotive Valve Gear Co., has become identified with the Paxton-Mitchell Co., Omaha, Neb., as vice president and sales manager. He will have charge of sales in the southeastern territory.

T. W. Holt, who some time ago became assistant general manager of the Curtain Supply Co., Chicago, has been elected a director and secretary of the company to succeed William S. Estell, resigned. Prior to becoming identified with the Curtain company, Mr. Holt was affiliated with the Pressed Steel Car Co.

G. E. Anderson, formerly assistant to the vice president of the American Locomotive Co., has been appointed assistant eastern sales manager of the Duff Mfg. Co., Pittsburgh, with headquarters at its eastern sales offices, 50 Church street, New York City.

Ross E. Willis, formerly general field assistant for the Cleveland district ordnance office, has accepted a position with the Lakewood Engineering Co., Cleveland. His office will be at 1401 David Whitney building, Detroit. Before entering the service of the government, Mr. Willis was connected with the Bethlehem Steel Co.

Lieut. Col. R. L. Streeter, general manager of the Rock Island, Ill., arsenal, has resigned to become assistant mechanical engineer of the Aluminum Co. of America, at New York. Harold B. Dinneen, formerly manager of the John Deere Plow Co., has become assistant to R. H. Lea, production manager of the Moline Plow Co., Moline, Ill.

Jas. S. Hearons has become affiliated with the Gustin-Bacon Mfg. Co., Kansas City, Mo., mill supplies, as railroad representative. Since his return from France in July, where he held commission as captain in the Forty-ninth engineers (railway), Mr. Hearons has been with the Garlock Packing Co., St. Louis, with whom he was connected prior to his entering the service.

Hugh Morrow, prominent attorney of Birmingham, Ala., has been elected vice president of the Sloss-Sheffield Steel & Iron Co., that city, to succeed Landers Sevier. Mr. Morrow has been practicing law for 25 years, being a member of the firm of Tillman, Bradley & Morrow. He is to give all of his time to the new position. Mr. Sevier will not relinquish his connection with the company for the present.

Paul K. Rogers, secretary and treasurer of the Skinner Chuck Co., New Britain, Conn., will leave shortly for a month's trip to Europe to study trade conditions.

George W. Collins, for the past 10 years treasurer and manager of the C. F. Church Mfg. Co., Holyoke, Mass., has sold his interests to Otto Kolstad and J. F. Taylor, both of Springfield, Mass., and has become New York representative of the E. Stebbins Mfg. Co., Springfield, brass goods.

H. Percy Maxim has been elected chairman of the Hartford, Conn., section of the American Society of Mechanical Engineers. The members of the executive committee, in addition to the chairman ex-officio are: Vice chairman, S. F. Jester; secretary and treasurer, W. C. Beekley; R. S. Brown, W. P. Eales, F. E. Howard, C. F. Blake and N. D. Church.

John I. Thompson, chief engineer of the Koppers Co., Pittsburgh, was the speaker at the regular monthly meeting of the Engineers Society of Western Pennsylvania held at the Union Arcade building, Pittsburgh, Tuesday evening, Oct. 21. The subject of Mr. Thompson's paper was "Post-war Conditions in Europe," while also making a comparison of European and American by-product coke oven prices.

Fred A. Cornell, who for the past three years has represented the Timken Roller Bearing Co., Canton, O., in the east, with headquarters at Buffalo, has been transferred to Canton to take charge as manager of the newly organized section of the sales activities of the company, the machinery and industrial appliances division. Judd W. Spray, formerly western representative, has been transferred to Detroit, as central representative with offices at 701-2-3 Book building. Miss Margaret Redmond has charge of management detail of the Detroit office. Richard Creifelds Jr. has been appointed western manager, succeeding Mr. Spray, with headquarters at the Timken offices in the People's Gas building, Chicago.

Tool Makers Review Peace Trade

Builders' Association in Eighteenth Convention Finds First Year of Reconstruction Period Better Than Anticipated—Automotive Industry Contributes Largest Demand for Product—Government Owned Equipment Works no Hardships

MARKING the termination of the initial period of reconstruction the annual convention of the National Machine Tool Builders' association at the Hotel Astor, New York City, Oct. 15 and 16, proved of special interest to over 200 members in attendance. It was obvious from the remarks offered by the various speakers and from the sentiment expressed on virtually every side that the first year following the signing of the armistice, now closing, has proven more favorable than was anticipated about 12 months ago.

It was generally conceded that the year was not up to the standard set by the several similar periods preceding, in fact such was not to be expected. Nevertheless, barring the first four or five months, business throughout the industry has shown a steady gain, and at no time, it was remarked in some quarters, have plants been forced, through lack of business, to undergo any material inactivity.

That this should have developed to be the situation is regarded of special significance in view of the fact that to date little or no railroad demand has materialized and that export buying on the whole has been negligible. A little more than a year ago both of these sources were regarded probably as the most promising. The automotive and allied industries by far have contributed the most to the prosperity of the machine tool industry during the past year. However, this demand has been confined principally to the industries of the character in the Middle West.

It has also developed that the surplus equipment in the possession of the government at the close of the war has not worked a material hardship upon the machine tool industry, or at least no such burden as was expected at the outset. It was developed both at the meeting of the machine tool builders and at the convention of the machinery section of the National Supply and Machinery Dealers' association, held simultaneously at the same hotel, that the equipment yet to be disposed of ranged anywhere in valuation from $25,000,000 to $50,000,000. An accurate setimate is impossible since not all equipment has been listed. Colonel Le Mar, acting for the government, proposed to the dealers that they dispose of the government equipment, the commission offered being 10 per cent. This proposal, it is understood did not meet with the approval of the dealers, who believed that greater compensation was justified.

Varied Topics of Timely Interest Discussed

PRESIDENT NEWTON, in an opening address, stated that the present position of the machine tool industry was one of heavy responsibility. He said that despite the termination of the war, and its attending burdens, this responsibility was as great today as ever before. He alluded in this statement to the labor unrest as well as to the curtailment of production, which is resulting in such a critical situation not only in the United States at this time, but throughout the world. "There is a shortage of skilled and unskilled labor in all industries," Mr. Newton asserted, "and there is no immediate prospect of relief from this handicap." He continued as follows:

"It follows, therefore, that the existing supply of workers must be enabled to produce more than ever before. This can only be accomplished with exertion on the part of the workers, by re-equipping our factories with modern labor saving machinery, better tools and better fixtures.

"If all of the machine shops could be re-equipped with new machines, such as we are able to build today, the increased productive capacity would be well worth while. At present, there are thousands of factories equipped with hundreds of thousands of machines that are obsolete or practically so."

If the managers of even a small portion of these shops were to be impressed with the importance of installing new equipment, the machine tool industry would be confronted with a demand such as has never arisen before, Mr. Newton predicted.

Work of Tool Section Reviewed

C. E. Hildreth, general manager of the Machine Tool Builders' association, who this spring was appointed chief of the machine tool sales section of the war department, reviewed briefly some of the work that had been accomplished in the disposition of government equipment. In the early half of this year, he asserted, the war department had considered the plan of selling the equipment at auction, or rather by sealed bids, and at one time had taken important steps in that direction. In one instance, that of the equipment at the plant of the Union Switch & Signal Co., Swissvale, Pa., the government at one time was considering three such proposals. The machinery comprised about 640 tools, valued at approximately $940,000, and one of the sealed proposals called for the payment of $275,000, or less than one-third of the original valuation. This whole plan, Mr. Hildreth said, was set aside after his arrival in Washington, and in the three months which followed, under the fixed price plan, 205 of the machine tools, or approximately one-third of the original number, were sold for $278,000, a higher total than was offered under the former plan for the entire lot.

This plan, Mr. Hildreth pointed out, not only worked to the great advantage of the government, but also redounded to the benefit of the machine tool industry, for, he explained, the tools were in excellent condition and when the manufacturers were buying right, the industry profited. There were and continue to be instances where auctions are being held, Mr. Hildreth said but, practically without exception, only where the equipment involved is in poor condition. Of the new standard machines, virtually all are being retained by the government, being alloted to the arsenals, etc.

That unintelligent competition is the

worst thing machine tool builders have to face, is the opinion of William R. Basset, of Miller, Franklin & Basset Co., New York City, who addressed the association on "Uniform Cost Accounting." "This," Mr. Basset asserted, "virtually can be remedied by close attention to costs. With prices as erratic as they are today manufacturers cannot afford to leave anything to chance."

"In the old days," Mr. Basset said, "it was a fairly safe procedure to ascertain a cost, once or twice a year, and within certain limitations, to stick to that cost. Today, you have widely varying costs; labor conditions change from day to day, and your overhead necessarily varies. We have this year encountered fluctuations in overhead of from 150 to 225 per cent, the fluctuations occurring monthly for six consecutive months.

"You must have a sort of a clinical thermometer tucked away in the corner of your business mouth, that is going to tell you at least monthly what the variations in your costs are, so that you can go out and you can compete intelligently."

In the course of his remarks, Mr. Basset stated that federal taxes cannot be included in the costs. This, he said, was because the taxes are not determined until the last moment; however, it is possible to estimate fairly closely into what taxpaying class one may land. It is vitally necessary, he pointed out, that this be done, that the manufacturer knows what the taxes will be within certain limits, in order that the spot cash, which the government demands, will be available.

"I may say," Mr. Basset added, "to those who have not studied the 1919 taxes, that they differ rather materially from 1918. In 1918, it was necessary for some companies who made prodigious profits, to be obliged to pay 83 cents out of every dollar, over and above a certain per cent, to the government. This year, after you have attained a certain percentage of profit, you may be forced to pay 46 cents out of every dollar to the government, plus a possible state tax."

In one of the most stirring addresses ever delivered before the association, Bainbridge Colby, a lawyer of New York City, and formerly of the United States shipping board, asserted that the way to mastery of international trade is by a broadening study of the conditions that limit international trade and make either for success or failure in that field.

Mr. Colby also availed himself of the opportunity to appeal to manufacturers to organize to stamp out the I. W. W. menace, which he regarded as most serious. He stated that action was imperative. "Do not," he admonished, "spend overmuch time in deliberation; only to the point where you appreciate clearly the thing to do, and then advance to act, because it is in the verb, not the adjective; energy, not reflection; progress, not deliberation, that the solution of the ills of the hour lies."

Under the title of "International Finance," an address of the utmost interest was submitted by George B. Mallon, of the Bankers' Trust Co., New York City. At present, he asserted, there is a widespread realization of the necessity for a broad, generous market for foreign securities in this country to facilitate American export trade. These securities must not only be safe, but attractive. Commenting further, Mr. Mallon said:

"There seems to be a demand at present for a type of corporation that can make it its business to finance any kind of export business so that the American producer and the European consumer may sell and buy at once. It has been suggested, as the outcome of the investigations, that such a corporation, or perhaps several such corporations, be formed. It would probably send good credit men abroad and it would proceed to get the capital necessary for financing. It would, of course, be a stock company, and in effect it would be a banking corporation doing a foreign exchange business on long-time credits.

"For example, a purchaser of machinery in Belgium ordering tools in this country, on long-time credit, could obtain it through such a corporation. This credit would be examined and his bank would vouch for him. In some cases a group of banks might stand back of such a credit of perhaps a foreign government. The corporation financing this transaction would have back of it the individual purchaser, his bank, or banks, or government, and against these long-time credits it would issue debentures which would have in addition the guarantee of the corporation issuing them. These would have to be issued at a rate to make them attractive to the investing public. Some such plan is being considered, and, although it has not been perfected in its details, it now seems probable that something of this kind will be devised for the immediate financing of our export business."

In his address on "International Finance," George B. Mallon, of the Bankers' Trust Co., New York, stated that he believed the solution of the foreign trade problem lies in the final passage of the Edge bill, which still is pending in congress. He said:

"Our government is wisely disinclined to lend more money abroad, except in cases where it is absolutely necessary. Nor would it be sound finance to tie up our banking resources in long-time foreign credits. However, long-time credits must be extended to Europe, and from what I know of the plans under consideration, I think the problem will be solved as quickly as possible after the passage of the Edge bill.

"Under the Edge bill corporations may be formed with a capitalization of not less than $2,000,000 to undertake this kind of financing and serious consideration is now being given to how such corporations should be formed and what they might accomplish. It is conceivable, of course, that such a corporation might be formed in the machine tool industry, another in the steel industry, and others in other industries that export. Possibly that may develop later."

Of considerable interest to the association were the remarks of Alexander Luchars, president of The Industrial Press, publisher of *Machinery,* New York City, who this year made an exhaustive study of conditions in Europe from the standpoint of the machine tool builder, spending several weeks on the other side. His report covered the situation in seven countries. Mr. Luchars impressions and conclusions, which are contained in his report to the department of commerce and in an article on the German situation, published by himself, will appear in early numbers of THE IRON TRADE REVIEW.

The first day of the convention was given over to general sessions. The second, and last day, was devoted to committee meetings in the morning and an executive session in the afternoon. During this latter session the announcement was made that all officers had been re-elected for the ensuing year.

These officers follow: President, Albert E. Newton, vice president and general manager of the Reed-Prentice Co., Worcester, Mass.; first vice president, A. H. Tuechter, president of the Cincinnati-Bickford Tool Co., Cincinnati; second vice president, E. J. Kearney, secretary and treasurer of the Kearney & Trecker Co., Milwaukee; treasurer, Winslow Blanchard, president of the Blanchard Machine Co., Cambridge, Mass.; and secretary, Charles E. Hildreth, president of the Whitcomb-Blaisdell Machine Tool Co., Worcester, Mass. The spring meeting of the association will be in Atlantic City.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

AN ADDITION to the shop of the Newton Machine Tool Works, Inc., Philadelphia, is under construction. The new shop will cover a ground space, 230 x 400 feet, and will comprise 92,000 square feet of floor space. It will include an erection shop, a pattern and a storage shop, forge shop and power plant. The erection shop is to have one square foot of overhead light for every square foot of floor space and is to be used for the erection of machinery on a quantity basis. It is to be fitted with two 50-foot span overhead traveling cranes.

* * *

THE Lewis Foundry & Machine Co., Pittsburgh, reecntly started its new 30-ton open hearth acid furnace and now is making steel and alloy rolls as well as a more extensive line of steel castings than it previously made.

* * *

GROSS business of the Atlas Drop Forge Co., Lansing, Mich., during the last 12 months was $1,000,000. The company, according to S. H. Carpenter, general manager, will spend $100,000 for new equipment before the first of January.

* * *

CONSTRUCTION work on the $1,500,000 additions to the plant of the Scullin Steel Co., at St. Louis, is nearing completion. The additions include rolling mills for merchant bars, reinforcing rods and other small structural shapes. The main drive will be by electricity.

* * *

UNDER the name of the Ferdinand G. Schultz Co., Ferdinand G. Schultz, who recently resigned as Pittsburgh district sales manager for Shimer & Co., Philadelphia, has opened offices in the Jenkins Arcade, Pittsburgh, for the handling of pig iron, fuel, alloys, ore and sand.

* * *

WORK has been begun on the new plant of the Foot-Burt Machine Co., Cleveland, and the company expects to be under its new roof by Jan. 1. The new plant will give the company 127,000 square feet of floor space. It will be used for making drilling machines and special machinery.

* * *

JOSEPH T. RYERSON & CO., Chicago, have bought a block at Fifteenth and Rockwell streets and Ogden avenue, adjoining the two blocks in Rockwell street already occupied by their warehouses. The property was owned by the Crane Co. and is occupied by a brick foundry building which will be adapted to warehouse use. No program for immediate improvement has been made.

* * *

IN order to develop the production of 4-drive tractors, the Traction Engine Co., Boyne City, Mich., recently increased its capital stock from $75,000 to $150,000. Enlargement of its plant and the erection of additional storage buildings has been completed, as well as the remodeling of the Conrad Iron Works foundry. Additional machinery and equipment has been installed. No new machinery will be added before mid-winter or early spring. E. M. Ackerman is secretary of the company.

* * *

A TRANSACTION recently was completed whereby the Clarendon Refining Co., Warren, Pa., will enter a new corporation recently formed known as the White Oil Corp. This new corporation also has taken over the holdings of P. J. and Thomas White and the Crown Refining Co., of Houston, Tex. The refinery of the Clarendon Refining Co. has a daily capacity of 1000 barrels and it also controls pipe lines, tank cars and a number of leases.

* * *

A. I. LAING recently resigned as president and treasurer of the American Iron Products Co., 107 Liberty street, New York, and in the reorganization the following officers were elected: President, Charles H. Williams; vice president, E. Douglas O'Neill; secretary and treasurer, Proctor M. Denno. The board of directors includes Messrs. Williams, O'Neill and Denno, Herman Pregger and John F. McClure. All the officers and directors are old employes of the organization. The company has comprehensive plans for the further expansion of its business in foreign countries. It is adding several new departments.

* * *

THE Worcester-Crompton Loom Co., and the Randolph Crompton experimental department, both of Worcester, Mass., have been taken over by the Mason Machine Works, Taunton, Mass., with whom Randolph Crompton, the owner, goes as supervisor of the automatic loom department. The Worcester business has been devoted on a small scale to making automatic cotton loom attachments. They now will be made on a larger scale by the Taunton company.

* * *

ORGANIZED to manufacture, sell and distribute collapsible metal shipping cases, the Hazen Metal Collapsible Shipping Case Co., 408 East Seventh street, Long Beach, Cal., has purchased a site for its first factory building. Equipment which has been ordered, will be installed about Feb. 1, and the production of one metal case each seven seconds is contemplated shortly after that date. The cases will be made of black and galvanized steel sheets which to prevent rusting will be given a patented metal dip to give them a finish resembling porcelain.

* * *

QUANTITY production has been attained by the Great Lakes Malleable Co., Milwaukee, in its new plant on Reed street. The unloading of the first annealing oven to be packed was begun Oct. 2. So much business has been booked that practically all of the casting capacity is required and the addition of a third annealing furnace probably will be made within a short time. The main shop originally was that of the Maynard Steel Foundry Co., which as the Maynard Electric Steel Foundry Co. is operating in a new plant in Layton Park, Milwaukee. The Maynard shop was completely rebuilt for malleable work and two-furnace annealing building constructed during the summer months. Matthew Hoff, formerly of Montclair, N. J., is treasurer and works manager, W. T. Hercher, formerly of the Chain Belt Co. malleable department, is superintendent.

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

SCHEDULED for completion in about 45 days, at Towson Heights, Md., the new plant of the Black & Decker Mfg. Co., maker of portable electric tools, will be 100 x 200 feet. It will adjoin the company's present plant on the west side and will be connected directly with it. The new building will add 20,000 square feet of manufacturing floor space to the present space of 12,000 square feet. This 32,000 square feet does not include store house, chemical laboratory or the new office building, to which the company's headquarters recently were removed from Baltimore. Sufficient machine tool equipment will be installed to double the company's output of portable tools, air compressors, etc. The Austin Co., Cleveland, has the contract for this building which will be of combined steel frame, glass and brick construction, finished in stucco. A modern steamheating system for the entire plant will be provided. Plans include women's rest rooms, maple flooring over groove pine underflooring over concrete. It is expected that the new factory unit will be completed by Dec. 1 and that operations will commence shortly after the first of next year. The Black & Decker company owns 125 acres of land in Towson Heights.

* * *

FREYN, BRASSERT & CO., Chicago, engineers, have been retained by the Shelton Iron, Steel & Coal Co., Stoke-on-Trent, England, as consulting engineers in connection with blast furnace and rolling mill improvements.

* * *

ADDITIONAL land near its present plant, has been purchased by the Chattanooga Coal & Iron Co., Chattanooga, Tenn. It is to be used for additions as the business of the blast furnace expands. A total of $22,900 was paid for the property.

* * *

GROUND will be broken immediately at Warren, O., for the new plant of the Phoenix Tube Co. The company now is located at Brooklyn, N. Y., but will move its plant to Warren, O., about Jan. 1 when the new buildings are expected to be completed. The Phoenix company manufactures steel tubing for automobiles, bicycles and beds. S. A. Snell, formerly associated with the Ohio Steel Products Co., Niles, O., has been appointed superintendent of the new plant.

* * *

AT A recent meeting of the United States Cement Tile Co., the following officers were elected: President, B. E. Thompson, Beaver, Pa., who is connected with the Rochester Clay Products Co.; vice president, H. N. Trimble, of the H. N. Trimble Steel Co., Pittsburgh; secretary, G. R. Mueller, Beaver, Pa.; treasurer, C. L. Kirk, Pittsburgh; superintendent, W. A. Ault, New Castle, Pa. The general offices of this company, formerly located at New Castle, have been moved to Pittsburgh, now being located at 2223 Farmers bank building. This company manufactures a steel reinforced cement roofing tile.

* * *

NEW officers and directors of the Moline Plow Co., Moline, Ill., chosen at the annual meeting, bring the official retirement of Frank Gates Allen, founder of the business. He is succeeded by George N. Peek. Officers are: Chairman of the board, John N. Willys; president and general manager, George N. Peek; vice presidents, H. S. Lord, J. L. Irving, R. W. Lea and O. H. Seiffert; secretary, L. C. Blanding, assistant secretary, T. J. Marshall; treasurer, H. S. Lord; first assistant treasurer, C. B. Odell. Directors are John N. Willys, George N. Peek, C. A. Earl, J. L. Irving, R. W. Lea, O. H. Seiffert, G. E. Huntoon, H. S. Johnson and L. C. Blanding.

* * *

THE Minerva Engine Co., Sixty-first street and Curtis avenue N. E., Cleveland, manufacturer of motor truck and tractor engines, has purchased an 8-acre site in that city, for purposes of expansion. Plans now are being prepared for a large engine factory which is to be erected immediately. Contract for the first unit comprising at least 30,000 square feet, is to be let immediately and the structure is to cost in excess of $100,000. This first unit is to be used for assembling and final testing of engines and will provide a large machine shop. The construction of a gray iron foundry also is contemplated. C. S. Goby is president; R. A. Johnson, vice president, and D. R. Long, secretary.

* * *

AS A development of its logging, sawmill and heavy duty machinery plant, the Sumner Iron Works, Everett, Wash., is establishing a tractor department. This is being done to provide against the decline of lumbering in the Pacific Northwest and to take advantage of the large highway construction program projected in that territory. A complete plant manufacturing road graders, drags, plows, trailers, etc., has been acquired and the equipment moved from Minnesota to Washington. The tractor department will manufacture on a royalty basis the four-wheel-drive tractor design now in production at the Topp-Stewart Tractor Co. plant in Clintonville, Wis. General Manager F. L. Powell of the Sumner works has been spending several weeks at the Clintonville works to familiarize himself with methods of manufacture and other details.

* * *

RECENTLY incorporated at $500,000 the Detroit-Star Grinding Wheel Co., Detroit, takes over the properties of the Star Corundum Wheel Co. and the Detroit Grinding Wheel Co. The equipment and property of the latter company eventually will be brought over to the site of the Star company at 241-261 Cavalry avenue, where the offices and factory of the new plant will be located. The organizers are: President, John R. Kempt; vice president, J. T. Wing; secretary and treasurer, Frank H. Wheldem. Mr. Kempt formerly owned and operated the Star Corundum Wheel Co., from its organization, May 1, 1907, Mr. Whelden has owned and operated the Detroit Grinding Wheel Co., for several years past, having succeeded the late Gilbert Hart, founder and organizer of that business. Mr. Wing has conducted the factory and mill supply house of J. T. Wing & Co., Detroit and Windsor, Ont., for the past 30 years. Edward W. Dodge is general sales manager.

Labor Blocking Own Interests

Would Have Shared in Rising Prosperity Had it Not Been Led Astray by Agitators—Republic Earnings Shows Fine Increase—Will Suffer if Industry is Bled Dry—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

THE great economic error committed by the radical leaders responsible for the attempted steel strike was once more impressively emphasized by the report of the Republic Iron & Steel Co., for the third quarter of the current year. Coming on the heels of the earnings showing of the Lackawanna Steel Co., which exhibited a fine recovery from the deficit of the previous three months, the Republic report provides accumulating evidence of the vigorous progress toward a high level of prosperity being made by the steel industry when the ill-advised walkout of the minority was called, Sept. 22, by the radical leaders.

In this prosperity exemplified by an increase in net profits for Republic of 148 per cent over the June quarter, labor undoubtedly would have shared. The steel industry has ever been the first to give its labor the benefit of increased earnings. This is vividly shown by the record of wage increases during the war period, when augmented business and rising prices resulted in higher profits. Wage increases followed each other in rapid succession during this period with the result that the remuneration of the workmen jumped from 100 to 150 per cent, greatly exceeding the rise in the cost of living with a 70 to 80 per cent increase.

War wages were at the highest peak ever known. Yet when the armistice was signed and industry slackened these wages were not disturbed. The policy of the industry was fixed on maintaining wages until the decline in the cost of living justified readjustments. Prices of steel products dropped, operations slumped, earnings tumbled from the imposing war-heights to levels humble indeed by comparison, but through it all wages were undisturbed. The companies carried the men cheerfully through the lean period back to the present of actual or closely-approaching prosperity.

The steel strike has an economic significance that makes it of especial interest to general business of the country. Although the nation has been disturbed by a daily average of more than 300 strikes for some months, trade has not felt any depression as a result. At present there are 65 unauthorized strikes in existence. The tendency of strikes is to reduce production and increase prices, but since the laborers have been winning in most cases, they have been compensated for their "vacations" and no decrease in the buying power has appeared. The steel strike, however, is the first conspicuous example where the men are meeting resistance and face the certain prospect of returning to work under the old conditions, with nothing but a loss of income for their pains. In fact the purpose of the strike was not for higher wages but union recognition. By this means the purchasing power of the workers involved will be diminished and goods should be in less demand. If other industries are compelled to cease operations from lack of material, or through resisted strikes, the buying power of the masses promises to fall off tremendously.

Present prices are being held upon an elevated plane in large measure by the buying stimulated by high wages. Cut off these wages from a considerable number of workmen and the demand for comforts, and luxuries and even necessities is bound to recede, with an inevitable effect upon trade and prices. Of course decreased production would mean lessened supplies and higher prices, if the purchasing power of the people remained constant.

Voluntarily reduced consumption and increased production is the only fundamental way in which the present difficulties caused largely by a world shortage of goods may be solved and prices may adjust themselves to a more reasonable basis. Wilful and unjustified strikes will bring reduced con umption enforced by lack of income. The radicals, however, with promises of things impossible of human attainment, have been able to convince a considerable element of labor that all the joys and comforts of life are to be had through the medium of some magic spell—and not through hard, diligent toil.

Labor has two alternatives in bringing down prices—it may increase production through efficient work, or it may drastically curtail the buying power of the country through "vacationing." In the one case it could enjoy good wages and have the comforts of life, while in the other it will bring only suffering and if persisted in far enough, industrial disaster.

With an era of great prosperity based on world wide need of goods at hand, it would be a sorrowful thing indeed if American labor were so blind as to persevere in its "grab-game" until it has bled industry dry and finds itself in the end hugging the empty shadow of disillusionment. In its mad rush to get "while the getting is good" labor is heading toward this very goal. If that ever is reached, labor will go hungry but it will be wiser.

British Iron and Steel Works Prosper

(Special Correspondence)

SEVERAL reports of British iron and steel companies recently issued show a continuance of prosperity and in many instances a marked expansion. Generally, it may be stated, the compannies had a very good year and have no reason to complain of the results they obtained.

Messrs. Pearson & Knowles, Ltd., for the year ended June 30, after allowing for excess profits, had a net balance of £248,141. A final dividend of 6½ per cent on the ordinary shares made the total 10 per cent, less tax, for the year, together with a bonus of 1s per share, free of tax. The sum of £50,000 was placed to reserve and £101,599 carried forward. This makes a dividend for the year of 15 per cent, compared with 45 per cent the previous year and 7½ per cent for 1914

and 1915.

The Staveley Coal & Iron Co. shows a net profit after providing for depreciation, of £279,168. Interim dividends having been paid, further payments are authorized, making 10 per cent for the year. A balance of £66,830 is carried forward. In addition, the company has been able to pay off the whole debenture issues.

The Sheffield Forge & Rolling Mills Co., Ltd., shows a net profit of £41,302. After applying £8000 for special renewals and extensions and making a general reserve of £15,000 a dividend of 10 per cent free of tax was paid. The balance of £3302 remained.

Messrs. Bolckow, Vaughan & Co., Ltd., Middlesborough, although not able to issue a full balance, had a profit available for distribution including an amount brought forward from last year, of £733,617. The expenditure during the year upon blast furnaces, steel furnaces, rolling mills and electrical installations was £574,753. A dividend of 12 per cent for the year was paid.

Messrs. John Brown & Co. report that operations at the Atlas Works have suffered materially from the want of orders for armor plate, while the result of the working of the collieries has been very unsatisfactory. The receipts from other branches and allied companies, however, have been well maintained. To strengthen the position of the company a considerable interest has been purchased in the Carnforth Hematite Iron Co., Ltd., and in Cravens' Railway Carriage & Wagon Co., Ltd. Large interests have been acquired in the Coventry Ordnance Works and the English Electric Co., Ltd. The latter comprises Dick Kerr & Co., Ltd., the Phoenix Dynamo Co., Ltd., Willams & Robinson, and other companies engaged in electrical production. The net profit for the year was £467,171, making the total surplus £631,565. The dividend for the year was 12½ per cent less tax. The position of John Brown & Co., Ltd., is fairly representative of the great independent armament firms who find it necessary to reshape their industrial course. This is the fifth year that the Brown company has been able to pay 12 per cent dividend on its ordinary shares, less tax. The value of freehold land, works, collieries, etc., is put at £5,901,425 or £370,320 more than shown in the previous balance sheet.

John Lysaght, Ltd., which figured recently in a large amalgamation with collieries in South Wales, reports a profit of £481,151. After providing for interest on debenture stock and dividends on 6 per cent preferred shares a balance of £965,482 remains from which it is proposed to pay a bonus of 4s per share, free of income tax, on the ordinary shares in addition to an interim dividend of 10 per cent free of income tax, which has already been distributed.

Republic's Profits Jump in Third Quarter

With a gain of 148 per cent over the previous quarter the net earnings of the Republic Iron & Steel Co. for the three months ended Sept. 30 provide evidence of the strong recovery registered by the steel industry during the last few months. The $1,271,147 available for dividends shown in the company's report established the high record for the current year and compares with the $510,916 of the previous quarter and the $1,053,956 of the first three months.

An especially significant feature of the report is the item of unfilled orders which on Sept. 30 stood at 433,495 tons of finished and semi-finished products. This is the highest figure for any previous quarter during either 1919 or of last year. It represents a gain of 131 per cent over the 187,361 tons as of June 30. On March 31, the unfilled orders were 114,305 tons and on Sept. 30 of 1918 they were 315,164 tons.

The company does not give the amount reserved for estimated taxes out of the quarter's earnings. The reduction in the charges for depreciation and renewal of plants of from $535,271 in the third quarter of 1918 to $337,747 in the quarter just closed is a reflection of the passage from the war to the peace period.

The nine months earnings were $2,836,019 as against $8,134,859 for the corresponding period of 1918. The report shows the charges for maintenance and repairs during the quarter were $1,287,908 as compared with $1,382,806. The accompanying table shows the comparative earnings reports of the company for the three quarters of 1919 and the third quarter of 1918.

	Third quarter 1919	Second quarter 1919	First quarter 1919	Third quarter 1918
Net earnings	$1,740,406	$952,770	$1,572,475	$2,829,555
Interest and income	135,478	169,816	200,971	82,648
Depreciation and mineral exhaustion	422,474	433,245	541,065	625,940
Interest on bonds	182,263	178,425	178,425	178,942
Net available for dividends	1,271,147	510,916	1,053,956	2,107,317
Preferred dividend	437,500	437,500	437,500	437,500
Common dividend	407,865	407,865	407,865	407,865
Surplus for quarter	425,782	*334,448	208,591	1,261,952
Unfilled orders, tons	433,495	187,361	114,305	315,164

*Deficit.

Pittsburgh Steel Working Capital is High

The annual report of the Pittsburgh Steel Co., shows that during the year ended June 30 net profits of $2,771,546 were earned as against $4,556,442 for the preceding year. The company had net sales aggregating $31,265,012 as compared with $37,930,842 last year. The decrease in sales and profits for 1919 are attributed to the reduced operations which followed the signing of the armistice and continued through the first six months of the current year.

The company's financial position is sound with current assets of $15,547,640 and net working capital of $12,646,261. The property account, according to the balance sheet, is shown to be $25,532,957 against $21,911,949 in 1918. During the year $1,275,433 was charged off for depreciation of plants and extinguishment of mines, and $244,015 for estimated war taxes. Last year taxes were $2,730,121. The comparative income account follows:

	1919	1918
Total sales	$31,265,012	$37,930,842
Mfg. costs, etc	27,240,756	29,409,724
Selling expenses, etc	1,069,482	1,324,086
Net operating profit	2,954,773	7,286,564
Miscellaneous income	60,824	89,534
Profits tax	244,051	2,730,121
Net profits	2,771,546	4,556,442
Preferred dividend	735,000	735,000
Common dividend	910,000	1,960,000
Surplus	1,126,546	1,861,442

The report tells of the purchase of the Alicia Coal & Coke properties consisting of 660 acres of coal land and 400 rectangular coke ovens located at Alicia, Fayette county, Pa. The price paid was $3,750,000, of which $1,000,000 was paid in cash on delivery of the deeds. The balance is payable in installments over a period of five years with interest at the rate of 5 per cent on deferred payments.

The company reports that it has purchased a tract of land at Monessen on which it proposes to build immediately 25 houses for employes. The average number of employes during the year was 5612 and the salaries and wages totaled $9,575,815 making an average annual wage per man of $1706. Wages have been maintained at the war levels throughout the year the report states.

Tool Sellers Continue Sanguine

Occasional Falling off Noted in Demand for Machine Tools and Equipment—In Middle West Sellers are Busy Day and Night—Crane Market Active—Chillicothe, O., Project to Require 35 Cranes

CONFIDENT expressions continue to be made by machine tool sellers regarding the present and prospective market. Many believe that unless something unforeseen occurs, the high rate of activity which now obtains, will continue for another six months at least. Others are not so optimistic. Interest in the East centered during the past week in the meeting of the National Machine Tool Builders' association, a report of which is published elsewhere in this issue. An improving sentiment is noted in the eastern territory and there as well as in other districts, the belief is held that after the labor situation becomes more stabilized, more machine tool sales will be consummated. In Pittsburgh, Cleveland, Detroit and in Chicago as well an occasional order is held up and the iron and steel strike is given as an excuse.

Inquiries and orders for small lots of tools continue to crowd the mails of tool sellers in Cleveland and Chicago. The Templar Motors Corp., in the former city, is said to be preparing a list of $300,000 worth of equipment. Some of the railroads are putting out tentative inquiries for machines as their purchasing agents endeavor to line up 1920 budgets. The Stevens Motor branch of the Moline Plow Co., Freeport, Ill., bought about $6000 worth of miscellaneous tools.

Of interest to the general machine tool trade is the announcement from Washington, that the war department has sold to La Construction Metallique, comprised of 500 companies in Belgium, about 2500 government-owned tools. Credit arrangements in this country for Belgium have been made to the extent of $50,000,000 and the Belgian government has authorized that 25,000,000 francs of this be spent for machine tool equipment now held by the ordnance, air service, purchase and storage service departments of the United States government.

Heavy equipment is moving freely from Pittsburgh. One company has specifications out for 17 cranes and the Carnegie Steel Co., Pittsburgh, wants four for its Upper Union mills. The Firestone Steel Products Co., Akron, O., asks for seven and the American Steel & Wire Co., Cleveland; the Rogers-Brown Iron Co., Buffalo; American Steel Co., Pittsburgh; Miner-Morse Corp., Erie; Heppenstall Forge & Knife Co., Pittsburgh; Pittsburgh Knife & Forge Co., Coraopolis, Pa., want one crane each. Sales of two cranes each were made recently to the American Locomotive Co., Schenectady, N. Y.; Sharon Steel Hoop Co., Sharon, Pa.; Youngstown Pressed Steel Co., and the Petroleum Iron Works, Sharon, Pa., the Weirton Steel Co., Weirton, W. Va. and the Ellwood City Forge Co., Ellwood City, Pa., bought one each. The Follansbee Bros. Co., Pittsburgh, is expected to issue specifications shortly for requirements at Toronto, O. The Newton Machine Tool Works, Inc., will require two cranes at Philadelphia. The Acme Road Machinery Co., Frankfort, N. Y., is inquiring for one crane in New York City. The second lot of cranes closed recently, has been sold to the McIntosch & Seymour, Auburn, N. Y. Considerable conveying equipment for the proposed terminal on Staten Island, N. Y., is expected to be closed soon by the Pan American Terminal & Dock Co., New York City. A steel and steel car plant project at Chillicothe, O., which will call for the expenditure of approximately $50,000,000,is of interest to crane builders in and around Cleveland, since 35 cranes will be required. W. H. Monahan Jr., Columbus, O., is the engineer in charge.

Sentiment Improves in Eastern Tool Market

ALTHOUGH few large lists were issued during the past week, demand in the eastern machine tool market is increasing and much better sentiment is in evidence. In addition to several sizable inquiries pending, the largest of which is that of the New Departure Mfg. Co., Bristol, Conn., actual buying of increasing proportions is being done. This activity for the most part is being comprised of small scattered orders.

Demand for cranes for the past couple of weeks has been somewhat quiet. This inactivity has been especially noticeable within the past few days. The Acme Road Machinery Co., Frankfort, N. Y., is inquiring for a 20-ton overhead crane, with 37-foot span. Westinghouse, Church, Kerr & Co., New York City, have purchased a 40-ton locomotive crane from the Industrial Works. Stone & Webster, Boston, are understood to have closed on a 15-ton locomotive crane. McIntosch & Seymour, Auburn, N. Y., have placed two 5-ton wall cranes with the Northern Engineering Works. This contract was reported to have been placed with another builder, and constitutes the second lot of cranes to be awarded the Northern works recently by McIntosch & Seymour. The Pan American Terminal & Dock Co., 255 Broadway, New York City, is in the market for considerable conveying equipment for a proposed terminal on Staten Island.

Belgium Takes Many Machine Tools

ANNOUNCEMENT has been made by the director of sales, Washington, that the war department has entered into a contract with La Construction Metallique, a co-operative society composed of the heads of approximately 500 industrial organizations of Belgium, for the

sale of a quantity of surplus machine tools held by the department.

The Belgian government has arranged, through an American banking interest, for a credit of $50,000,000 in the United States, and La Construction Metallique has been authorized by the Belgian government to make purchases of machine tools against this credit to the extent of 25,000,000 francs. To date, La Construction Metallique has purchased from the war department approximately 2500 machine tools.

The contract with La Construction Metallique was made by C. W. Hare, director of sales, during his recent visit to Europe. La Construction Metallique recently sent to the United States a commission headed by Lieutenant Jean Jean, the director general of the co-operative society, to make a general survey of mechanical equipment which the bureaus of the war department hold as surplus.

The machine tools sold to La Construction Metallique are now being selected from the several districts of the ordnance department, the air service and the purchase and storage service, and are being put in transit to Belgium as rapidly as they can be prepared for shipment.

Some Holding Back Noted in Chicago

WHILE most dealers in the Chicago district find demand for machine tools is holding up to the high mark which has prevailed for several months, an occasional house notes a falling off. Business continues to be made up principally of small purchases, while large inquiries are practically absent. There is, however, considerable selling in lots which involve $6000 to $10,000, although at present prices of tools, this does not mean many separate machines. One dealer recently closed two lots at $8000 each which could be furnished direct from his salesroom. The Stevens Motor branch of the Moline Plow Co., at Freeport, Ill., recently closed for about $6000 worth of equipment including drills, milling machines and sheet metal working equipment. Dealers find it is difficult to buy tools in the possession of the government, as business methods are so foreign to the traditions of the trade that it is almost impossible to put through a deal in a way to give a profit. It develops now that the Moline Plow Co. will not be able to equip its rebuilt machine shop from government sources to the extent that had been thought. Considerable equipment which this company had thought it had contracted for was found later to have been allotted to government arsenals and to Belgian buyers. The Fitzsimons Steel & Iron Co., Chicago, manufacturer of cold drawn steel, has bought a site in Chicago on which it will build a manufacturing plant and warehouse. The Rudy Furnace Co., Dowagiac, Mich., is building an additional manufacturing building and a storage building. The Keller Brass Works, Grand Rapids, Mich., is building an addition. The Anderson Foundry & Machine Works, Anderson, Ind., is building a new plant.

Crane Orders Numerous in Pittsburgh

CONSIDERABLE activity marks the trade in cranes, both actual and prospective. The Champion Engineering Co., Kenton, O., has taken through its Pittsburgh office, a 15-ton crane for the Weirton Steel Co., Weirton, W. Va., a 15-ton crane for the Ellwood City Forge Co., Ellwood City, Pa. and two 50-ton cranes for the Schenectady, N. Y. works of the American Locomotive Co., The Sharon Steel Hoop Co., Sharon, Pa., has closed for two 15-ton cranes, with the Cleveland Crane & Engineering Co., Wickliffe, O. The Youngstown Pressed Steel Co., has closed with the Shaw Crane Works, Muskegon, Mich., for two cranes for its new plant at Warren, O., while the Petroleum Iron Works, Sharon, Pa., also has placed an order for two Shaw cranes.

In the way of prospective business it can be stated that specifications have gone out from one company for 17 cranes, while the Carnegie Steel Co., is in the market for four cranes for its Upper Union mills, Pittsburgh; the American Steel & Wire Co. is looking for a crane for its Newburgh works, Cleveland; the Firestone Steel Products Co., Akron, O., is in the market for seven 5-ton cranes; the Rogers, Brown Iron Co., Buffalo, is seeking a 10-ton crane; the American Steel Co., Pittsburgh, wants a 5-ton crane for its Ellwood City, Pa. plant; the Miner-Morse Corp., Erie, Pa., have put out an inquiry for a 15-ton traveling hoist; the Jessop Steel Co., Washington, Pa., is asking bids on two 10-ton cranes; the Heppenstall Forge & Knife Co., Pittsburgh, wants a 5-ton crane and the Pittsburgh Knife & Forge Co., which is erecting a new plant at Corapolis, Pa. is in the market for a crane, in addition to seven steam drop hammers and a full line of forge plant equipment. The Follansbee Bros. Co., which is about to start work on its new plant at Toronto, O., is expected to close shortly for some of the equipment.

Inquiries for heavy equipment exceed actual orders, but this is explained by conservatism created by the unsettled labor situation. Machine tools also are moving with less snap this month than they did in September, because of the labor situation.

High Rate of Inquiry is Maintained

TERRITORIES supplied by Cleveland and Detroit machine tool dealers, continue to contribute many inquiries and a large number of orders. These mostly are for small lots of from one to four machine tools and while considerable closing appears still to be held up because of the iron and steel strike, the buying represents a sizable total. Demands by the automotive and allied industries continue to be large and with the expansive market for cars coupled with the fact that automobile manufacturers are going in more and more for production, it is thought that this market for equipment is assured for several months to come.

In Detroit equipment sellers are working day and night trying to get out from under the load. The Olds Motor Works, Lansing, Mich., has been an active buyer as have practically all of the Michigan automobile manufacturers. The General Motors Corp., is equipping a truck manufacturing plant at Pontiac, Mich., and both the Paige-Detroit Motor Car Co., and the Cadillac Motor Car Co., are building large plants in West Detroit, the latter upon a 7-acre site. Inquiries for machine tools from the Cadillac company as well as orders reach Cleveland as well as Detroit. The Detroit Seamless Steel Tubes Co., likewise is building a large plant in West Detroit which soon will be ready for equipment installation. The Alamo Farm Light Co., Hillsdale, Mich., is building a new plant, 200 x 350 feet, and is in the market for new machine tool equipment, power transmission apparatus and electric motors. A fair sized machine shop is being erected at 436 Lawton avenue, Detroit, by the Edmund & Jones Corp. The Detroit Automatic Scale Co., Detroit, is in the market for a woodworking machine and two precision lathes. A few tools will be purchased by the Cogsdill Mfg. Co., West Warren avenue, Detroit, for a small automobile accessory plant. The Lutes Sinclair Co., Benton Harbor, Mich., wants a 24-inch turret lathe. Sales made in Cleveland during the past few days include a shaper and a vertical milling machine to the Cleveland Copper & Brass Co., Cleveland. The American Car & Foundry Co., New York, bought a twin spindle ball bearing polishing lathe for Chicago. The Garford Mfg. Co., Elyria, O., the Machine Products Co., and the Brown Hoisting Machin-

Say you saw it in THE IRON TRADE REVIEW

ery Co., both of Cleveland, bought some miscellaneous equipment.

Several automotive companies figure among the miscellaneous inquirers. The Templar Motors Corp., Halstead avenue, Lakewood, O., desires to obtain a No. 6 milling machine, among other tools. It announces it will spend $700,000 on new buildings and $300,000 on new equipment for them. The F. B. Stearns Co., Cleveland, continues to enter the market from time to time and at present wants a hammer. The Buckeye Engine Co., Salem, O., is receiving quotations on shapers. The Carthage Foundry & Machine Works, Carthage, Mo., wants a new or second hand grinder, suitable for grinding flour mill rolls from 6 to 16 inches in diameter by 36 inches long. The Edward Mfg. Co., Cincinnati, O., wants a 5000-pound press with 3-inch stroke and the Wm. P. Johnston Co., that city, desires a 4-spindle, heavy duty drill press. The Cisco Machine Tool Co., Cincinnati, and the S. Flory Mfg. Co., Bangor, Pa., each wants large gear cutters. The Anderson Roll & Gear Co., Cleveland, desires a 34-inch Gisholt manufacturing automatic, and the National Safe & Lock Co., that city, a saw-sharpening machine as well as some cold saws. The H. O. Vark Bros., Troy, O., wants a small high-speed press, while the J. S. McCormick Co., Pittsburgh, is in the market for a pressure blower and molding machine. The Federal Motor Truck Co., of New York, Inc., 545 West Forty-fifth street, New York, is in the market for a few lathes, drill presses and other small shop tools. The Union Furnace Mfg. Co., Union Furnace, Huntington county, Pa., is receiving quotations on a 3-foot and 3½-foot radial drill. The Dayton Malleable Iron Co., Ironton, O., wants a speed lathe and the Lyle Corrugated Culvert Co., Minneapolis, a No. 11 Williams & White punch and shear. The Spencer Metal Products Co., Spencer, O., wants some steam drop hammers.

Action soon is expected by the Fisher Body Ohio Co., Cleveland, on the huge list of equipment it will require for its new Cleveland plant. This branch of the Fisher Body Corp., Detroit, was incorporated at Columbus last week with $10,500,000 capital by Richard Inglis and Thomas H. Jones, Williamson building, Cleveland.

A few inquiries continue to reach Cleveland from Canada. The Lang Produce & Storage Co., Water street, Brockville, Ont., wants machinery for the manufacture of cans, etc. The Frost Steel & Wire Co., Hamilton, Ont., seeks a 24 x 44-inch x 18-foot gap lathe; one 8-inch x 8-foot engine lathe with compound rest and a 3-foot radial drill.

Tentative inquiries are being issued by some of the railroads whose purchasing agents are making up their 1920 budgets. One of the largest of these is issued by the New York Central railroad, at Cleveland.

Purveyors of heavy equipment are interested in a project at Chillicothe, O., said to be a steel and steel car plant. It is reported that the entire expenditure will be between $49,000,000 and $50,000,000 and about one-third of it is to be spent this year. About 35 cranes will be required according to initial plans. W. H. Monahan Jr., Columbus, O., is the engineer in charge. The Mt. Vernon Foundry & Engineering Co., Mt. Vernon, O., is reported in need of a 10-ton crane.

The Shartle Machine Co., Columbus, O., recently purchased the Portsmouth Engine Co., Portsmouth, O., and will sell the equipment of the foundry, machine shop as well as pattern shop.

Building projects which give promise of large tool needs are as follows: 1-story machine shop, 102 x 170 feet for the Newton Machine Tool Works, Inc., Philadelphia; 3-story machine shop for the Wheeling Stamping Co., Wheeling, W. Va.; 4-story addition to plant of the Dalton Adding Machine Co., Cincinnati, O.; plant for the Cleveland Laundry Machine Co., 5184 Fowler avenue, Cleveland, 90 x 110 feet; 1-story plant, 60 x 350 feet, for the Erie Motor Truck Mfg. Co., Erie, Pa.; 1-story plant for the Dayton Metal Bodies Co., Dayton, O.; 2-story addition for the Randle Machine Co., Cincinnati; 1-story addition for the K-W Ignition Co., Cleveland, and a 55 x 58-foot addition to plant of the Ohio Machine & Boiler Co., University road, Cleveland.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

BIDDEFORD, ME.—The Saco-Lowell Shops will build a 100-foot machine shop addition and also a foundry.

PORTLAND, ME.—The Curlew Co. has been incorporated as a ship builder with $50,000 capital by Frank I. Cowan, H. W. Baston and Clement F. Robinson.

PORTLAND, ME.—The Kingfisher Co. has been incorporated as a ship builder with $50,000 capital by Frank I. Cowan, H. W. Baston and Clement F. Robinson.

PORTLAND, ME.—The Penguin Co. has been incorporated as a ship builder with $50,000 capital by Frank I. Cowan, H. W. Baston and Clement F. Robinson.

LEWISTON, ME.—A $200,000 power plant will be erected near here by the Androscoggin Electric Co.

PORTLAND, ME.—The Teal Co. has been incorporated as a ship builder with $50,000 capital by Frank I. Cowan, H. W. Baston and Clement F. Robinson.

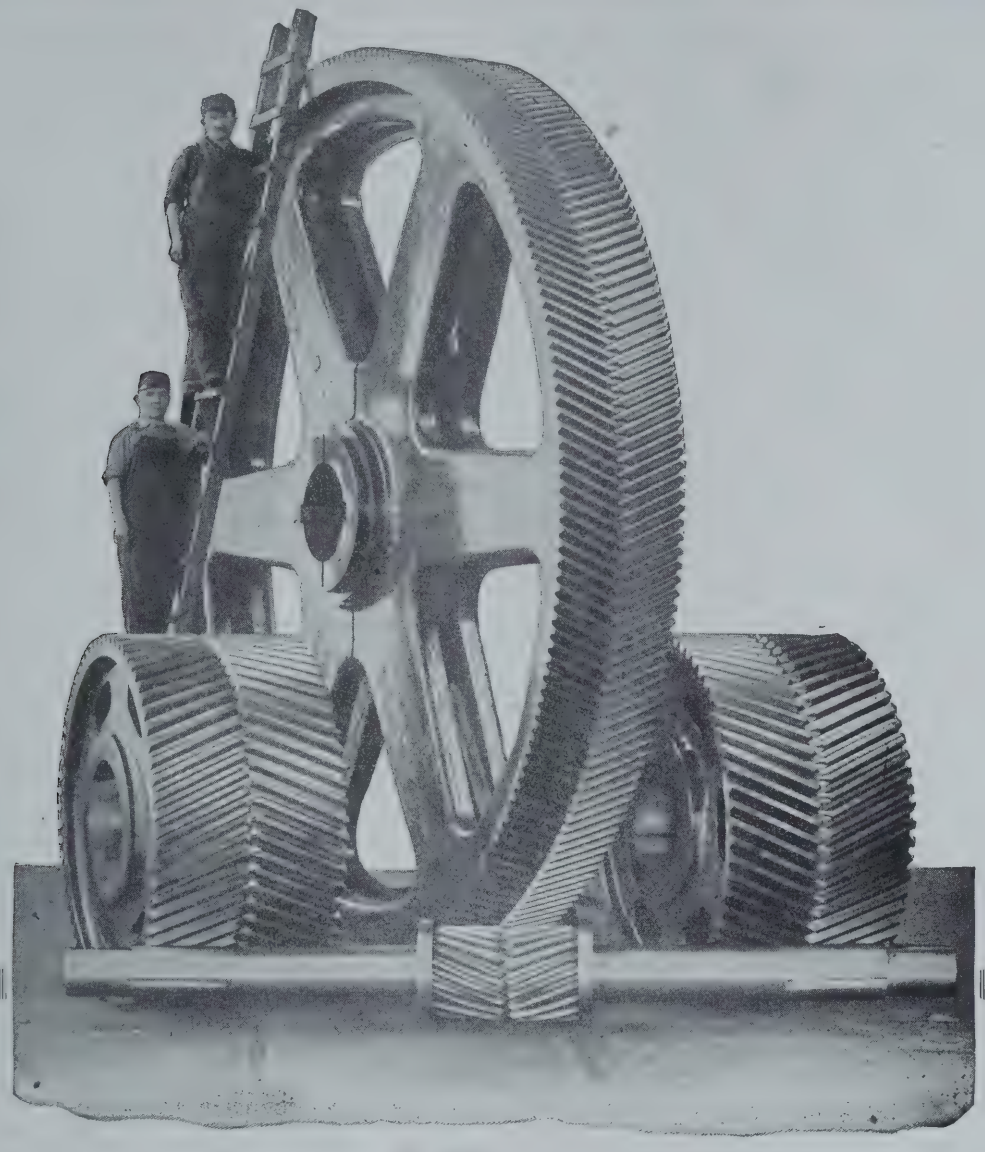
PORTLAND, ME.—The Widgeon Co. has been incorporated as a ship builder with $50,000 capital by Frank I. Cowan, H. W. Baston and Clement F. Robinson.

RUTLAND, VT.—The Vermont Hydro-Electric Co. will build hydraulic plants and a dam to cost $450,000.

WINDSOR, VT.—The Windsor Foundry Corp. will build a 1-story, 80 x 200-foot foundry and will require new equipment.

BOSTON.—The Boston Insulated Wire & Cable Co. contemplate an addition.

BOSTON.—The Fred P. Lambert Co. has been incorporated to deal in metals with $10,000 capital, by John H. Brown, Fred P. Lambert and K. Mulleary.



BOSTON.—The Dustless Victory Sieve Co. has been incorporated with $100,000 capital by Walter F. Goddard, Johan V. Platin and J. J. Walsh.

BOSTON.—The DeBats Special Tool Steel Co. recently was incorporated with $100,000 capital, by J. H. L. DeBats, Edward B. Martin and A. B. Phillips.

BOSTON.—The Mowbar Co. has been incorporated to make screws, bolts, blades, etc., with $200,000 capital by Alvin H. Bacon, Amaden M. Iovine, Meredith, N. H., and Alfred A. Tutin.

CAMBRIDGE, MASS.—The Midvale-Cambria Co. has let the contract for a 1-story, 60 x 149-foot warehouse.

CAMBRIDGE, MASS.—Penniman P. James, Main

Falk Herringbone Gears

Illustration shows a complete set of hobbed herringbone gears, furnished to the United States Aluminum Company for a double duo hot mill drive in their new plant at Edgewater, N. J. The largest gear is 16' in diameter I. D. P. 36" face. All three are made from extra high carbon steel castings, annealed by our special process.

The motor pinion in the foreground is made from a high carbon steel forging, in one piece with the shaft, with a ratio of about 12 to 1 to the large gear. Forged steel shrouds are fitted at the ends of the pinion teeth. Two Fly Wheels are mounted on the pinion shaft and the drive is designed to carry peak loads about 3000 Hp., with speed reduction from 345 to 28 R. P. M. The two small gears transmit about one-third of this power to a second line of rolls at 28 R. P. M.

All castings for large steel gears of this description are made in our own open hearth steel foundry. We furnish steel castings for all purposes from 1 lb. to 100,000 lbs.

Write for interesting Falk literature.

The Falk Company, Milwaukee, Wis.

street, plans a factory and machine shop, 1-story, 150 x 150 feet.

CAMBRIDGE, MASS.—Plans are being drawn for a 1-story, 80 x 80-foot galvanizing building for the Riverside Boiler Works.

EAST BOSTON, MASS.—I. Young & Co., coppersmiths, will build a 2-story, 80 x 75-foot factory and garage to cost $35,000.

FALL RIVER, MASS.—The Fall River Bleachery is building a 1-story, 62 x 242-foot machine shop to cost $40,000.

HOLYOKE, MASS.—Bids closed recently for a warehouse, 2-stories, 60 x 100 feet, for George Prentiss & Co., wire makers. The building will cost $60,000.

LYNN, MASS.—The T. J. Cannon & Sons Machine Co. will build a 1-story, 61 x 70-foot addition for making automobile parts.

LOWELL, MASS.—The Massachusetts Cotton Mills has awarded a contract for a power house, to cost $100,000.

LOWELL, MASS.—The West End Spring Bed Co., Inc., has been incorporated with $10,000 capital by Harry I. Gerson, Samuel Rosenbloom and R. Rosenbloom.

MEDFORD, MASS.—Bids are in for six 1 and 2-story factory buildings and a boiler house to cost $300,000 for the Prest-O-Lite Co., New York.

NEWTON UPPER FALLS, MASS.—The Henry M. Lane Co., Detroit, is preparing sketches for several factory buildings for the Saco-Lowell shops.

PITTSFIELD, MASS.—Plans have been prepared for a $200,000 addition to the plant of the General Electric Co.

SPRINGFIELD, MASS.—The Springfield Foundry Co. has let the contract for a 27 x 66-foot plant addition.

SPRINGFIELD, MASS.—The Bemis & Call Co., hardware and tools, is planning a 4-story plant addition, 50 x 100 feet to cost $45,000.

SPRINGFIELD, MASS.—The Springfield Coach Works has been incorporated with $450,000 capital, by A. U. Premont, M. R. Foster and William S. Fish.

WORCESTER, MASS.—The Pero Foundry has been sold to John E. Jordan.

WORCESTER, MASS.—The Wynan-Gordon Co. has let the contract for a 1-story forge shop.

WORCESTER, MASS.—The Worcester Gas Light Co. has let a contract for a 2-story, 28 x 69-foot generator house.

WORCESTER, MASS.—The Superior Tool & Mfg. Co. has been incorporated with $10,000 capital by August F. Lundquist, Robert Williams, Carl E. Tideman, Ivar W. Alin and Olov G. Johnson.

WORCESTER, MASS.—The Beland Electric Mfg. Co. has been incorporated to build machinery, etc., with $100,000 capital by Lewis H. Peters, Medford, Mass., William H. Phelps, Arthur A. Blanchard, Southbridge, Mass., Albert W. Drake, Somerville, Mass., and Otho Sullivan.

PAWTUCKET, R. I.—Lang & Hoffman, New York, have let the contract for a 1-story, 80 x 90-foot addition to the Woodlawn Machine Screw Co., which they recently purchased.

PROVIDENCE, R. I.—The Franklin Machine Co. has let the contract for a foundry, 42 x 82 feet.

PROVIDENCE, R. I.—The General Copper Co. has been incorporated with $10,000 capital by Archie O. Joslin, Ira Marcus and Daniel J. Healy.

PROVIDENCE, R. I.—The Spartan Needle Co. has been incorporated with $200,000 capital by J. Frank Welcomb, Worcester, Mass., William P. Wood and Arthur M. Allen.

PROVIDENCE, R. I.—The Paco Sharpener Co. has been incorporated to make razor blade shapeners, etc., with $100,000 capital, by William F. Almy, Cranston, R. I., D. Bradford Perkins and Arnold C. Messler.

PROVIDENCE, R. I.—The Domestic Appliance Corp. has been incorporated to make labor saving devices with $25,000 capital by William M. Wilson, Stuart D. Brown and John Wilson, all of Cranston, R. I.

Bridgeport, Conn.—The American Tube & Stamping Co. will build a 60 x 198-foot factory addition.

North Atlantic States

BROOKLYN, N. Y.—The Agenda Novelty Mfg. Co., electrical and mechanical novelties, has been incorporated with $25,000 capital, by F. E. Bloch, H. J. Lauman and D. Goldfogle, 157 East Eighty-ninth street.

BUFFALO.—The Fowler Nail Co. recently awarded a contract for a 1-story plant.

BUFFALO.—The Buffalo Machinery Co. has a permit to erect a building at an estimated cost of $10,000.

BUFFALO.—The Robertson Cataract Electric Co., 748 Hertel avenue, has had plans drawn for a plant addition.

BUFFALO.—The Standard Foundry Co. has had plans drawn for a foundry, 80 x 140 feet, to cost $10,000.

BUFFALO.—The Watkins Commercial Body Corp., 666 Genesee street, has awarded contracts for a plant, 2-stories, 31 x 150 feet, to cost $18,000.

BUFFALO.—The Harding Steel Co., Fidelity building, has a site on which it is reported it will erect a steel fabricating plant. L. A. Harding is president.

DUNKIRK, N. Y.—The Empire Axle Co. has awarded a contract for a plant addition, 1-story, 95 x 200 feet.

HORNELL, N. Y.—The Wymarsh Foundry, Inc., recently was incorporated with $30,000 capital, by F. A. Wygant, G. H. Martin and C. E. Shults.

LONG ISLAND CITY, N. Y.—The A. N. Peterson Co. has had plans drawn for a foundry, 70 x 90 feet.

NEW YORK.—The National Lead Co. has awarded a contract for a plant addition, 5-stories, 50 x 60 feet.

NEW YORK.—The Gordon Radiator Co., 154 West Eighteenth street, has had plans drawn for a plant to cost $60,000.

NEW YORK.—The Dry Dock Sheet Metal Works, 140 West Forty-second street, contemplates a plant, 3-stories, 25 x 100 feet.

NEW YORK.—The Rubes Auto Accesories Mfg. Co. recently was incorporated with $100,000 capital, by D. A. Posner, C. Cobb and W. G. McIvor, 233 Broadway.

NEW YORK.—The Spaulding Chain Corp. recently was incorporated with $50,000 capital, by H. F. Heberman, E. P. Burtis and T. W. Robertson, 43 Cedar street.

NEW YORK.—C. H. Meyn, Inc., metal lathing, has been incorporated with $10,000 capital, by C. M. Meyn, H. G. Dieckhoff and C. L. Grad, 311 West 111th street.

NEW YORK.—The U. S. High Speed Tool Corp. has been incorporated with $750,000 active capital, by M. G. Kline, W. Sisenbergh and I. H. Zinovoy, 1125 Forest avenue.

NEW YORK.—The Kew Mfg. Corp., mechanical engineering, has been incorporated with $20,000 capital, by R. G. Clark, E. H. Owen and C. M. Hayes, 29 Broadway.

NEW YORK.—The Fine & Sternhell Co., foundry and factory supplies, has been incorporated with $7500 capital, by S. Fine, A. Sternhell and H. Vogel, 268 Fest 115th street.

NEW YORK.—Brooks-Harrington, Inc., engines, boilers, etc., has been incorporated with $20,000 capital, by A. S. Marselis, R. E. Brooks and W. G. Harrington, 50 Church street.

NEW YORK.—Phelps, Dodge & Co., 99 John street, have plans for improvements at Morenci, Arizona, costing more than $2,500,000. The program calls for a new concentrating plant.

NEW YORK.—The Hadges & McLain Co., metallurgical and electrical devices, has been incorporated with $100,000 capital, by E. Hadges, H. E. McLain and W. Loomer, 652 Amsterdam avenue.

NEW YORK.—The Ranwood Mfg. Corp., electrical and mechanical engineering, has been incorporated with $200,000 capital, by C. A. Wolf, L. B. Morehouse and M. D. Hird, 80 Fifth avenue.

PORT HENRY, N. Y.—The Port Henry Light & Power Co. contemplates a plant at an estimated cost of $200,000.

ROCHESTER, N. Y.—The Gleason Works has awarded a contract for a foundry addition.

ROCHESTER, N. Y.—The Rochester Forge has been incorporated to fabricate iron and steel with $125,000 capital, by W. H. Kline, E. E. Guntert and G. E. Wynkoop.

SYRACUSE, N. Y.—The C. W. Meade Corp., has been incorporated to manufacture hardware and machine attachments, with $100,000 capital, by C. W. Meade, F. F. Meade, and E. J. Page.

SYRACUSE, N. Y.—The Onondaga Auto Electric Service has been incorporated to manufacture electric apparatus, etc., with $75,000 capital, by W. H. Craig, 718 Allen street, W. N. Henderson, 137 Lexington avenue, and J. M. Dunne, 704 Midland avenue.

TROY, N. Y.—The Eastern Iron Products Co., care of The West Side Foundry Co., has had plans drawn for a plant, 1-story, 60 x 400 feet.

ALLENTOWN, PA.—The International Motor Co. contemplates a plant addition, 2-stories, 300 x 600 feet.

BRANCHTON, PA.—The Branchton Limestone & Ballast Co. has been incorporated with $75,000 capital, by James Lees, C. R. Lees, W. L. Lees, and H. B. Dorning.

ERIE, PA.—The Erie Motor Truck Mfg. Co. plans a plant, 1-story, 60 x 350 feet, to cost $125,000.

HAMBURG, PA.—William Neiman has acquired a site on which to erect a foundry, 144 x 365 feet.

KITTANNING, PA.—The Kittanning Limestone Co. has been incorporated with $50,000 capital, by Charles E. Moals, Fred Norman, D. C. Morgan and others.

NEWARK, N. J.—The Colonial Stamping Co. has had plans drawn for a boiler house addition, 1-story, 25 x 32 feet, to cost $4000.

PHILADELPHIA.—The Wincroft Stove Co. contemplates a factory and office building.

PHILADELPHIA.—A machine shop addition, 1-story, 20 x 54 feet, will be erected here by R. F. Sedgley.

PHILADELPHIA.—The Atlantic Refining Co. will start work shortly on a $60,000 plant addition, 4-stories, 56 x 129 feet.

PHILADELPHIA.—The R. H. Hood Co., 1842 Germantown avenue, has awarded a contract for two plant additions to cost $475,000.

PITTSBURGH.—W. K. Stamets has filed plans for a machine shop to cost $16,000.

PITTSBURGH.—The A. Garrison Foundry Co., has started work on a foundry, 60 x 120 feet, to cost $63,000.

PITTSBURGH.—The Heppenstall Forge & Knife Co. has purchased land adjoining its plant and is reported having plans prepared for an addition.

PITTSBURGH.—The Koppel Car Repair Co. recently was incorporated with $5000 capital, by

R. T. Rossell, E. C. McHugh, F. J. Young and others.

WYOMING, PA.—The Wyoming Shovel Co. has awarded contracts for a plant, 75 x 350 feet.

CAMDEN, N. J.—The American Western Piping Co. has been incorporated to manufacture devices for protection against fire, with $100,000 capital.

CLIFTON, N. J.—The Standard Auto Parts Co. of America, Park Row building, New York, has awarded a contract for a plant here to cost $100,000.

CLINTON, N. J.—The Athenia Steel Co., Colfax avenue, has broken ground for a 2-story plant addition, 50 x 100 feet, to cost $20,000.

ELIZABETH, N. J.—The Hurlbut Motor Car Co. recently was incorporated with $25,000 capital, by W. B. Harley Jr., Paterson, N. J., J. H. Young and P. J. Haas.

NEWARK, N. J.—The United Die & Tool Works, tool making, die cutting, etc., recently was incorporated with $200,000 capital.

NEWARK, N. J.—The Terminal Pattern & Model Works has awarded a contract for a plant addition, 3-stories, 25 x 90 feet.

NEWARK, N. J.—The F. & H. Foundry Co. recently was incorporated with $60,000 capital, by Christian Franz, William Hewitt and Lena F. Moree.

TRENTON, N. J.—The Mitchell-Bissell Co. has awarded a contract for a plant, 1-story, 75 x 260 feet, to be devoted to the manufacture of textile machinery fittings.

UNION, N. J.—The Aeroil Burner Co., Inc., has been incorporated to manufacture torches, oil burners, etc., with $30,000 capital.

UNION, N. J.—The Hind Steel Co. recently was incorporated with $200,000 capital, by Edward W. Blanchard, John and James W. Hind.

WEST ORANGE, N. J.—The Eagle Rock Tool & Mfg. Co., 11 Whittlesey avenue, has been organized by Andrew Erickson and others.

WILLIAMSTOWN, N. J.—The Williamstown Body Works recently was incorporated with $50,000 capital.

WILMINGTON, DEL.—The Lobdell Car Wheel Co. has awarded a contract for a machine shop addition, 2-story, 62 x 65 feet, to cost $16,000.

WILMINGTON, DEL.—The Delaware Marine & Motor Co. has awarded a contract for a machine shop, 1-story, 59 x 200 feet, to cost $22,000.

BALTIMORE.—The Edro Richardson Brass Co., 318 North Holiday street, has taken bids for a brass foundry.

BALTIMORE.—The Baltimore Tube Co. has awarded contracts for a plant, 1-story, 75 x 144 feet, to cost $25,000.

BALTIMORE.—The National Wire Wheels Works, Inc., 625 Equitable building, has been incorporated to do a general machine shop and foundry business, by Eli Frank, C. John Beeuwkes and Bernard R Youngman.

TOWSON, MD.—The Black & Decker Mfg. Co. plans alterations to its plant at an estimated cost of $40,000.

Central States Activity

BELOIT, WIS.—The Auto Trailer Co. is taking bids for a plant, 1-story, 160 x 510 feet, to cost $150,000.

CLINTONVILLE, WIS.—The F. W. D. Auto Co. has completed erecting additions to its plant and is installing a large amount of new equipment. Erection of the company's new Canadian plant at Kitchener, Ont., is nearing completion.

KENOSHA, WIS.—Charles W. Nash of the Nash Motors Co. heads a new corporation formed at Indianapolis with $6,500,000 capital, to manufacture a new automobile.

KENOSHA, WIS.—The Tri-Clover Machinery Co. has been reorganized by Ole Rasmussen, L. C. Thomson and T. Jensen to manufacture brass specialties. Work has started on a new plant to cost $25,000.

NEENAH, WIS.—The Neenah Brass Works has awarded a contract for a plant, 1-story, 30 x 1000 feet, to cost $20,000.

OSHKOSH, WIS.—The Oshkosh Washing Machine Co. contemplates a plant addition, 1-story, 80 x 200 feet.

BENTON HARBOR, MICH.—The Benton Harbor Malleable Foundry Co. has awarded a contract for a plant addition, 80 x 200 feet, to cost $100,000.

DETROIT.—Dodge Bros. are reported planning extensive plant additions.

DETROIT.—The Timken Detroit Axle Co. plans a boiler house, 1-story, 46 x 83 feet.

DETROIT.—The Edmund & Jones Corp., 436 Lawton avenue, contemplates a machine shop.

DETROIT.—The Wolverine Tube Co. has purchased the plant of the Motor Truck Body Co.

DETROIT.—The Cogsdill Mfg. Co. has awarded a contract for an auto parts factory, 1-story, 50 x 70 feet.

DETROIT.—The contract for an addition to the Packard Motor Car Co. has been let to the H. G. Christman Co.

DETROIT.—The steel contract for a 2-story plant for the Freuhauf Trailer Co. has been let to the Kellogg Structural Steel Co., Buffalo.

DETROIT.—The Big Four Stamping Co. recently was chartered with $20,000 capital, by William Peritz, 156 Winona avenue, and others.

DETROIT.—The Detroit Pressed Steel Co. has been reincorporated under the laws of Delaware and is preparing for capitalization and manufacturing expansion.

DETROIT.—The Welles Mfg. Co. has been incorporated with $20,000 capital to manufacture machinery, tools, etc., by H. V. Welles, R. E. Roseberry and Harry Perkins.

DETROIT.—Albert Kahn, architect, Marquette building, is letting contracts for a plant for the Paige-Detroit Motor Car Co. The first unit will be 275 x 600 feet.

DETROIT.—The Knight Metal Products Co. has been incorporated to manufacture automobile accessories, with $500,000 capital, by Harry W. Knight, Albert L. Ellsworth, William H. Brouse and others.

JACKSON, MICH.—The Jackson Stove & Stamping Co. recently was incorporated with $200,000 capital, by Walter V. Sherwood and others.

JACKSON, MICH.—The Central Screw Co., capitalized at $30,000, was incorporated by Robert E. Dwyer and others, to manufacture screw machine products.

KALAMAZOO, MICH.—The plant of the Sanitary Mfg. Co., which was recently damaged by fire, will be rebuilt.

KALAMAZOO, MICH.—The Eddy Paper Co. has started work on a power plant at Three Rivers, Mich., to be 57 x 191 feet.

KALAMAZOO, MICH.—Fuller & Sons Mfg. Co., truck transmissions, will build a plant addition. The company is said to be in the market for equipment.

LANSING, MICH.—The Atlas Drop Forge Co. is reported planning to expend $100,000 in the purchase of new equipment and the erection of a plant addition.

LANSING, MICH.—The Novo Engine Co. is erecting a unit, 130 x 160 feet, to be used as a machine shop.

MARYVILLE, MICH.—The Pressed Metals Co., of Canada, 112 Adelaide street, Toronto, Ont., will build a brass foundry here. Smith, Hynchman & Gulls, 710 Washington arcade, Detroit, are architects.

MENOMINEE, MICH.—The Signal Electric Mfg. Co., electrical and mechanical appliances, has been incorporated with $150,000 capital by Charles E. Hammond, George Fussner and Fred A. Roper.

MUSKEGON, MICH.—The Muskegon Scrap Material Co. has been incorporated with $50,000 capital, by I. and H. Rubinsky.

MUSKEGON, MICH.—The Standard Automotive Parts Co. has been incorporated with $100,000 capital, by Max C. Price and others.

MUSKEGON, MICH.—Fitz John-Erwin Mfg. Co. has been chartered with $100,000 capital to manufacture truck bodies, by H. A. Fitz John and others.

MUSKEGON, MICH.—The Standard Automotive Parts Co. has been incorporated with $100,000 capital, to operate a foundry and machine shop, by L. T. Girdler and others.

OWOSSO, MICH.—The Field Mfg. Co., auto bodies, is completing a plant extension.

OWOSSO, MICH.—The Standard Machine Co. will build an addition 48 x 50 feet.

PLYMOUTH, MICH.—The Reli Tool Steel Foundry Co. has been chartered with $5000 capital by Oliver Goldsmith and others.

PONTIAC, MICH.—The Pontiac Body Co. contemplates three plant additions to cost $250,000.

PONTIAC, MICH.—A 3-story assembly plant, engine plant addition and administration building, will be built by the Oakland Motor Car Co. F. W. Warner is president.

PORT HURON, MICH.—The Chief Motor Co. has purchased a 10-acre site on which it is reported planning to build a plant for the manufacture of automobile engines.

SAGINAW, MICH.—The Lenmar Mfg. Co. has broken ground for a plant addition and has increased its capital from $50,000 to $200,000.

SAGINAW, MICH.—Capacity of the Michigan Crankshaft Co., subsidiary of the General Motors Corp. will be quadrupled. A plant, 160 x 690 feet, will be erected at a cost of $600,000.

ST. IGNACE, MICH.—The Great Lakes Towing & Wrecking Co. will build a dock and machine shop here.

ST. LOUIS, MICH.—The Bollstrom Motors, Inc., has started on a new plant.

SAULT STE. MARIE, MICH.—The Loucks Mfg. Co. has been incorporated with $3000 capital, by Stanley D. Newton, Frederick Loucks and others, to manufacture machinery and do metal casting.

BELLEVILLE, ILL.—The Roesch-Kohl Enamel Range Co. will erect a 50 x 75-foot addition.

CHICAGO.—The Federal Electric Co., 72 West Adams street, is taking bids for a plant to cost $150,000.

CHICAGO.—The William R. Johnston Mfg. Co., 359 East Ohio street, contemplates a plant, 1-story, 120 x 450 feet, to cost $100,000.

CHICAGO.—The Edison Electric Appliance Co., 5660 West Taylor street, contemplates an addition 342 x 355 feet, to cost $270,000.

CHICAGO.—The Pettibone-Mullekin Co., 140 South Dearborn street, has awarded a contract for a steel foundry, 154 x 243 feet, to cost $200,000.

CHICAGO.—Plans are being drawn for a factory and power house for the Simplex Refrigerating Co., 343 South Dearborn street. The buildings will cost $50,000.

CHICAGO.—The Seng Co., 1450 Dayton street, is having plans drawn for an office building, two stories, 60 x 260 feet, a machine shop, one story, 200 x 900 feet, a service building, three stories,

50 x 220 feet, and a power plant and assembly hall.

CHICAGO.—The Seng Co., 1450 Dayton street, will build a plant, including an office building, 60 x 260 feet, machine shop, 200 x 900 feet, and service building, 50 x 220 feet, to cost $1,500,000. Davidson & Weiss, 53 West Jackson boulevard, are architects.

ELGIN, ILL.—Woodruff & Edwards contemplate a foundry addition, 85 x 132 feet, to cost $10,000.

ELMHURST, ILL.—The Kellogg Mackay Equipment Co. has had plans drawn for a plant.

FREEPORT, ILL.—The H. W. Horst Co., Rock Island, Ill., is building a 5-story building for the Furst McNess Co., manufacturing chemists.

GALESBURG, ILL.—The Row Mfg. Co. will build a factory building and will also install a bolt plant. Other improvements contemplated include a loading track extension. Six acres have been acquired for plant additions.

JACKSONVILLE, ILL.—This city will build a filtration plant at an estimated cost of $25,000.

JOLIET, ILL.—The Moore Bros. Co. contemplates a foundry, 67 x 70 feet, to cost $20,000.

JOLIET, ILL.—The Joliet Building Material & Contracting Co. is a new corporation capitalized at $20,000 by C. A. Vanfleet, E. R. Synold and E. R. Synold.

MT. VERNON, ILL.—The Mt. Vernon Car Mfg. Co. has had plans drawn for a foundry.

PEORIA, ILL.—The Burn-Oil Tractor Co. will increase its working space by the addition of a building containing 400 square feet.

PEORIA, ILL.—The Peoria Auto Signal Co. has been incorporated with $50,000 capital, and will manufacture automobile parts and devices. J. S. Barton is interested in the company.

SPRINGFIELD, ILL.—The Illinois Watch Co. has awarded the Austin Co. a contract to erect a 3-story addition, 80 x 144 feet, at an estimated cost of $100,000.

TORONTO, ONT.—The Toronto Can Co., Ltd., has been incorporated with $40,000 capital, by William E. Ross, 57 Westmorland avenue, James A. Ross and others.

TORONTO, ONT.—The Kerr File & Tool Co., Ltd., has been incorporated to manufacture files, etc., with $40,000 capital, by George A. Marshall, 182 Spadina road, George H. Kerr, 9 Fisher street, and others.

TRAIL, B. C.—The Consolidated Mining & Smelting Co. is considering plans for the installation of two concentrating plants at Rossland and Kimberly.

Business Changes Recently Announced

IN ORDER to take care of its business in and around Pittsburgh and eastern Ohio, the Hyman-Michaels Co., of Chicago, with branches in St. Louis, and East Chicago, Ind., has opened an office in Pittsburgh, which will be in charge of F. S. Easterly and located in the First National Bank building, Pittsburgh.

* * *

The Rockwell-Drake Corp., Plainville, Conn., has changed its name to the Standard Steel & Bearings Co., Inc., and will continue to make ball bearings. An addition to the factory is under construction which will give it 60,000 more square feet of floor space and enable the company to double its output.

* * *

The Lyon Metallic Mfg. Co., Aurora, Ill., manufacturer of steel shelving, lockers, boxes, cabinets and general steel equipment, announces the opening of a new district sales office in Philadelphia at 519 Bulletin building, with R. J. Nyce in charge.

* * *

The Black & Decker Mfg. Co., manufacturer of portable electric tools, has removed its general office from Baltimore to Towson Heights, Md.

* * *

John Helmuth & Co., dealers in iron and steel, have resumed their main office at 30 Church street, New York. For the past five years, or during the war, main headquarters have been maintained in the Union Arcade building, Pittsburgh. The Pittsburgh office will be retained as a sales office to supply the territory to the west of that city, as well as to develop further the company's steel conversion business.

* * *

The Baldwin Locomotive Works, Philadelphia, has established South American headquarters at Buenos Aires. The office was opened by Wallace Lee, who since has been joined by Alfred D. Chandler Jr., and Senor Tirado.

* * *

The Reading Iron Co., Reading, Pa., recently established district sales offices in Pittsburgh and Chicago. F. M. English and R. A. Griffin, respectively, are in charge.

* * *

The Emerman Co., Erie, Pa., dealer in iron and steel scrap, has opened a branch office in Cleveland, at 306 American Trust building, under the direction of President Harvey Emerman and Louis B. Emerman.

* * *

The Peninsular Steel & Iron Co., Detroit, has changed its name to the Peninsular Steel Co.

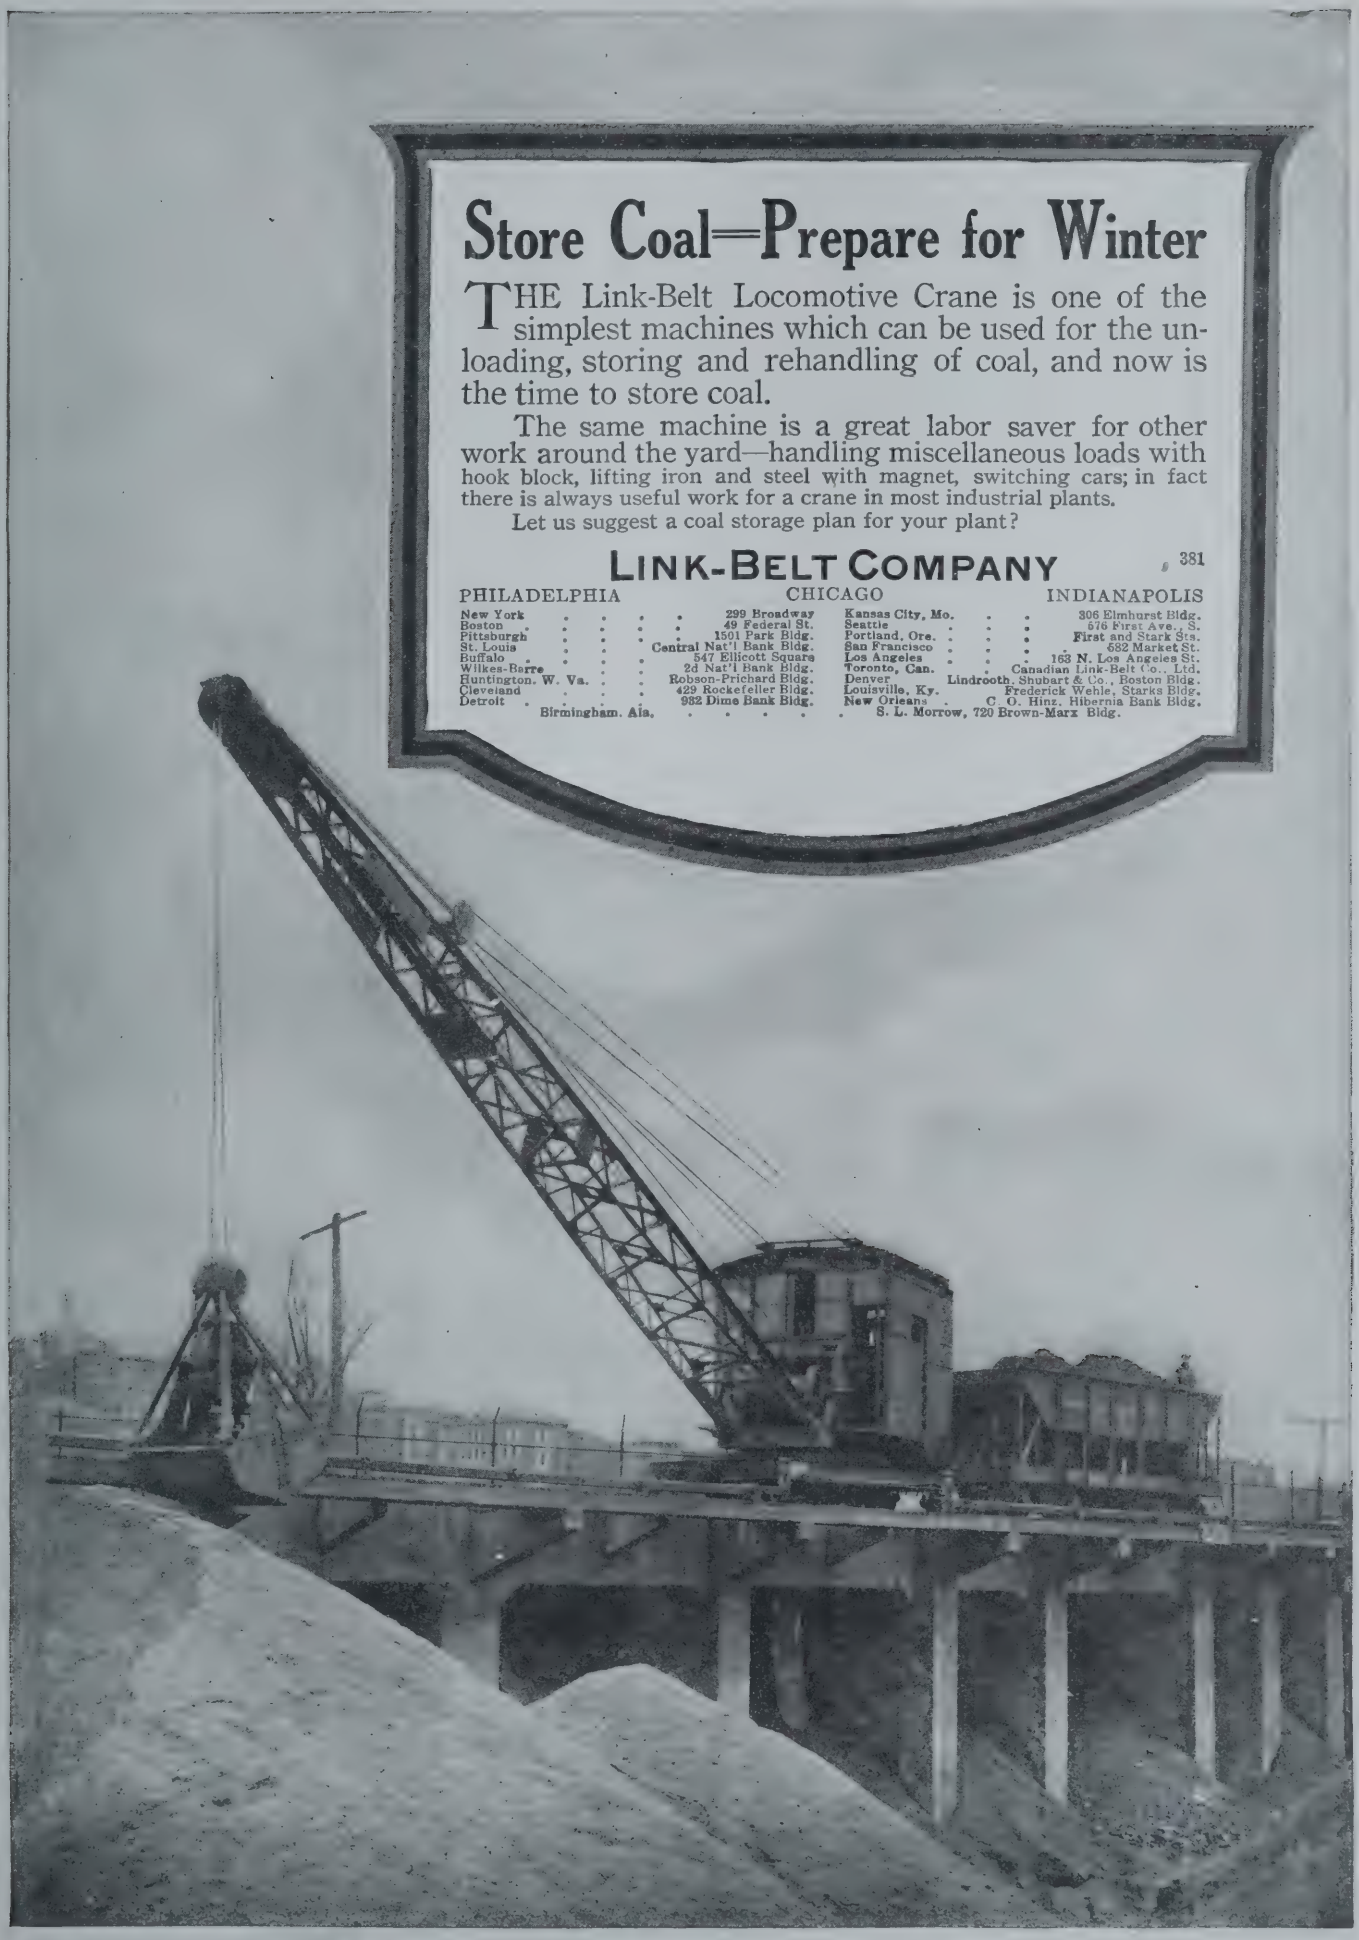
Store Coal—Prepare for Winter

THE Link-Belt Locomotive Crane is one of the simplest machines which can be used for the unloading, storing and rehandling of coal, and now is the time to store coal.



The same machine is a great labor saver for other work around the yard—handling miscellaneous loads with hook block, lifting iron and steel with magnet, switching cars; in fact there is always useful work for a crane in most industrial plants.

Let us suggest a coal storage plan for your plant?

Say you saw it in THE IRON TRADE REVIEW

Iron and Steel Scrap Prices

Corrected to Tuesday Noon

Steel Works Scrap

Gross Tons Delivered to Consumer

HEAVY MELTING STEEL

Pittsburgh	$20.00 to 20.50
Chicago	19.00 to 19.50
Eastern Pennsylvania	19.00 to 20.00
Cleveland	18.75 to 19.25
St. Louis	18.50 to 19.00
Buffalo	19.00 to 20.00
New York (dealers)	15.50 to 16.00
Cincinnati	16.50 to 17.00
Birmingham	20.00 to 21.00
Valleys	19.50 to 20.00
Boston (dealers)	15.50 to 16.50

BUNDLED SHEETS

Pittsburgh	15.00 to 15.50
Eastern Pennsylvania	16.00 to 16.50
Cleveland	13.00 to 13.50
Buffalo	14.50 to 15.00
Cincinnati	12.50 to 13.00
St. Louis	11.50 to 12.00

STEEL RAILS, SHORT

Chicago	$21.50 to 22.00
Boston (dealers)	15.50 to 16.00
Cleveland	17.00 to 17.50
St. Louis	22.50 to 23.00
Birmingham	19.00 to 20.00
Cincinnati	20.50 to 21.00

STOVE PLATE

Pittsburgh	$19.00 to 20.00
Chicago	25.00 to 25.50
Eastern Pennsylvania	21.00 to 22.00
Cleveland	19.25 to 20.25
St. Louis	22.00 to 22.50
Buffalo	22.00 to 22.50
New York	17.50 to 18.00
Cincinnati	16.50 to 17.00
Birmingham	20.00 to 21.00
Boston	19.00 to 20.00

LOW PHOSPHORUS

Pittsburgh, billet and bloom crops.	$24.00 to 25.00
Chicago, billet and bloom crops	24.00 to 25.00
Eastern Penn. (guaranteed)	25.75 to 26.25
Buffalo	23.50 to 24.00

SHOVELING STEEL

Chicago	$18.00 to 18.50
St. Louis	17.50 to 18.00

KNUCKLES, COUPLERS AND SPRINGS

Pittsburgh	$21.00 to 21.50
Chicago	21.00 to 21.50
St. Louis	19.00 to 19.50

BALED SHEETS

Pittsburgh	17.00 to 17.50
Chicago	15.00 to 15.50

FROGS, SWITCHES, GUARDS

Chicago	$19.00 to 19.50
St. Louis	19.00 to 19.50
Eastern Pennsylvania	19.00 to 20.00

BOILER PLATE, CUT

Chicago, No. 1	$15.50 to 16.00
St. Louis	14.50 to 15.00

ANGLE BARS—STEEL

Chicago	$20.50 to 21.00
St. Louis	19.00 to 19.50

Iron Mill Scrap

Gross Tons Delivered to Consumer

RAILROAD WROUGHT

Pittsburgh, No. 1	$22.00 to 23.00
Pittsburgh, No. 2	20.00 to 20.50
Chicago, No. 1	22.50 to 23.00
Chicago, No. 2	21.25 to 21.50
Eastern Pennsylvania, No. 1	27.00 to 28.00
Cleveland, No. 1	23.25 to 23.75
St. Louis, No. 1	21.00 to 21.50
St. Louis, No. 2	20.00 to 20.50
Buffalo	23.00 to 23.50
Cincinnati, No. 1	19.50 to 20.00
Birmingham, No. 1	17.00 to 18.00
New York, No. 1 (dealers)	24.00
Boston (dealers)	18.50 to 19.00

WROUGHT PIPE

Eastern Pennsylvania	$18.00 to 19.00
Eastern Pennsylvania, ungraded	13.00 to 14.00
Buffalo	17.50 to 18.00
New York (dealers)	15.00 to 15.50
Boston (dealers)	14.00 to 14.50

YARD WROUGHT

Eastern Pennsylvania, No. 1	$22.00 to 23.00

CITY WROUGHT

New York, long (dealers)	19.00 to 19.50

BUSHELING

Chicago, No. 1	$19.00 to 19.50
Chicago, No. 2	13.00 to 13.50
Cleveland, No. 1	17.00 to 17.50
Cleveland, No. 2	14.50 to 15.00
St. Louis, No. 1	18.50 to 19.00
Buffalo, No. 1	16.50 to 17.50
Cincinnati, No. 1	14.50 to 15.00
Eastern Pennsylvania, No. 1	15.00 to 16.00

MACHINE SHOP TURNINGS

Pittsburgh	$12.50 to 13.00
Chicago	9.00 to 9.50
Eastern Pennsylvania	15.00 to 16.00
Eastern Pennsylvania (blast furn.)	14.00 to 15.00
Eastern Pennsylvania (chemical)	18.50 to 19.50
Cleveland	9.00 to 9.50
Buffalo	12.00 to 12.50
New York (dealers)	11.00 to 11.50
St. Louis	12.00 to 12.50
Cincinnati	7.50 to 8.00
Birmingham	13.00 to 14.00
Valleys	11.00 to 11.50
Boston (dealers)	10.00 to 10.50
Boston (blast furnace) (dealers)	10.50 to 11.00

CAST IRON BORINGS

Pittsburgh	$15.50 to 16.00
Chicago	11.00 to 11.50
Eastern Pennsylvania	16.00 to 17.00
Eastern Pennsylvania (chemical)	18.50 to 19.00
Cleveland	13.00 to 13.50
St. Louis	12.00 to 12.50
Buffalo	13.50 to 14.00
New York (dealers' price)	13.00 to 13.50
Cincinnati	9.00 to 9.50
Birmingham	13.00 to 14.00
Valleys	14.25 to 14.75
Boston (dealers)	13.00 to 14.00
Boston (blast furnace) (dealers)	12.00 to 12.50

IRON AXLES

Pittsburgh	$34.00 to 35.00
Chicago	33.00 to 34.00
Eastern Pennsylvania	35.00
Cleveland	35.00 ao 36.00
St. Louis	32.00 to 32.50
Buffalo	28.00 to 29.00
Cincinnati	23.00 to 23.50

IRON RAILS

Chicago	24.50 to 25.00
Cleveland	27.00 to 28.00
St. Louis	22.50 to 23.00
Buffalo	24.00 to 25.00
Cincinnati	23.00 to 23.50

PIPES AND FLUES

Chicago	16.50 to 17.00
Cleveland	16.25 to 16.75
St. Louis	16.50 to 17.00
Cincinnati	15.00 to 15.50

GRATE BARS

Chicago	$22.00 to 22.50
Cleveland	21.00 to 21.50
Buffalo	20.00 to 20.50
New York	16.50 to 17.00
Eastern Pennsylvania	20.00 to 21.00

FORGE FLASHINGS

Cleveland, large	$13.00 to 13.50
Cleveland, small	16.25 to 16.25
Chicago, small	14.00 to 14.50
Boston (dealers)	12.00 to 12.50

FORGE SCRAP

Chicago	$21.00 to 21.50
Eastern Pennsylvania, No. 1	16.00 to 16.50
Boston	10.50 to 11.00

ARCH BARS AND TRANSOMS

Chicago	26.50 to 27.00
St. Louis	21.50 to 22.00

ANGLE BARS—IRON

Chicago	$25.50 to 26.00
St. Louis	21.00 to 21.50

Gross Tons Delivered to Consumer

AXLE TURNINGS

Pittsburgh	$16.00 to 17.00
Eastern Pennsylvania	16.00 to 17.00
Boston (dealers)	11.50 to 12.00
St. Louis	12.50 to 13.00
Cleveland	17.00 to 17.50
Buffalo	16.00 to 17.00
Chicago	14.50 to 15.00

STEEL CAR AXLES

Pittsburgh	$27.00 to 28.00
Eastern Pennsylvania	32.00
Cleveland	34 00 to 35.00
St. Louis	29.00 to 29.50
Buffalo	28.00 to 29.00
Chicago	27.50 to 28.00
New York (dealers)	24.00 to 25.00
Birmingham	21.00 to 22.00
Boston (dealers)	24.50 to 25.00

SHAFTING

Eastern Pennsylvania	$26.00 to 28.00
St. Louis	28.00 to 28.50
New York (dealers)	24.00
Chicago	27.50 to 28.00

Iron Foundry Scrap

Gross Tons Delivered to Consumer

CAR WHEELS

Pittsburgh, iron	$24.00 to 24.50
Pittsburgh, steel	21.50 to 22.00
Chicago, iron	24.50 to 25.00
Eastern Pennsylvania, iron	24.50 to 25.00
Cleveland, iron	23.00 to 24.00
St. Louis, iron	23.50 to 24.00
Buffalo, iron	22.50 to 23.50
Birmingham, iron	20.00 to 21.00
Birmingham, tram car	19.00 to 20.00
Boston	23.00 to 24.00
Cincinnati	21.00 to 21.50

NO. 1 CAST SCRAP

Pittsburgh, cupola	$25.00 to 26.00
Chicago, cupola	28.75 to 29.25
Eastern Pennsylvania, cupola	25.00 to 26.00
Cleveland, cupola	25.50 to 26.00
New York, cupola (dealers)	22.50 to 23.00
Cincinnati, No. 1, cupola	21.50 to 22.00
Birmingham, cupola	24.00 to 25.00
St. Louis, railroad	27.50 to 28.00
St. Louis, agricultural	26.50 to 27.00
Buffalo	24.50 to 25.00
Boston	28.00 to 28.50
Valleys	25.00 to 25.50

HEAVY CAST

New York (dealers)	22.00 to 22.50
Buffalo	21.00 to 22.00
Pittsburgh	22.00 to 23.00
Cleveland	18.50 to 19.00
Boston	19.00 to 19.50

MALLEABLE

Pittsburgh, railroad	$24.00 to 25.00
Pittsburgh, agricultural	20.00 to 20.50
Chicago, railroad	22.00 to 22.50
Chicago, agricultural	22.00 to 22.50
Eastern Pennsylvania, railroad	20.00 to 21.00
Cleveland, railroad	20.50 to 21.00
Cleveland, agricultural	17.75 to 18.50
St. Louis, railroad	18.50 to 19.00
St. Louis, agricultural	16.50 to 17.00
Cincinnati, railroad	15.00 to 15.50
Cincinnati, agricultural	14.50 to 15.00
Boston	19.50 to 20.50
Buffalo	19.00 to 20.00

Miscellaneous Scrap

Gross Tons Delivered to Consumer

REROLLING RAILS

5 feet and over

Pittsburgh	$25.00 to 26.00
Chicago	28.00 to 28.50
Eastern Pennsylvania	Nominal
Cleveland	26.00 to 27.00
St. Louis	26.50 to 28.00
Birmingham	23.00 to 24.00
Boston (dealers)	20.00 to 20.50

LOCOMOTIVE TIRES

Chicago	20.50 to 21.00
St. Louis	19.00 to 19.50

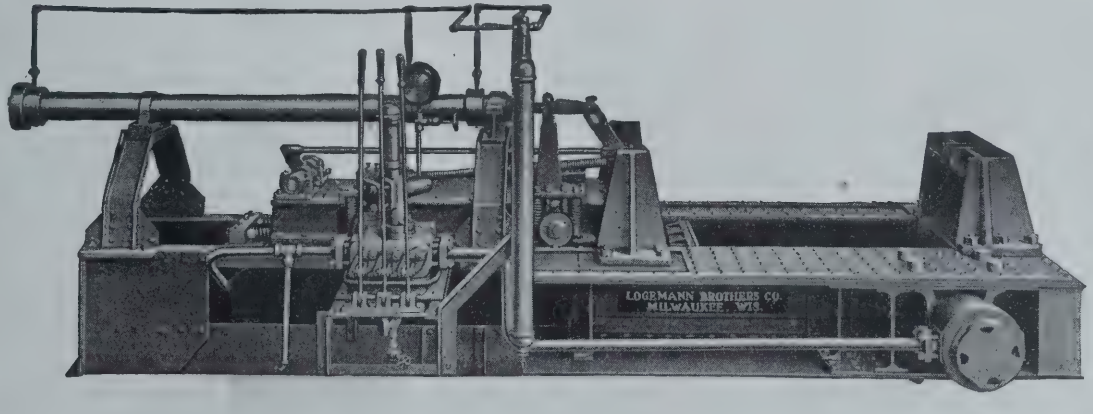
BOILER PUNCHINGS

Chicago	$24.00 to 25.00
Eastern Pennsylvania	23.00 to 24.00

When the Scrap Market Is Dull

While seeking a more favorable market the best form in which to hold your sheet scrap, etc., and the form that always commands the best prices is the dense hydraulically compressed bundle.

Thus less storage space is required—under roof to prevent loss from corrosion; and because of greater car tonnage under minimum car rate, you add from 25% to 50% freight savings to your profits.



For greatest compression, largest daily output, at lowest operating cost, use

LOGEMANN Double Ram Hydraulic Scrap Metal PRESSES

You can enjoy the advantage of the accumulated experience from hundreds of Logemann scrap bundling presses now in use.

They embody a simplified mechanism that requires no special skill to operate rapidly. Press and pump are so designed that all the motive power applied is utilized, thus reducing power cost.

Powerfully built, all working parts constructed to resist the severest strains—selected material, first class workmanship—all minimize upkeep cost and insure lasting efficiency.

A medium sized press is shown; there are smaller and larger sizes in standard models.

Advise character and daily tonnage of your scrap and let us suggest press best suited to your requirements.

Logemann Brothers Co.

3126 Burleigh Street

New Trade Publications

MARINE EQUIPMENT.—Anchors of all kinds, ship cleats, mooring posts, towing bitts, mooring rings, capstans, deck scuttles, ventilators, hawse reels, hawse pipes, deck irons, propellers, and other marine equipment are fully illustrated in a 56-page booklet being distributed by the Thacher Propeller & Foundry Corp., Albany, N. Y. Specifications and other data are given.

PRESSED METAL.—Entitled, "The Possibilities of Pressed Metal Engineering," an illustrated booklet is being circulated by the Boston Pressed Metal Co., Worcester, Mass. The booklet contains a number of illustrations of what has been accomplished by pressed metal engineering. Medium seamless drawn shapes, seamless drawn ferrules, and other types of seamless products are mentioned at length.

AIR HOISTS.—A variety of types of air hoists, both vertical and horizontal, are described and illustrated in a 24-page booklet recently published by the Whiting Foundry Equipment Co., Harvey, Ill. These hoists are of especial use in plants where the use of electricity is prohibitive. Compressed air and hydropneumatic elevators are also described and illustrated. The booklet contains general information and data pertaining to the equipment.

ELECTRIC FURNACE.—A standard electric furnace for the melting of brass is described and illustrated in a 16-page bulletin, recently published by the Electric Furnace Co., Alliance, O. In this furnace, electrodes are not used as a heating medium, the only service which they perform being their use to carry current into the resistor trough which forms the heating element. Other information given covers charging, melting and pouring, auxiliary mechanism and typical records. A number of actual installations are illustrated.

FIRE BRICK.—An attractive cloth-bound 56-page booklet is being circulated by John G. Stein & Co., Ltd., Bonnybridge, Scotland. The booklet contains views of the company's works, a description of one of the company's plants, miscellaneous weights and measures, sizes of bricks for various circles, testimonials, etc. Pages 23 to 40 inclusive contain illustrations of the various types and sizes of bricks manufactured, such as squares, scones or splits, side arch or culvert, end arch, etc. One section of the booklet contains line drawings of gas retorts, blast furnaces, hot blast stoves, cupola furnaces, open-hearth furnaces and gas producers, showing how and where the various kinds of brick are used.

CHAIN.—A booklet has been published by the Howe Chain Co., Muskegon, Mich., in which various kinds of chain manufactured by the company are described and illustrated. Among the chains described are straight line malleable detachable chain, closed end pintle chain, sawmill pintle chain, heavy closed end pintle chain, double locked chain, malleable iron and steel combination chain, ley bushed chain, malleable iron roller chain, etc. All of these types are fully described and illustrated and the uses to which they are suited are enumerated. Part of the booklet contains illustrations and descriptions of malleable iron elevator buckets, which also are manufactured by the company.

CONVERTER.—Catalog No. 150, issued by the Whiting Foundry Equipment Co., Harvey, Ill., is devoted to illustrating and describing a side-blow converter. The shell of the converter is of heavy steel plates. It is equipped with a dished bottom and removable top, and is supported by heavy cast iron standards in which trunnions are pivoted. The journals are of large area and the bearings are provided with removable caps and arranged for proper lubrication. A tipping mechanism is operated by an electric motor and consists of three reductions of cut gearing. The blast is conveyed to the tuyere box through the trunnion opposite the one used for tipping. This trunnion is connected to the tuyere box by a cast iron wind box. The tuyere box has a removable cover.

CUPOLA.—Catalog 146, a 44-page booklet published by the Whiting Foundry Equipment Co., Harvey, Ill., describes and illustrates cupolas manufactured by the company. Details on design and construction are given, as well as other data, including a table of sizes and capacity and descriptions and illustrations of cupola accessories. These cupolas are of heavy construction. The supporting columns are curved to allow the bottom door to clear in dropping. The shell is of steel plate, and the joints of stacks open downward and on the outside. Two rows of tuyeres are provided, which are flaring in shape and admit the blast through a small area in the shell, which is expanded into a large horizontal opening inside the shell of the cupola. Other parts are described and the booklet is replete with illustrations of equipment and actual installations.

ELECTRIC BRASS FURNACE.—A bulletin entitled, "Electric Furnaces in the Brass Rolling Mill," has been published by the Electric Furnace Co., Alliance, O. It contains a number of illustrations, several of actual installations, and a description of an electric furnace which the company manufactures. The furnace described is of the standard resistance type. It is rated at 105 kilowatts and has a hearth capacity of 1500 to 2000 pounds and a melting time of two hours. The cylindrical shell of the furnace is supported in front upon cast iron trunnions and in the rear by a screw which may be raised and lowered by a motor placed beneath the floor. A bowl shaped hearth located in the bottom of the furnace is lined with plastic material and is contained in a steel pan. The maximum capacity of the hearth is said to be a one ton charge.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

DISTRICT OFFICES

New York, 734 Customhouse; Boston, 1801 Customhouse; Chicago, 504 Federal bldg.; St. Louis, 402 Third Nat'l Bank; New Orleans, Hibernia Bank; Seattle, Henry bldg.; San Francisco, 307 Customhouse

CO-OPERATIVE OFFICES

Cleveland, Chamber of Commerce; Cincinnati, Chamber of Commerce; Los Angeles, Chamber of Commerce; Philadelphia, Chamber of Commerce; Portland, Oreg. Chamber of Commerce; Dayton, Ohio, Chamber of Commerce; Pittsburgh, Chamber of Commerce

A manufacturer in Scotland desires to purchase, with exclusive selling rights in the British Isles, supplies for builders, such as sanitary fittings, plumbing materials, etc. Opportunity No. 30877.

A firm in Spain desires to be placed in touch with makers of appliances for concentrating graphite. Opportunity No. 30878.

An agency is desired by a party in Italy for the sale of machinery and tools for metal and woodworking. Correspondence should be in Italian. Opportunity No. 30879.

Catalogs of hardware and textile machinery are desired by a firm in China. Opportunity No. 30884.

A representative of a firm in Java, expected in this country shortly, is desirous of getting in touch with manufacturers and exporters for the sale of safes, water filters, expanded metal, fencing and other supplies. Opportunity No. 30888.

An American consulting engineer located in Japan, who acts as buyer for several Japanese dockyards, one steel works and several government contractors, has asked for catalogs and prices from manufacturers with a view to establishing agencies for the sale of mining machinery, railway and dockyard equipment, power plants and machine tools. Opportunity No. 30889.

Plumbing material, bathroom fixtures, hardware, tools, zinc, tinware, iron and steel goods, electrical goods and supplies, tractors, agricultural machinery, etc., will be purchased by a commercial agent from Bolivia who will arrive in this country shortly. Opportunity No. 30891.

The representation of manufacturers of cash registers, marking apparatus, time recorders, etc., is desired by a commercial agent in Sweden. Opportunity No. 30895.

Agencies from American exporters and manufacturers for the sale of building materials, metals, technical instruments, machinery, etc., are desired by a merchant in Poland. Opportunity No. 30896.

A municipality in Colombia is in the market for fire department equipment, including ladders, chemical engines, masks, pumps, fire engines, etc. Correspondence should be in Spanish. Opportunity No. 30899.

The urban district council of a city in England desires to purchase 2000 tons of cast iron pipe for use in connection with the city's water supply. It is advised that bidders cable direct with a follow letter giving details. Opportunity No. 30902.

The government of a European country desires to place a trial order for six or more tractors. Opportunity No. 30905.

An agency is desired by a party in Italy for the sale of chemical products, hardware, brass goods, sewing machines, shoe machinery, typewriters, etc. Correspondence should be in Italian. Opportunity No. 30907.

The purchase of wire, wire rope, etc., is desired by a firm in England. Opportunity No. 30910.

A firm in Italy desires to purchase a machine for rolling lead and tin in sheets, having cylinders 900 millimeters in width and 400 millimeters in diameter; and a machine for cutting and rolling lead and tin sheets prior to winding same on spools. Correspondence should be in Italian or French. Opportunity No. 30913.

An American firm desires to purchase from manufacturers for export to its clients in the Orient, agricultural implements, hardware, tools, wire and sheets, chemicals, etc. Opportunity No. 30915.

Material and equipment for a railway to be built in one of the Scandinavian countries, including construction machinery, rails, rolling stock, etc., will be needed. Information, descriptions, illustrations, estimates, etc., are requested. Opportunity No. 30918.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, October 30, 1919 *No. 18*

Coal Strike Overhangs Market

Steel Producers Shut off Quotations and Sales Awaiting Week's Developments—Rail Sales Closed for Next Year at Unchanged Price — Early Material of all Classes Exceedingly Scarce—Output Steadily Gains

COAL strike possibilities are being anticipated by the iron and steel industry and constitute the ruling factor in the market for the present. Various producers of finished steel who have been accepting new business right along for forward delivery abruptly have terminated this practice and will make no further quotations until the situation clears. Some of them have recalled outstanding quotations. The result is that prices in many lines have become purely nominal and much business is suspended. Should the strike be averted and selling resumed, it is not believed likely that any permanent general price advances in finished steel will take place because the larger interests still are pursuing a policy of restraint against higher quotations.

The stronger market on semifinished steel and such raw materials as pig iron and certain grades of scrap which is based on increased operating costs and general scarcity, however, continues to hold prices at an advanced level. The sheet situation has become exceedingly tight and in the Youngstown district the limited tonnage available is moving at an advance of several dollars a ton. Eastern plate and shape makers no longer will equalize the Pittsburgh freight for western delivery.

More Plants Running

Interference by the Ohio state authorities in the steel strike situation at Canton, is helping along the restoration of operations at that point. This action likewise promises to work benefits to other Ohio districts where the inability or unwillingness of local officials to afford proper protection to the workmen materially has retarded the resumption of plants. General production of iron and steel is forging ahead steadily and reduced efficiency is being overcome by degrees. The shortage of common labor is a source of considerable difficulty. The Carnegie Steel Co. is producing at the rate of 70 per cent of total ingot capacity and the entire Pittsburgh district is 80 per cent or more active. The largest sheet maker is operating 85 per cent full and independent sheet mills at 80 per cent of the rate of production before the strike. At Gary and Indiana Harbor operations are at 75 per cent.

Iron Still on Rise

Pig iron sales for next year on a higher level generally established a week or so ago, have been heavy. A shortage of early iron is growing constantly more acute and this is resulting in various premiums being paid. The restricted supply of open top cars because of the coal crisis is seriously hampering shipments in some districts. A large central western interest with furnaces in the valley and along the lakes has booked 100,000 tons of foundry and malleable iron for first half delivery during the past few weeks at a $2 advance and now has withdrawn. Chicago makers have made a second advance in as many weeks and are naming $30 furnace for the base grade, representing a total rise of $3.25. Eastern irons generally are moving higher. A 10,000-ton sale of malleable for first half has been made at Buffalo at 29.50 furnace. Basic iron is backward but there is an nonconfirmed report at Pittsburgh of a sale of 20,000 tons for next year on a higher basis.

Some Rails are Sold

A widely-circulated report that standard open-hearth rails have been advanced $2 to $49 mill has been due to a misappresension of a quotation at Chicago made on a round tonnage for western roads. The price remains $47 and sales at this figure have been made by an independent mill for next year's delivery. It is believed that these are the first orders to be taken direct from the railroads in anticipation of their return to private control. Similar rail negotiations at Chicago involve at least 100,000 tons.

Foreign purchasers of iron and steel are showing a tendency to hold back because of immediate uncertainties affecting deliveries. An inquiry for 10,000 coal cars for Belgium requiring 65,000 tons of steel in addition to the axles is before American builders. An inquiry for 50,000 tons of relaying rails for Chile is reported. A 30,000-ton sale of shipbuilding material to Japan is credited to the Steel corporation.

Labor Obeys "That Impulse"

WITHDRAWAL from the national industrial conference by representatives of organized labor was typical of the position they have taken on all great issues involving the peace of industry which have been presented in recent years. It confirms the opinion held by many impartial observers that no progress can be made toward an equitable settlement of industrial problems until organized labor's leaders are made to respect obligations.

In the case of the industrial board those leaders were willing enough to proceed in accordance with rules agreed on by the board; they were willing to accept all the advantages that might result from the conference, but when they lost a point they promptly withdrew, and charged that the game was not played fair. It is another instance in which the representatives of trade unions have demonstrated that they will either dictate or destroy.

The withdrawal of the delegates under the circumstances that obtained, and in opposition to President Wilson's expressed desire that further thought be given to a program for industrial harmony, must have convinced the employers' and public groups that negotiations of this character are futile unless there be a clear understanding that labor, like the other parties to the conference, be pledged to abide by its decisions.

Collective bargaining was agreed to by the representatives of the employers, and it was agreed that the employes might select representatives of their own choosing, but the employers would not bind themselves to deal with representatives selected from outside of the shop personnel. Such an agreement would in effect bind them to a recognition of trade unions and the closed shop. The labor group tried to make it appear that the closed shop was not the issue; that their resolution providing for collective bargaining was an innocent measure, establishing a principle they declared to be universally recognized, but when the "joker" was revealed, and when it was shown how the resolution was susceptible of interpretation the labor group promptly withdrew.

The violation of labor's obligations to continue until the various issues were discussed and decided upon, then to accept or reject them as a whole if it did not consider itself bound to abide by the decisions of the conference, was so bald as to suggest that other reasons were at the foundation. At about the same time the Gompers resolution for collective bargaining was voted down his resolution for arbitration of the steel strike and for the principle of the open shop also was defeated, by action of the public group. The matter of collective bargaining might have been brought up at a later date and an agreement obtained satisfactory to all parties; the breach was not sufficiently wide to warrant labor walking out. But with final action taken on the steel strike, Gompers and his confreres realized that they had lost the strike and decided there was no more use for the conference.

Conferences such as that at Washington might serve a very useful purpose in extricating labor chieftains from a difficult situation, but where there is "no chance" of warping it to such a purpose, organized labor promptly obeys "that impulse."

Sounding the Slogan of Americanism

FEW men are given the opportunity to receive so wholehearted and unanimous an ovation from their associates or business competitors as was accorded Judge Gary at the semiannual meeting of the American Iron and Steel institute at New York last week. Both at the opening session of the day and at the banquet in the evening, the appearance of Judge Gary or some pertinent declaration on his part on several occasions was made the signal for an outburst of great and prolonged applause. This positive demonstration of approval of his position before the country on broad questions affecting the welfare of industry and brought to the front by the arbitrary demands of radical labor leaders, was

formally expressed by the assembled manufacturers in a resolution of unqualified indorsement. In that resolution the iron and steel industry of the country gave its fullest approval to the principle of the open shop and to that of collective bargaining such as shall not be restricted to a mere instrument for the promotion of unionism. There never has been any question as to where the iron and steel industry has stood upon these questions, but its straightforward enunciation of its position is important just now.

While the iron and steel industry in indorsing the course of the one who had acted as its spokesman was applauding a principle as Judge Gary himself modestly declared, the great tribute to the man and his leadership also was equally clear. Likewise apart from its peculiar trade significance, this action was a sincere appreciation of an exponent of true Americanism by a representative body of responsible citizens. The country at large and the steel industry especially is fortunate in these troubled times in possessing the quality of courage and of leadership of such a man as Judge Gary. Emphasis was laid upon this fact by the clear analysis of the domineering attitude of labor unionism, the sane and well-balanced opinion on incipient bolshevism in this country, and the stern remedy for all skulking enemies of law and order which he expressed in all his addresses.

The meeting of the American Iron and Steel institute was characterized by various unusual features and events which added, in an important way, to the history of that organization. It was honored by the presence of the king of Belgium and by other foreign dignitaries and leaders. In many respects it was probably the most remarkable meeting of its kind ever held by the institute. But the real service which it performed for the country under prevailing conditions was the clear, strong note of militant Americanism which it sounded against radicalism in all its vicious forms affecting both the peaceful relations of industry and the established institutions of the nation.

Peace Vital to Copper Market

ATTENTION frequently is called by copper producers to the effect on the copper market of the delay in the ratification of the peace treaty. They assert that inability to make satisfactory credit arrangements is delaying large purchases. Financial arrangements await until peace is promulgated.

At the international trade conference in Atlantic City last week it was said France would need 90,000 to 100,000 tons of copper in 1920, and Italy 15,000 tons, while Belgium will need large quantities of copper sheets. In addition, Germany and the smaller countries of Europe will need much copper. Germany alone imported an average of over 100,000 tons yearly for 10 years before the war. With exchange at present levels, the cost of American copper to the Germans now amounts to more than $1 a pound, as against 22 cents in New York.

Balanced against this potential demand, the copper producers have a large stock of refined copper, variously estimated at 500,000 tons or more. They are apparently carrying this metal for future demand, and are content to make sales against current production. Present copper prices, while considered moderate in comparison with market values of other commodities, seem based on the balance of current domestic consumption plus small export sales, against current output, and without regard to the large stock.

Non-Destructive Tests for Steel

DURING the past few years an increased amount of attention has been given to the subject of testing steel by methods which do not destroy the test pieces. Considerable progress has been made in utilizing magnetic methods in the study of the internal structure and mechanical condition of iron and steel, and a great amount of research work has been conducted to apply X-rays to the study of steel.

Well written papers, in which the present status of magnetic analysis and X-ray examination of steel is clearly outlined, were presented at the general meeting of the American Iron and Steel institute held in New York last week. It was shown that the work already done has furnished sufficient evidence that the magnetic and mechanical properties of steel strictly correspond. It seems that this warrants the conclusion that magnetic methods may be used to advantage in fundamental investigations and for nondestructive testing of steel products. The future development of magnetic testing probably will involve much study in an effort to properly interpret the results of analyses.

The study of steel by means of X-rays has not been perfected to the extent already attained in magnetic analysis. The rays, thus far, can only detect small inclusions and flaws, providing they are in the immediate neighborhood of the photographic plate and near the surface of the piece. Large imperfections near the center of large pieces must be detected by other means.

However, there is a wide field in modern industry for both methods and, as ably pointed out by Professor Howe, the X-ray may be considered as supplementary to magnetic analysis. The products of a mill can be tested magnetically, quickly and at little cost. The X-ray test, because it is slow and more expensive, should be used only on parts shown by other tests to be suspicious. In the case of steel to be used on products on which life depends, both tests should be used and every precaution taken to detect flaws.

Pig Iron Shortage Grows Acute

Melters Cast About in all Directions for Early Metal—Restricted Car Supply Complicating Factor—Liberal Sales for Next Year Made at Advanced Levels—Cleveland Interest Sells 100,000 Tons—Chicago Prices Again Raised

Chicago, Oct. 28.—After having been moved from $26.75 to $28.75, furnace, for foundry iron containing 1.75 to 2.25 silicon, the Chicago market has advanced a second time to $30, furnace, for that grade and to $30.50, furnace, for malleable. These figures applies only on first half, as northern furnaces are unable to take on further orders for the remainder of this year. The new bid is $3.25 higher than that which prevailed through most of the present year. Local makers find they have comparatively small tonnage remaining for first half and with production cut off to a great extent during the past five weeks and the future uncertain, it is difficult to estimate closely how much iron will be available for the first half. As a result only regular customers are being considered for that delivery. Stocks on furnace yards promise to be practically cleaned up within a short time as demand has made it possible to deliver off iron and misfit lots which ordinarily would not be considered. Demand for iron is heavy. One local seller has disposed of considerable iron from the valleys, the first sales having been at $26.75, furnace, but $28.75, furnace now is being obtained. Iron is also being shipped into this district from Birmingham, southern Ohio and the Soo. The latter and Birmingham iron are being delivered here on a practical equality as to price. One recent sale covered 3000 tons of foundry from a valley producer to two Chicago consumers. An important southern producer recently sold 4000 tons of foundry to a Chicago melter. Malleable is unusually scarce, and while foundries using this grade have not met with difficulty as yet, stocks are falling and unless larger delivery is made, some of them may find it necessary to curtail operation. A Wisconsin consumer is inquiring for 3500 tons of malleable for first half, and another melter 2000 tons of malleable for the same delivery. It is rumored currently in this market that a recent sale of malleable from southern Ohio covered 3000 tons at $31.25, furnace, a $4 over the Redfield schedule. A sale of between 5000 and 10,000 tons of foundry is said to have been made at $30, furnace, for 1.75 to 2.25 silicon. With the strike of furnace men at Jackson, O., still in force, the situation as to silveries continues strong. Recent sales of 500 tons and 1000 tons of Ohio silveries have been made at $45.25, furnace, for eight per cent. A Tennessee maker is quoting $45.25, furnace, for eight per cent for first half, and is out of the market for this year. The latter has a freight advantage of 40 cents over the Ohio district. Lake Superior charcoal iron for first half has been advanced to $33 and $34.25, furnace, for the base grade.

Demand for Foundry Iron is Strong

Boston, Oct. 27.—The demand for spot foundry iron which was strong a week ago, has increased, and prices may be said to be secondary in many transactions. Inquiries exceed the available supply and there is a tendency on the part of foundries to become scared over the possibility of running out of iron. Odd lots are being grabbed as fast as offered even though the manganese and silicon content is not what is desired. Greater activity has also been reported in 1920 business. The weak spot in 1920 delivery has disappeared and while sales continue to be made at as much as $2 under spot delivery prices, this is because of the excessive prices in spot rather than a softening in future. A Buffalo furnace sold 1000 tons of 2X eastern (2.25 to 2.75 silicon) to a Massachusetts machinery manufacturer at $32 at the furnace for first half delivery. An eastern Pennsylvania furnace sold 500 tons of 2X eastern for first half delivery at $33 at the furnace. Sales for immediate delivery have been reported as high as $35 at eastern Pennsylvania furnaces for high silicon iron. The General Electric Co. wants approximately 3000 tons for its two Massachusetts plants. More furnaces are reported as sold for this year and some are going out of blast for repairs. Among these latter is Crane Iron Works which is out for alterations and improvements. The amount of iron sold during the week through Boston dealers has not been large, partly because of the scarcity of iron. The estimated total is 7000 tons about evenly divided between 1920 and 1919 business.

Sales Dwindle, Prices Advance

New York, Oct. 27.—It is becoming more difficult to obtain pig iron in this district, since practically all eastern furnaces are sold up for the remainder of the year. The amount of business during the past week was not nearly as large as in recent weeks. While pig iron is scarce, no instances have been reported in this territory where foundries have been forced to curtail operations due to lack of metal. As a matter of fact, it has been possible to get enough to meet requirements, although in a good many cases it was necessary to go to some trouble to do so. To obtain prompt iron, consumers have had to pay increasing prices. Thus, several sales of 2.25 to 2.75 silicon foundry for prompt

shipment have been made during the past week at $33, western Pennsylvania furnace, and the same grade has been sold at $33.25, Buffalo. A fair tonnage of Buffalo foundry, containing 2.75 to 3.25 silicon, has been sold during the past week at $35, Buffalo. Most makers continue out of the market on deliveries for next year. Some central Pennsylvania foundry for first quarter has been sold at $33, furnace, for 2.25 to 2.75 silicon. One of the few exceptions to the generally sold-up condition is in the case of Virginia iron, but even in that district there is very little iron to be had. One furnace, which recently was selling 2.25 to 2.75 silicon at $30, furnace, has advanced its price to $32, furnace, and has sold some tonnage. This interest also has sold some 1.75 to 2.25 silicon at $31, furnace. It is understood that some 2.25 to 2.75 silicon iron for this year has been sold at $33 and $34, Virginia furnace, but this is not verified. Fancy prices are being done on such Virginia high-silicon still available. One eastern Pennsylvania maker, in reply to an inquiry for first quarter, has asked $35, furnace, on 2.25 to 2.75 silicon, and $34, on 1.75 to 2.25 silicon. Considerable charcoal iron has been sold in this district for first half but offers have been withdrawn. Export business is developing slowly. One lot of 1000 tons of foundry was closed by a Japanese buyer after several postponements, and the buyer had to pay $1.25 per ton higher than he originally was asked.

Foundry Grades Jump in Price

Pittsburgh, Oct. 28.—Insistent demand and a shortage in the supply are finding reflection in a constantly upward tendency in prices of foundry and malleable grades of pig iron. In the past week 1000 tons of No. 2 grade was taken by a Pittsburgh district consumer at $29, valley furnace, while 500 tons of the same grade went to a Johnstown, Pa., radiator company, at the same price from another valley furnace, both sales were for delivery this year. Practically every merchant producer serving this district on foundry iron is sold out for this year and it is extremely doubtful if a price of less than $30, furnace, would be accepted on sizable tonnages for shipment up to Jan. 1. That, at any rate, now is the asking price of the interest who has not withdrawn from the market, and single cars continue to move at substantial premiums over that figure. One furnace interest, which had accumulated some inquiiries for first half recently opened its books and sold a round tonnage of valley iron on the basis of $28.75, furnace, for 1.75 to 2.25 silicon, and $30, furnace, for 2.25 to 2.75 silicon. This company then withdrew from the market. Generally, there is marked aversion to taking on 1920 business until a clearer line is to be had on cost but most interests are willing to accept reservations from regular customers on first half requirements and to make contracts providing for the naming of the price at a later date. Sales aggregating approximately 7000 tons of malleable are reported by a valley merchant interest at from $27.25 to $28.75. The bulk of these purchases was to Michigan and other Middle Western points for delivery this year.

Sell More Iron at Increased Price

Buffalo, Oct. 28.—More sales have been made by the Buffalo iron interest which last week quoted current delivery iron at the new price levels of $31 to $34 for foundry grades. Good tonnages have been sold at these figures. Another interest which has not been affected by the strike retired from the market for 1919 iron during the past week after selling several thousand tons. This interest obtained $31 for iron of 2.75 to 3.25 per cent silicon; $30 for 2.25 to 2.75 silicon, and $29 for 1.75 to 2.25 silicon.

A prominent consumer in this territory has closed for 10,000 tons of malleable for first half at $29.50 Buffalo, representing an advance of $2.25 over the former price.

Foundry Sales Are Heavy

Cleveland, Oct. 28.—The scarcity of pig iron is growing steadily and sellers are having much difficulty to find the metal to meet the new demands for early delivery. This situation is being complicated by the continued ban placed by the railroad administration on the use of open-top cars, exclusive of certain types, except for the coal traffic. Consequently the furnaces are having more trouble to load iron and are resorting to the use of some box cars. Some little valley iron is available for this year at $30 furnace, for 1.75 to 2.25 silicon and southern Ohio iron for early shipment continues to be sold in this territory at $29.75 furnace, or $32.15 delivered, for the same grade. Heavy sales of first half iron, particularly foundry, have been made by prominent producers on the basis of $28.75 furnace, for 1.75 to 2.25, and $30 furnace, for 2.25 to 2.75 silicon, and a round tonnage of this has been from valley furnaces. The total sales by one leading producer comprising principally first half iron and closed largely during the past two weeks are about 100,000 tons. This interest now has withdrawn from the market. Many of these sales have represented inquiries which have been accumulating for some weeks pending the opening of furnace books for delivery after Jan. 1. Some makers still are holding back on accepting orders for that period and one of them reports an aggregate inquiry for that delivery now on hand of 32,000 tons, the bulk of it foundry grades and in lots from 100 to 2500 tons. First half inquiry generally for foundry iron is active. No transactions in basic are reported but some of the valley steelmakers who are under contract have been endeavoring to increase these tonnages. Only two blast furnaces continue active in Cleveland, which is the same as a week ago.

Shortage Becoming Acute

Philadelphia, Oct. 28.—The scarcity of pig iron has reached such an acute stage that some consumers will have to shutdown soon for lack of metal. It constantly is becoming more difficult to locate iron and although the furnaces in some cases are diverting iron from plants which have adequate stocks, they are unable entirely to relieve the situation in this way. Fancy prices are being paid in some cases for such iron as is to be had and this particularly is true of high silicon. No. 2X (2.25 to 2.75 silicon) for prompt shipment has been sold during the past few days at $33 eastern Pennsylvania, $34 Buffalo, $33 central Pennsylvania, $32 Virginia and $31 Pittsburgh. Buyers are reaching out in all directions for iron and attempts now are being made to locate tonnage in the district west for eastern users. No. 1X (2.75 to 3.25 silicon) has sold at $35 eastern Pennsylvania and $37 Buffalo. Some of the prices noted are exceptional and the regular market for this year still may be quoted at $32 to $33 eastern Pennsylvania furnace for No. 2X. All usual eastern sources now are sold up for this year, excepting Virginia and comparatively little Virginia iron is left. A Virginia company which was selling some high silicon and manganese iron has withdrawn from the market. Another Virginia maker who recently has been restricting sales to No. 2X now is oversold on this grade and is selling some No. 2 plain (1.75 to 2.25 silicon) for delivery in 30 to 60 days at $31 furnace. Another Virginia maker has a price of $30 furnace on No. 2 plain with regular differentials but has no No. 2 plain and very little No. 2X. It is selling mainly No. 1X and higher silicon. There is a little more interest in selling iron for first half. One eastern Pennsylvania furnace sold some first half No. 2X at $32 furnace. Another is asking $35 furnace for No. 2X for first half. The most interesting development, however, is the fact that a valley furnace is soliciting business here at $30.75 valley for No. 2 plain with regular differential for first half. Its freight rate here is $4.40. Several eastern consumers urgently want malleable but cannot get this grade. About 1500 tons of basic has been bought by a leading eastern consumer at around $28 delivered. Eastern users have bought 2000 tons of copper-bearing low phosphorus at $35. furnace and several hundred of standard iron have been sold at $37 eastern furnace.

Offer More Iron for 1920

Cincinnati, Oct. 27.—Both northern and southern furnaces are now more willing to take business for next year, although only one maker in the South has opened his books. This producer is taking business on a basis of $29, for 1.75 to 2.25 silicon, Birmingham, for first quarter shipment. A southern Ohio interest has been booking orders for either the first quarter or first half at $29, Ironton, and another large producer in the same district has set $29.75 as his minimum for that delivery. Malleable is very firm, but no new sales are reported as consumers have about filled their requirements for the next few months.

Demand for Basic Increases

St. Louis, Oct. 25.—Demand for all grades of pig iron is urgent and a large tonnage, made up of relatively small lots, has been sold. The largest lot for immediate delivery reported during the week was 1200 tons. Consumers, especially the iron foundries, have all the business they can handle, and in a number of cases new orders have been turned down

because of lack of capacity and inability to secure raw materials. Selling agencies report excellent inquiries, mainly for prompt shipment, though they have had numerous inquiries for iron for the first quarter. Selling into 1920 has been on an unusually small scale.

The National Enameling & Stamping Co. is reported to have purchased 25,000 tons of basic at Chicago for first quarter at $25.75, furnace. In addition this corporation recently has taken 6000 to 8000 tons for this year, the reported price being $25.75, southern Ohio furnace.

Southern Iron Selling Into 1920

Birmingham, Ala., Oct. 28.—Pig iron sales are being made by southern producers for 1920 delivery on a basis of $29 for No. 2 foundry (1.75 to 2.25 silicon), $30.15 for No. 1 foundry (2.25 to 2.75 silicon) and $31.40 for 2.75 to 3.25 silicon. Some of the furnace companies are out of the market, either on spot or 1920 iron, for the reason that the probable make for this year practically has been sold. Numerous orders are being received for 1920 delivery, and negotiations are under way for a large tonnage.

Ore Movement

Slowing Up—Season's Shipments to Approximate 48,000,000 Tons

Cleveland, Oct. 29.—The ore movement has slowed up perceptibly due principally to the inability of furnaces to take shipments, and in some instances to a shortage of cars. There is no market for ore at present, although one of the leading operators could place 60,000 more tons if it had the dock facilities for handling the ore until it could obtain cars for shipment to the furnace interest seeking the tonnage.

Little hope is now entertained for renewed activity in shipping before the close of the navigation season. Reports received by ore operators indicate that ore storage yards at furnaces are well filled up. This accounts in a measure for the fact that while more furnaces are going into blast they are unable to accept more ore at present. Some furnaces have the labor to unload the ore, but will have no place to put it until consumption has reduced stockpiles. One ore company reports that the interests which it serves have so far resumed production that they are able to take shipments up to the full extent of available cars.

Total shipments from the Lake Superior district for this season will be 20 per cent less than shipments in 1918. Shipments for the first 23 days of October, 1919, amounted to 4,765,000, and on a basis of current shipments the month's total will approximate 6,000,000 tons. It is estimated that the balance of the season's shipments will bring the total up to 48,000,000, approximately 13,000,000 tons less than the combined shipments of last year.

Vessel tonnage to move 1,000,000 tons of ore in 1920 from the Lake Superior district to Lake Erie ports already has been contracted for.

Strike Call Sends Up Coke

Prospect of Walkout of Coal Miners Makes Market Erratic—General Asking Price is $5.50—Foundry Coke Also Advances

Pittsburgh, Oct. 28.—Illustrative of the condition of the market for furnace coke, sales in the past few days have ranged from $4.75 to $6, ovens. The higher price represents purchases made by eastern interests, who, alarmed by the possibility of a tie-up of the soft coal mines, next Saturday, have made price a secondary consideration. That price also has been paid for about 4000 tons for export. On the other hand, a sale of 25 cars of standard furnace coke was made about four days ago at $4.75 and this week $5.25, ovens, appears to be as high as any of the furnaces have been obliged to pay on direct busness. The market today is quotable on direct sales from $5 to $5.25, with the general asking price of the oven operators, $5.50, ovens. The possiblity that the strike of the coal miners will not occur on Saturday has been strengthened by the President's message to the coal miners' union officials and inquiries this week have tapered down considerably. The situation, however, remains extremely uncertain and even though the strike order may be rescinded, it is possible there may be some dislocation of production due to the fact that miners in some parts of the country will go out Saturday. Although output of the beehive ovens recently showed a substantial gain, shipments against contracts absorb the increase and it is stated that the regions are bare of surplus supplies. It is reported that a round tonnage is on the market at $6 and the word from Connellsville today was that the car supply on the Monongahela division for tomorrow would be only 20 per cent as compared with 100 per cent during the past few weeks. Foundry coke also has been bringing better prices recently than it commanded a week or 10 days ago. Numerous small sales for immediate shipment are reported at $7, ovens, and $6.50, ovens, appears to be the minimum on brands of high reputation. The production of coke from the Connellsville region for the week ended Oct. 18, is estimated by *The Connellsville Courier* to have been 204,445, as compared with 153,764 tons in the previous week.

New England Placing Large Orders

Boston, Oct. 27.—As a result of the threatened coal strike foundries are placing heavy orders for coke. The Providence by-product producer which reported some weeks ago that it was sold up for this year now states that its product for first quarter also has been taken. Many of the large consumers have placed good orders during the week. A textile machinery manufacturer has purchased nearly all of its first-half requirements. Another concern has ordered a car a day in addition to the amount covered by its regular contract. All of the dealers report heavier spot orders taken than have been placed in many weeks. The price remains the same at $10.90 for this year and $11.90 for next, although it is expected that spot delivery prices will be raised the first of the month.

Spot Demand Pushes Up Price

New York, Oct. 27.—Due to the threat of the coal miners to strike Nov. 1, there has been a large demand for coke from consumers in this district. The spot demand has served to push up prices about 50 cents a ton. Standard beehive foundry coke for spot shipment now is held at $6.25 to $7, Connellsville. Demand for by-product foundry coke also is good, but prices are unchanged in this district. The northern New Jersey by-product maker continues to ask $6, Connellsville, or $9.10, delivered at Newark and other New Jersey points for this year, and $6.50, Connellsville, for next year. Some export business is being done.

Prices Advanced in All Districts

Cincinnati, Oct. 27.—Coke prices have advanced sharply in all districts. It is reported that some spot foundry coke in the Connellsville field recently brought $9, ovens, but the contract figures range from $6.50 to $7. Most coke producers are unwilling to take on much future business, and practically all contracts are so worded to protect producers in case coal should be advanced. Wise county oven operators have practically withdrawn from the market, except for such fuel as they can offer for November-December shipment. The same condition exists in the New River field, where practically no furnace or foundry coke is to be obtained.

Prices Advanced at St. Louis

St. Louis, Oct. 25.—An advance of about 50 cents on all grades of coke was recorded in the market here during the week. This restores the quotations obtaining here immediately prior to the steel strike. Banking of furnaces in the strike areas released a quantity of coke, which was placed at small concessions in this district, but now the furnaces are again operating. Connellsville 72-hour foundry is bringing from $6 to $6.75, ovens, for reasonably prompt shipment, and subject to car supply. The demand is described as active to urgent, and all industries are eagerly taking everything arriving. Many are seeking to stock up. Inquiries range from 300 to 1500 tons, and several orders have been refused because of inability to secure the desired tonnages at the ovens. The West and Southwest, which for a time were out of this market, are now figuring prominently in inquiries. This is explained by the fact that the South, which offers an attractive freight differential to many western and southwestern points is unable to furnish coke in the quantities desired. There has been some contracting into 1920, but less than usual.

Scrap Prices Moving Up

Foundry Grades Make the Best Showing—Some Steel Sold Higher in East—More Life Generally Shown

FOR COMPLETE SCRAP PRICES SEE PAGE 1226

Chicago, Oct. 28.—Considerably greater activity is present in the scrap iron and steel market at Chicago, and prices are moving upward most decidedly. Resumption by steel mills is good and affords an outlet for heavy melting steel and allied grades, while demand for bar iron is causing activity in rolling mill material. Cast scrap and other material which can be used in the cupola are decidedly active and prices are above the local quotation for pig iron. However, this figure is less than that asked for pig iron coming from outside sources and represents a medium course. The Chicago, Burlington & Quincy offers 4400 tons of scrap included in which is 600 tons of steel rails, the Chicago, Indianapolis & Louisville 700 tons of No. 1 steel rail and 40 tons of No. 2 steel rail, and the Chicago, Milwaukee & St. Paul 700 tons of assorted scrap.

Machinery Scrap Sells Readily

Boston, Oct. 27.—New England foundries continue to buy No. 1 machinery scrap almost as fast as it is offered, in fact it is often difficult to obtain this grade in as large lots as demanded. The price remains firm at $28 with occasional sales at $28.50 delivered to consumer. Inquiries in Boston from foundries at a considerable distance from Boston scrap yards, have been reported in unusual numbers. These have come from Vermont, Maine, and Connecticut and in the majority of cases have resulted in orders. Scrap dealers however point out that their principal business is in heavy melting and other grades used by steel makers and that in these lines the market is decidedly quiet. New England during the past month has been the source of great quantities of war department scrap and offerings are being made from the local ordnance office almost daily. Recent proposals cover 135 tons of round steel bars, smaller quantities of steel projectiles, steel edgings for helmets, and of complete 75-millimeter steel shells, also about 140 tons of malleable cast heads for trench mortar shells. The New England Bolt Co. was awarded 135 tons of bessemer screw stock at $1.61 per 100 pounds f.o.b. Orange, Mass.

Foundry Grades Are in Demand

Pittsburgh, Oct. 28.—Although the possibility of a coal strike Nov. 1 makes for conservatism in the matter of new purchases of scrap by the steel manufacturers, it is noted that practically all of them are issuing permits for the shipment of material due them on contracts. A Pittsburgh steel company, whose plant has been idle since early in the year for rebuilding, recently bought a round tonnage of heavy melting steel, for which it paid $21, delivered. This sale and the shipments on permits constitutes all of the recent business in steel plant scrap. Foundry scrap, however, has been in strong demand presumably because of the recent inability of the foundries to secure full shipments of pig iron against contracts and the lack of spot supplies of the latter except at substantial advances. No. 1 cupola cast has found a ready sale at $25 to $26, delivered, and on small tonnages even more has been obtained. It is doubtful if any of this grade could be bought today under $26, as dealers have been combing the country for supplies and have offered as much as $25. Railroad malleable also is in strong demand, and sells readily at full quotations. The Pennsylvania railroad, lines east, is offering 26,200 gross tons of scrap in its November list, the largest items of which are 3500 gross tons of No. 1 steel rails, 2200 gross tons of miscellaneous rails, 2000 gross tons of No. 1 heavy melting steel, 1800 gross tons of No. 2 railroad wrought, 1500 gross tons of destroyed steel cars, 1200 gross tons of couplers and knuckles and 1000 gross tons of No. 2 uncut structural and bridge steel.

Prices Advanced in New York

New York, Oct. 27.—Demand for borings and turnings and heavy melting steel continues. Eastern Pennsylvania consumers are covering on sizeable tonnages, and prices are tending upward. No change, however, has been made in heavy melting steel, quoted at $15.50 to $16, f.o.b. New York. Prices of clean cast borings have advanced to $14 and $14.50, and machine shop turnings to $11.50 and $12. On all other descriptions quotations are unchanged.

Eastern Market Shows Strength

Philadelphia, Oct. 28.—The scrap market in this district shows great strength. There has been some business in heavy melting steel at higher prices, and there would be more if it were not for the fact that dealers will not accept prices offered. There has been considerable buying of machine-shop turnings by blast furnaces, rolling mills and steel works, and also considerable buying of borings by rolling mills and steel works. Forge and bundled sheets are in demand for the charcoal iron industry. Demand for cast scrap is good.

Shipments Now Going Forward

Buffalo, Oct. 28.—Dealers are looking for a brisk market in scrap when steel mills operate on a normal basis. There is more life to the market today than there has been at any time since the strike began. Scrap is scarce, due perhaps to the fact that dealers may be holding back tonnages expecting higher prices, now that pig iron is on the rise. Shipments that were held up when the strike started are now going forward to mills outside the district. Heavy melting steel, turnings, borings, malleable and cast are in demand. There are no changes in prices.

Hold Scrap for Higher Prices

Cleveland, Oct. 29.—While signs of a better market for scrap iron and steel are unmistakable, the average dealer in this market is not optimistic. Mills in the valley are increasing operations, while cast and malleable continue in good demand in the Cleveland district proper. However, one of the largest consumers of turnings and melting steel is out of the market for the remainder of the year. Practically no cars are available for scrap. One dealer offers $20 for melting steel, and has been unable to get it. A bid of $11.60 for turnings proved too low. A Cleveland dealer, bidding on scrap produced by a Detroit interest, offered $11.10 for borings, $9.60 for turnings, $15.10 for short flashings and $15 for hydraulic compressed, and was too low on every item. The freight rate on scrap from Detroit is $2.40. Yards are holding their scrap, and are refusing offers slightly above published quotations.

Cars Lacking; Movement is Slow

Cincinnati, Oct. 27.—Urgent demand for gondola cars for coal has made it impossible for dealers to obtain the cars for scrap. Embargoes against Pittsburgh also are still in effect, and little scrap of any kind is moving. Local foundries are buying small quantities for delivery by truck. Dealers are buying scrap sparingly, and purchases made out of the city are to be held by the sellers until cars can be secured. The Portsmouth plant of the Whittaker-Glessner Co., is again in operation and the Andrews Steel Co., and Newport Rolling Mill Co., expect to start their plants Nov. 3. These will afford an outlet for considerable mill scrap. All prices are nominal, as transactions are too few on which to base definite values.

Rerolling Grades in Demand

St. Louis, Oct. 25. Orders and inquiries for scrap have been confined mostly to car lots or small tonnages for immediate use, although a few round tonnages are reported to have changed hands. The principal element of strength in the market is the limited supply. Virtually nothing is coming into this market. No railroad lists were out during the week, and the movement from the country is almost at a standstill. Among dealers and yard interests the opinion is general that when the steel strike is settled there will be a boom period. In this district, rolling mills are deluged with orders, and rerollers are in particularly strong demand, with few offered and the price advancing daily. Quotations have advanced to from $28 to $28.50. The leading local interest using rerolling rails is not in the market, but there are strong inquiries from Moline, Monroe, Chicago and Ohio. Relaying rails are also in demand, the inquiry coming principally from the

oil fields of the Southwest. Iron foundries continue busy and all grades suitable are firm. Steel mill grades are showing more activity.

More Activity in South

Birmingham, Ala., Oct. 28.—There is a little more activity in the southern scrap market, and if the threatened coal strike does not disturb the iron and steel industry considerable business will be noted before long. Heavy melting steel is not moving fast, as the dealers are holding for higher prices than consumers offer. Cast and stove plate are doing well, while the low grades, machine-shop turnings and cast-iron borings, also are in demand. Quotations have changed a little. Wrought, axles, rails and wheels are not much in demand. A little country scrap is coming in.

No Selling

In Wire Products Except Fence Wire —Export Demand Heavy

Pittsburgh, Oct. 28.—All makers of wire and wire products are out of the market as far as new business is concerned, except for fence wire, on which line they are accepting specifications from regular customers. The company here which recently had a moderate amount of barbed wire and galvanized wire in the heavier gages available for prompt shipment has become sold up and has withdrawn. Producers whose plants were suspended or crippled by the strike and which since have resumed, report steady gains both in operations and in production. Export demands for wire products, especially nails, continue heavy but are placed with extreme difficulty owing to the lack of surplus tonnage over the contract obligations of producers. The lower quotations on wire products now find basis only on shipments against orders placed some time ago.

Better Production Seen

Chicago, Oct. 28.—Conditions in the wire market have undergone no essential change during the past fortnight, but a gradual increase in production has taken place with consequent slightly increased shipments. This has not been sufficient however, to take the edge off the desire of consumers to receive more wire and nails. With production much curtailed and a large order book, selling is at a minimum.

Warehouse Prices to Go Up

New York, Oct. 27.—Although quotations in the local warehouse market remain unchanged, an advance in some descriptions is likely in the near future. The difficult position of the mills continues to be reflected by a good demand for practically all materials, and sheets appear especially strong. The strike situation has improved considerably, but so heavily are the majority of mills booked, that nearby deliveries are difficult to obtain, and consequently consumers are relying on warehouses. This is particularly true in regard to structurals.

Sheet Prices Are Higher

Limited Tonnage of Valley Material Available Moving at Several Dollars Advance—Supplies Scarce—Operations Steadily Improve

Youngstown, O., Oct. 28.—Sheet production at Mahoning valley mills continues low. Only two plants are running and at one of these operation is on a small scale. Makers are doing their best to look after their regular customers but conditions are beyond their control. It is not a question of price since a large tonnage of black sheets could have been sold at 4.75c last week by one maker, but one of demand due to the shortage of various grades.

Spot business is at a standstill. Any surplus, which in the past might have been piled on mill floors, has disappeared and it is questioned whether an appreciable amount of sheets remain in stock at any mill in this district. Any buyer will find it extremely difficult to get on the books for any reasonable amount for this or next months' delivery. He stands a fair chance, if well known, however, of getting a shipping date in December. Stocks perhaps never were as low nor rolling schedules so congested at valley mills as they are now. Buyers requiring No. 27 gage or lighter find it impossible to place orders, since mill books are occupied with more attractive rollings. The present demand, 14 to 20 gage, would be ample to keep the mills rolling for several weeks.

When mill books are thrown open again it is thought higher prices will prevail. At present all grades are commanding from $4 to $6 per ton more than last week's quotations, not only in the Mahoning valley but in nearby territories. The reason for this sudden increase is attributed to raw material conditions. Steelmakers are obliged to pay higher prices for scrap. Consumers of sheet bars are paying $45 and they show no surprise at the mention of $50 bars by 1920. With spelter around 7.60c galvanized makers state they cannot afford to make coated sheets at 5.70c. Any tonnages that can be had here now, are quoted as follows: Blue annealed, 3.65c to 3.75c; black, 4.40c to 4.60c; galvanized, 5.80c to 6.00c; and mill warmers, $22 to $25 per ton.

Operations Still Are Gaining

Pittsburgh, Oct. 28.—The American Sheet & Tin Plate Co., this week is operating more than 85 per cent of its sheet mills, while independents are running close to 60 per cent of their capacity. Approximately 80 per cent of the latter's mills which were in operation on the day of the steel strike are now operating. Some of the independent companies are none too well off in the matter of supplies of sheet bars but none of them has been obliged to suspend because of inability to secure semifinished steel. Production is larger at practically all plants, but deliveries are somewhat hampered at a number of them because of the shortage of common labor. Numerous demands are coming out for practically all kinds of sheets from consumers whose regular sources of supply are unable to make full shipments. Such inquiries get practically no attention as current production is 100 per cent pledged on contracts. The American Sheet & Tin Plate Co., has not yet opened its books for first quarter and first half of 1920 business, and the independent companies are waiting for that interest to take the first step in this direction.

Eastern Demand is Good

Philadelphia, Oct. 28.—Demand for sheets is good, but as many mills are idle few can take orders. The leading eastern maker continues shut down because of labor trouble. One consumer has bought two cars of galvanized sheets from a mill now active at $6.20, Pittsburgh base, which is premium of 50 cents per 100 pounds.

Small Supplies

Of Semifinished Steel Bring Higher Prices—Sheet Bars Scarce

Pittsburgh, Oct. 28.—Demands for sheet bars still are large and urgent, but actual sales are small due to the fact that leading producers in this district have no surplus beyond their own requirements and their contract obligations. One of the Pittsburgh steel companies which took about 4500 tons of sheet bars this week now has no surplus steel to market in this or any other form. Several of the makers of sheets and tin plate are in need of sheet bars owing to the fact that their regular sources of supply are crippled, if not entirely shut off. No trouble would be experienced, it is declared, in obtaining substantial premiums over the March 21 base of $42 from these buyers. Fair demand is noted for billets which are not so scarce as sheet bars, and while sales are reported as high as $40.50, business at premiums is not large. Open market demands for slabs are few and moderate, but makers of wire rods who have surplus tonnage have little trouble in disposing of it. Sale of 300 tons of soft wire rods are noted to a domestic consumer at $60.

Strip Production Rises

Pittsburgh, Oct. 28.—Some of the makers of strip steel in the district which was adversely affected by the walk-out of Sept. 22 gradually are increasing operations. General production is larger now than it has been since the strike started. The heaviest bookings come from the builders of automobiles and tractors and they are pressing for deliveries of material on these agreements.

The Cleveland-Akron Bag Co., Cleveland, will build a $1,000,000 factory at St. Joseph, Mo.

Can't Meet Bar Demands

Production Falls Behind Contract Obligations and Little New Selling is Done—Specifications Filed Promptly—Bar Iron Strong

Chicago, Oct. 28.—Inquiry for soft steel bars is on the increase as to number of inquirers, but most lots are small and practically everything is for prompt delivery. Mills cannot promise delivery and can only agree to roll the material within a certain period after the labor situation has allowed a return to normal conditions. At the same time mill operation is such that a fair tonnage is being produced and sent forward to consumers. Practically all users have come to the conclusion that specifications should be filed promptly to assure a favorable position on mill books.

Manufacturers of bar iron are booking business on an enlarged scale, largely dictated by inability to obtain soft steel bars. Railroads still are backward about placing orders and without this assistance, mills have not been able to accumulate a backlog, although the excess of orders over deliveries is gaining. The quotation is steady at 2.72c, Chicago mill.

Manufacturers of hard steel bars rerolled from rails are quoted at 2.65c, mill, and under the present circumstances of a heavy demand for bars and a light supply of rerolling rails, they have been forced to turn down about as much inquiry as they have been able to accept. The rule seems to be to take care first of regular trade, and let others seek their supplies elsewhere.

Production Still Behind Demand

Pittsburgh, Oct. 28.—Although more bar mills are in operation this week than before since the outbreak of the strike, production still is far behind contract obligations and new demands are almost impossible to fill except out of warehouse stocks and these have become pretty much depleted as the result of the recent demand. A few of the important companies have withdrawn all their quotations on bars until it is definitely known whether there will be a strike of the coal miners on Saturday. The Carnegie Steel Co. is holding at the March 21 base of 2.35, base Pittsburgh, and under present conditions this price refers only to shipments against old obligations. Buyers in need of smaller sizes of rounds for immediate shipment probably would have to pay substantial premiums. A shortage of iron bars for prompt delivery also is indicated. Makers of iron bars not only are getting good demand from regular sources but also are disposing of fair sized tonnages to take the place of soft steel bars. Iron bars are firm at 2.75c, Pittsburgh, for common merchant iron and at 3.00c for railroad.

Eastern Prices Tending Upward

New York, Oct. 28.—Quotations in the eastern bar iron market are tending upward, notwithstanding the fact that the market is dull. At least 25 per cent of the offerings appear to be made at the level of 2.75c, Pittsburgh. These higher offerings are due largely to operating costs. Export demand, which was in some evidence several weeks ago, has disappeared, and domestic buying is quiet.

Get Bars for Bolts

Chicago, Oct. 28.—Better deliveries of raw material for the manufacture of nuts and bolts have allowed some mills to reopen after being closed because of lack of iron and steel bars. This change has come about through the better production by steel mills affected by the strike, and in some measure gives an indication of increased operation now possible. Demand for bolts and nuts is excellent and mills have all the business they can accommodate.

New Orders Are Liberal

Pittsburgh, Oct. 28.—Makers of cold finished steel bars had a big volume of business before them and a number of new orders are coming along because of the inability of manufacturers in other districts to supply more contracts. Some of the non-integrated makers are suffering from the shortage of merchant steel bars, but shipments of the latter are somewhat better this week than they were recently, due to the fact that more merchant mills are in operation this week than before the strike began. The market on cold finished bars is firm at 3.60c base Pittsburgh.

Orders Are Piling Up

Pittsburgh, Oct. 28.—As operations of the hoop and band mills still are considerably below normal, production is falling behind specifications and a considerable amount of business is backing up. Few of the makers had any reserve tonnages when the labor trouble broke out and in trying to satisfy demands against old orders, they have practically no tonnage available for new demands. The situation in cotton ties is just the reverse of that in hoops and bands, as sufficient ties were rolled to meet the requirements of a much larger cotton crop than actually will be produced this year.

Tin Plate Sales

Made at $7 for Domestic, and $7.50 for Export Delivery in January

Pittsburgh, Oct. 28.—One of the Pittsburgh producers of tin plate which was not very heavily committed for December rollings is taking a limited amount of business for delivery in January at $7 per base box, Pittsburgh, for domestic accounts, and $7.50, Pittsburgh, on export orders. As a general rule makers of tin plate are committed at least to the end of this year and probably a little longer due to the dislocation of production and shipments resulting from the steel strike. Heavy export demands are noted and domestic consumers would be larger buyers if the tonnage was available. Production is gaining steadily as the American Sheet & Tin Plate Co. now has 60 per cent of its capacity in operation, and recent gains by the independents are being well maintained.

Limited Buying

Being Done in Ferroalloys—English Manganese at $100 Seaboard

Pittsburgh, Oct. 28.—A sale of 150 tons of ferromanganese constitutes the largest recent individual transaction in this market. This tonnage went to a Pittsburgh steel foundry. The material was imported, and the price was $100 c.i.f. Baltimore. All other demands have been small and comparatively few have resulted in sales. Domestic producers generally are holding 78 to 82 per cent material at $110, delivered, but it is intimated that they have shaded this price a few dollars. It is believed that a firm bid of $107.50, delivered, would not be refused by domestic producers. No demands of any consequence are noted for spiegeleisen in this market and only carload lots of 50 per cent ferrosilicon are being sought, and these in all cases are for immediate delivery. While a number of producers of the latter material are quoting $85 or higher, the more general basis of sales is around $80, delivered, Pittsburgh.

Not much interest is being taken in the lower grades of electrolytic ferrosilicon nor in that produced in blast furnaces. Production of bessemer ferrosilicon, however, is moderate and supplies are not such as to lead makers to sacrifice prices to stimulate demand. Domestic producers of ferrochrome have fairly strong price ideas, some of them quoting as high as 30 cents, while 25½ cents seems to be the minimum named recently by domestic producers. Quotations of 22 cents to 24 cents on this material are believed to refer to imported stock.

Will Pay $103 Seaboard

New York, Oct. 27.—Several consumers are said to be willing to buy English ferromanganese at $103, c.i.f. tidewater, but it appears that the metal is not obtainable at this figure, at least without first referring the bids to the English principals. Some English ferromanganese is offered at $105, c.i.f. but for shipment next year. The market on domestic metal still may be quoted at $110, delivered. One domestic maker is asking $115, delivered on ferromanganese for prompt shipment but has not yet sold at this figure.

Demand for spiegeleisen is quiet. The market still may be quoted at $33 to $35, furnace, for 18 to 22 per cent metal.

English Ferro is Reduced

Philadelphia, Oct. 28.—English makers recently reduced their domestic price on ferromanganese to a figure which considering exchange is equivalent to $100, tidewater. No offers

are being made here at present on English ferromanganese, however.

Pipe Advanced

By Foundries in East—Mill Sales Are Being Kept Down

New York, Oct. 27.—Prices have again advanced $2 in the eastern cast iron pipe market. Four-inch pipe is now $61.30, New York, and 6-inch and over, $58.30. These prices apply to class B pipe, while class A is $2 higher. The largest award during the past week involved 2000 tons for East Hartford, Conn., and went to the Warren Foundry & Machine Co. Public business has been negligible, and little of importance is in sight at the moment. Private buying continues to hold up well.

No Change in Situation

Pittsburgh, Oct. 28.—General conditions in the market for tubular goods are much as they have been during the past few weeks. Pittsburgh district manufacturers were less affected by the strike than those in other districts, but while they have not added to their obligations, the dislocation of production and distribution has much deferred the completion of the business they had on their books. The Jones & Laughlin Steel Co., has maintained normal operation of its pipe mills and the only plant of the National Tube Co., outside of that at Benwood, near Wheeling, W. Va., which was affected was the Pennsylvania works in this city. That plant now is running 50 per cent of capacity. Both these companies are making good shipments against contracts. The A. M. Byers Co., and Spang, Chalfant & Co., are recovering from the effects of the strike. A big shortage of all kinds of pipe is being built up because producers in the Wheeling district still are down, and Youngstown, O., manufacturers have not been able to increase production to substantial proportions.

Season Near End

Chicago, Oct. 28.—With weather suitable for excavation, laying of water mains almost at an end, inquiry and buying of cast iron pipe has almost disappeared. Occasional requests are received for carloads to be shipped promptly to fill out on jobs already under way, and in most cases delivery within 30 days is requested. Cities with contracts made earlier in the season are pressing for delivery and most shops are able to meet desires. While there is not sufficient backlog in most shops to assure operation through the winter, stocks have been drawn to a low point and it will be possible to operate for some time in replenishing these. Bids will be opened at Chadron, Neb., Nov. 3 on 1000 tons.

Offered Business for 1920

Birmingham, Ala., Oct. 28.—Cast-iron pipe plants in the Birmingham district are operating on full time with plenty of business in hand and more orders in sight. Business for 1920 is being offered.

Plates Feel Dock Strike

Heavy Export Deliveries are Held Up—Eastern Makers Sell at 2.65c Mill in West—Belgian Cars Call for 65,000 Tons

Philadelphia, Oct. 28.—The dock strike at New York is holding up the shipment of export plate orders and is having an embarrassing effect on eastern mills which have big backlog of foreign business. Domestic plate business reported as somewhat less active than any preceding week since the steel strike was called but is satisfactory. Among the leading eastern buyers at present are the Pennsylvania and Reading railroads which are taking good sized tonnages for car repairs, especially the former. The Chesapeake & Ohio has out an inquiry for a round tonnage of tank plates.

Export Plate Orders Plentiful

New York, Oct. 27.—Mills report that the majority of the plate orders which are offered here are from foreign sources, and chiefly from Japan. These are to be had at 2.65c, Pittsburgh, but the mills already are so well sold up that they do not care for this business, as a rule. There is some domestic demand for plates here but this demand is not as active as it has been of late in other sections of the country. At least one large lot has been let in this district during the past week, and another lot, 15,000 tons, is pending.

No Prompt Business Being Taken

Pittsburgh, Oct. 28.—One maker of plates in this district yesterday withdrew all quotations on plates because of the possibility of being unable to make shipments in the event of a strike by the coal miners. Little or no new business is being taken by makers here as they all became well sold up as a result of orders from consumers ordinarily served by other makers who were crippled by the steel strike. On all recent business 2.65c, Pittsburgh, has been obtained without any trouble, but no sales have been made at any higher price, although reports from the East have been to the effect that makers are getting as high as 2.75c, Pittsburgh.

Higher Prices Obtained

Cleveland, Oct. 28.—Plates are bringing higher prices in this territory and eastern mills are obtaining 2.65c mill, equivalent to 2.95c delivered Cleveland territory. Heretofore these makers have been equalizing the freight from Pittsburgh to this district, but now are adding the full freight from the mill. The Pittsburgh price of 2.65c is equivalent to 2.82c Cleveland.

Japs Take Small Lot

Chicago, Oct. 28.—The leading interest has booked 600 tons of plates for export to Japan for use by a shipbuilder, and a small lot of bars to be used in connection therewith. General plate demand is excellent and consumers feel it would be wise to place their specifications as early as possible to obtain position on rolling schedules. A Belgian inquiry for cars entails a requirement of 65,000 tons of steel chiefly plates.

No Rail Advance

Report Due to Misapprehension—Belgium Wants Many Cars

Pittsburgh, Oct. 28.—Recent rumors that the price of standard open hearth rails had been advanced to $49 Pittsburgh appear to be without foundation as the largest producer in this district still is holding at $47 and says that no attempt has been made to obtain any advance. The rail mills of the Edgar Thomson Works of the Carnegie Steel Co. resumed operations this week. As nothing has been heard recently relative to the rumored order for 200,000 tons of standard rails by the railroad administration, it is assumed that this business now will not go out until the railroads go back to private ownership. Good inquiries are in for light sections especially for export. The New York, New Haven & Hartford railway recently closed on 200 kegs of standard spikes and now is seeking 5000 kegs more. Outside of this business nothing important has been done in standard spikes. Sales of small spikes also are more moderate and makers have practically nothing available for this year.

Belgians Want 10,000 Cars

Chicago, Oct. 28.—An inquiry by the Belgian government for 10,000 four-wheel coal cars of 20-tons capacity is being entertained by builders in this country. This will require about 65,000 tons of plates, shapes and bars and 20,000 axles. It is understood one western builder is planning to send a representative to Belgium to assist in obtaining this contract. The Pullman Co. has taken a contract for 25 cars for the Arms Palace Horse Car Co. The American Car & Foundry Co. has taken orders for 280 tank cars for various users, 100 mine cars for the H. C. Frick Co. and 50 pit cars for the Holland Coal Co., Altoona, Pa. The Pennsylvania Tank Car Co. has taken orders for 424 tank cars for various users.

Railroads are figuring on their rail requirements for 1920, but are unable to get ahead with definiteness until their operating status after the first of the year has been decided more definitely. The western mill was started in operation this week after being down since the beginning of the present strike. Mills are full for the remainder of this year except for small emergency tonnages. Demand for light rails is increasing in spite of possibility of a strike, by miners. It is believed plans are being made for carrying forward extensive repairs during the period of idleness if the miners go out.

Large Jobs are Pending

10,000 and 7,000-Ton Hotels at Detroit and Cincinnati Up for Figures — New Awards of Fair Amount

Cleveland, Oct. 28.—Demand for structural shapes continues in fair volume in Ohio and some districts of Michigan, and fabricators report they have all the business they can handle at present. Standard shapes for smaller building enterprises especially are in good demand, while several large building projects in Cleveland, Cincinnati and Detroit are coming to a head, general contracts having been let. It is apparent that considerable business will be closed before the end of the season's building activities. One Cleveland engineering company is reported to have plans prepared for nearly 50 rubber factories in various cities in Ohio for different interests. While many of these enterprises are waiting to be financed in many instances the companies concerned are seeking to begin building operations before cold weather sets in. Strenuous efforts are being made by trade union leaders to unionize the Michigan fabricating shops, but thus far they have not succeeded in hampering output. The biggest jobs in sight are 10,000 tons for the Biltmore hotel, Detroit; 7000 tons for the Gibson hotel, Cincinnati, and 5000 tons for the General Motors Co., Saginaw, Mich.

New England Work Holding Up

Boston, Oct. 27.—Structural bookings are holding up despite the influence of the steel strike. A contract was let to the Stone & Webster Engineering Corp., for construction of a $2,000,000 office building for the First National Bank of Boston. Actual work on this structure will not start before spring, and the amount of steel required has not been announced, although it is estimated at 3000 tons. Other work let during the week includes a $250,000 concrete 7-story factory for the Ace High Chocolate Co., Boston, which will take approximately 125 tons of steel, and a $150,000 concrete factory for Ellis & Hussey, Haverhill, Mass. The Daynor Realty Co., Norwalk, Conn., is taking bids for a five-story concrete factory to cost $350,000. Bids are also being taken for a $200,000 apartment building, Cambridge, Mass., a $100,000 manufacturing building at Pawtucket, R. I., and a $200,000 school house at Newport, R. I.

Outlook Better in East

New York, Oct. 27.—Outstanding among awards in the eastern structural market is a lot of 5000 tons for a loft store building at Seventh avenue and Twenty-ninth street, this city, for the Regent Construction Co. This business went to the Hay Foundry & Iron Works, which also received a couple of other smaller contracts during the past few days for construction work on Manhattan. Another sizable contract noted in the East is one placed with the McClintic-Marshall Co. for a plant for the West Virginia Metal Products Co., Fairmont, W. Va., involving 1300 tons.

While the market in the East continues to be somewhat depressed by the steel strike, several good sized tonnages have come out of late and buying, as compared with the early part of the month, is improving. In fact, the effects of the labor trouble are more in evidence at the fabricating shops, where difficulty is being had in obtaining shipments from the mills. Virtually none of the eastern fabricating shops, however, is having labor trouble of its own. Prices on the general run of fabricated material have varied but little.

Volume is Slightly Smaller

Philadelphia, Oct. 28.—Eastern shape mills report the volume of business as slightly smaller than in preceding weeks, but it is still at a good rate. Fabricators who are taking good tonnages report they are bidding on an unusually large total of fabricated work. Many ship contracts are reported.

Prospective Business is Good

Pittsburgh, Oct. 28.—Although the steel fabricating interests in this district recently have made comparatively few important bookings, a large amount of business is reported as being in prospect and likely to be placed once the labor situation becomes more favorable. Operations of the fabricating shops are normal in this district, although in some instances slightly affected because of the inability of the makers of plain material to make full and prompt deliveries. Shape mills in this district are well provided with business as a result of demands from buyers who ordinarily secure supplies elsewhere.

Western Building Slack

Chicago, Oct. 28.—After a fairly active period, construction in the west has dwindled and much less is coming through than had been promised. The largest tonnage closed during the past week involves 2325 tons for the Winfield hotel, at Fort Worth, Tex., awarded to the Mosher Mfg. Co., Dallas, Tex., which will obtain the steel from the Bethlehem Steel Co. The Iowa State university has let a contract for a cattle barn at Des Moines, involving 525 tons, to a local contractor, who has not announced the source of his steel. Plain material prices are unchanged at 2.45c, Pittsburgh, and 2.72c, Chicago.

CONTRACTS AWARDED

Power house for Philadelphia Electric Co., 500 tons, to the Phoenix Bridge Co.

Plant for West Virginia Metal Products Co., Fairmont, W. Va., 1300 tons, to McClintic-Marshall Co.

Addition to office building, Broadway and Leonard streets, New York, 200 tons, to Hay Foundry & Iron Works.

Addition to building of United Dressed Beef Co., Forty-third street and First avenue, New York, 300 tons, to Hay Foundry & Iron Works.

Winfield hotel, Fort Worth, Tex., 2325 tons, to Mosher Mfg. Co., Dallas, Tex.

Column shafts and cast bases for building for the Fulton Market Cold Storage Co., Chicago, 749 tons, to Lackawanna Bridge Co.

Extension to the plant of the General Electric Co., Erie, Pa., 700 tons to the Jones & Laughlin Steel Co.

Merchant bar mill building, Interstate Iron & Steel Co., Chicago, 800 tons to the McClintic-Marshall Co.

Loft store building for Regent Construction Co., Seventh avenue and Twenty-ninth street, New York City, 5000 tons, to the Hay Foundry & Iron Works.

Plant building for the Compresed Steel Shafting Co., Readville, Mass., 200 tons, to New England Structural Steel Co.

Mill building for the Royal Mills, Providence, R. I., 500 tons, to Phoenix Bridge Co.

Theater buiding, South Boston, 200 tons, to New England Structural Steel Co.

Factory building at Springfield, O., 300 tons; to Bellefountaine Bridge & Steel Co.

Building for Chandler Motor Car Co., Cleveland, 200 tons; to National Iron & Wire Co.

Sinton hotel, Cincinnati, O., 400 tons; to American Bridge Co.

Extensions for Whitaker-Glessner Co., Portsmouth, O., tonnage indefinite; to Fort Pitt Bridge Works.

CONTRACTS PENDING

Apartment house at Baltimore, 500 tons, contract pending.

Addition to department store, Springfield, Mass., 1100 tons, contract pending.

Fertilizer plant for Armour & Co., Chicago Heights, Ill., 400 tons, contract pending.

Bridge for Norfolk & Western, Columbus, O., 500 tons, contract pending.

Y. M. C. A. building, Columbus, O., 400 tons, bids in.

Substructure Madison street bridge, Chicago, 275 tons, bids in.

Building for Hershey Chocolate Co., 600 tons, Hershey, Pa., bids being taken.

Two government hangars at Newdorp, Staten island, N. Y., 800 to 1000 tons, bids to close shortly.

Floating drydock at Baltimore, 1800 tons, pending.

Theater for Marcus Loew, Euclid and 101st st., Cleveland, 500 tons; bids being taken.

Theater for Marcus Loew, Euclid and 117th st., Cleveland, 850 tons; bids being taken.

Biltmore hotel, Detroit, 10,000 tons; general contract let to George A. Fuller Construction Co.

Building for General Motors Co., Saginaw, Mich., 5000 tons; general contract let to Wood & Co.

Ideal Tire & Rubber Co., Cleveland, 300 tons; inquiry out.

Gibson hotel, Cincinnati, O., 7000 tons; Gustav Drach, architect, taking bids.

Theater, Portsmouth, O., 200 tons; bids being taken.

To Build Auto Bodies

Chicago, Oct. 28.—The Pullman Co., which for many years was able to concentrate its entire energies on the construction of sperial equipment for passenger use, sleeping cars, dining cars, parlor cars and later branching out into the building of practically all sorts of railroad car equipment, has been forced recently to take on other lines of work to keep its organization together. The policy of the railroad administration has been such that the company has been unable to find sufficient business in its regular lines. For some time it has been building cabinets for phonographs in its woodworking department, and recently it took a contract from the Packard Motor Co. for building automobile bodies.

Premiums Paid on Export Goods

Independent Mills Enjoy Large Profits on Foreign Business Now Being Booked —Heavy Purchasers Striving to Keep Out of the Market for the Present — Orders are Closed for 1920 Delivery

NEW YORK, Oct. 27.—With the increase in difficulties of placing new orders with the mills, many export houses report that foreign purchasers are showing a tendency to hold off with their inquiries. As a result there has been a slight diminution in inquiries from some quarters, although it is declared by a few responsible firms that the export business being done today is extremely large. It is declared unanimously that many difficulties confront the placing of an order and mills do not desire to open their books to new business so long as present unsettled conditions continue. While the strike of the millworkers is practically broken, the longshoremen's strike drags along with a fair prospect of settlement. At present, however, the miners are threatening to go out and thereby cut off the fuel supply.

Notwithstanding the desire of some of the heaviest foreign purchasers to hold off the export demand is such as to necessitate the offering of premiums to bring forth the products. In some cases, it is declared, the exporter has been compelled to offer the mills a premium of 1, 2 or 3 cents per pound for the particular commodity, and in some cases mills have refused to accept orders on which the purchaser proposed to pay a premium of $2 to $3 a ton. One exporter reported that he had paid a premium of 20 cents per 100 pounds on galvanized sheets.

It was learned during the past week that some Oriental business has already been placed "at mills' convenience." In the contract signed for these goods, it was proposed to make delivery some time before July 1, 1920. This is the first instance disclosed of foreign sales being made for 1920 delivery. The particular sale involved 800 tons of structural shapes. The export house arranging the deal is hoping to be able to get delivery some time during February or March. Another Japanese order calls for 400 tons of galvanized sheets. The purchasers agreed to sign the order on the basis of a delivery at mills' convenience, but the export house will be protected by a letter of credit established in New York by the Japanese purchaser which will be limited to approximately three months.

The great increase in export business during the past month is probably represented on the books of independent mills. Both the largest export houses have been doing a business to the limit of their ability, however. According to reports current here the United States Steel Corp. contracted to sell 30,000 tons of steel to the Kawasaki Dock Yard Co., of Kobe, Japan. This is said to be shipbuilding material and the cost, it is reported, will approximate $2,700,000.

Another sale of ship material is reported to have been made by a Philadelphia house upon an agency basis, the ships to be built in Japan with the steel purchased from the steel company here. Many houses have accepted small orders for shipbuilding material from Japanese companies. Typical of the business being done by these export houses were orders reported from Japan for 600 tons of black sheets, 1200 tons of ship plates and 14,000 boxes of tin mill black plate.

A new Japanese inquiry is for 4500 tons of ship material for delivery during the first half of 1920. An order for approximately 200 tons of wire was booked for the Orient during the past week. The Orient also purchased 200 tons of light rails, and 30 tons of light sheets. Another house reported the sale of 2500 tons of light rails to the Orient. One order for 1000 tons of small steel plates, a small tonnage of tube steel and a smaller tonnage of bars was reported to have been received from China. China also is inquiring for 3000 tons of scrap and about 1500 tons of rails.

Some old orders for shipment of rails to the Dutch East Indies are reported held back because of the failure of the mills here to make deliveries. Considerable apprehension is indicated in cables from Dutch East Indies asking for immediate delivery of 3000 tons. An order for approximately 10,000 kegs of wire nails has been declined as a result of a dispute over the price.

The relay rail market in Cuba is active. One house has sold 270 tons of relays to Cuba. Cuba has also purchased 50 tons of light sheets. There is at present an opportunity to sell Cuba 4000 lengths of 4-inch soil pipe. Due to the demand not only from Latin and South America, but also from the Orient, some of the export houses declare they are flooded with inquiries for open-hearth and bessemer wire rods. It is practically impossible to obtain this product. Similar difficulties are being experienced in connection with tin plate. One house reported that tin plate orders for export have been refused at $7.25, Pittsburgh.

Sales of sheets to South America have been reported. South America is now inquiring for 4000 tons of new 60-pound rails. Heavy rails, however, are difficult to find. The American Locomotive Co. has received an order from the Central Railway of Brazil for five Consolidated type engines, and two Mallet type, from the United Verde Copper Co. Chile is inquiring for 50,000 tons of relaying rails.

The Nonferrous Metals

*Future shipment from Singapore.
† American Smelting & Refining Co.'s price.
‡Open market.

NEW YORK, Oct. 28.—Departure of the leading copper sellers from their long established price of 23.50c did not stimulate the copper market to any great extent. The leading sellers dropped their quotation to 22.00c and did some business at lower prices. Second hand dealers immediately dropped their prices from around 22.50c to 21.50c, then to 21.25c. Dealers evinced some interest, but consumers, having large supplies of copper and also having their attention on the serious labor troubles, have not been active buyers. Speculators purchased and sold first quarter electrolytic at prices ranging from 21.50c to 21.75c.

The zinc market has been strong, largely based on export buying. Great Britain, France, Belgium and Japan have been buyers. Dealers also have been active in the market and have replenished their holdings. Consumers, on the other hand, including both galvanizers and brass mills, have been buying very sparingly. The prime western zinc market advanced about 10 points net the past week, the price on Monday being 7.75c, New York, but it was off a little today, 7.60c to 7.65c. High grade zinc is held at 8.00c to 8.25c, New York.

The American Smelting & Refining Co. advanced its lead price ¼c a pound Oct. 23 to 6.75c, New York, which followed a similar advance Oct. 16. Outside interests have been steadily asking and obtaining premiums. Lead is unquestionably in short supply. The outside lead market is about 6.75c to 6.85c, New York; 6.60c to 6.70c, St. Louis.

The London tin market has declined. The New York market is lower also while the Singapore price remains high. November and December shipment Straits tin from London could be had Monday at 53.25c, New York, while the same shipment from the Straits was held at 53.75c, and 53.50c to 53.75c today. Spot tin ex warehouse sold as high as 57.00c, while tin on dock, not available for immediate delivery, was quoted 53.75c.

Operations Show Steady Gains

Pittsburgh District Reports Furnaces and Mills on 80 Per Cent Basis While Companies in Chicago District Have 75 Per Cent of Their Men Back—Little Change at Youngstown—Southern Furnaces Prepared for Coal Strike

THE MOST notable gains toward a resumption of normal operations in the iron and steel industry have been made in the Chicago and Pittsburgh district, although the sixth week of the strike finds operators in all districts in a much more advantageous position than at any time since the strike was declared. In an effort to bolster up the waning hopes of the strikers various committees of trades union leaders are talking of issuing food cards, while the number of men reporting for work is steadily increasing in most of the districts still affected.

In the Chicago district the plants of the Illinois Steel Co. have 75 per cent of their former force at work, while the same percentage is reported by the Inland Steel Co. Both of these companies have increased operations at their furnaces and mills.

In the Pittsburgh district general operations have increased to 80 per cent at least. The Carnegie Steel Co. now has 39 of its 49 blast furnaces in blast, and work at practically all of its plants is moving toward normal.

In Ohio the most notable development in the strike during the past week, aside from an increase in operations at Cleveland, was the suspension of the mayor of Canton, O., by Governor Cox, following a riot at the plant of the United Alloy Steel Co., Canton. Native Americans were attacked by a mob of foreign agitators and six of them were beaten, one seriously. The governor decided to take a hand to insure protection for loyal workers when local authorities failed to act, and 1000 militiamen were sent to Akron, O., nearby, ready for immediate despatch to Canton in the event of further disorder.

In Youngstown operating conditions have not changed much since last week, while in Cleveland some gains are reported by mills and furnaces. Five hundred men have now returned to the H-P nail works of the American Steel & Wire Co. and the company is operating its coke plant on a partial basis. The McKinney Steel Co. now has one-half of its open hearths in operation, while its blooming mill and one furnace started last week are continuing. The Otis Steel Co.'s Riverside plant now is operating at 100 per cent.

In the Buffalo district, the Donner Steel Co. reports the return of 1000 of its workmen, and, in addition to its other operations begun last week, a 14-inch bar mill is to be placed in operation this week. More men have returned to the plant of Rogers, Brown & Co., while 2500 men are now at work at the plant of the Lackawanna Steel Co. Other plants in the Buffalo district are operating at 100 per cent.

The situation in the East, New England and in the southern states has so far improved that the strike in those districts is considered at an end. The furnaces and mills in the Birmingham district are prepared for a strike of coal miners and it is said that the prospective strike will not interfere with their operations to any great extent unless it should be protracted. The Woodward Iron Co. has banked the Vanderbilt furnace to conserve fuel.

Workers Beaten; Ohio Mayor Suspended

CLEVELAND, Oct. 28.—Aside from outbreaks of violence at steel plants in Canton, O., which were quelled after Governor Cox ordered out 1000 state militiamen, strike conditions throughout Ohio have continued to improve steadily. More men have reported for work and many plants are reporting they are operating at almost normal capacity.

The calling out of the state troops by Govrnor Cox, followed the outbreak of lawlessness on the part of striking workmen at the plant of the United Alloys Steel Co., Canton, last Friday night and Saturday. At this plant, six workmen employed by the company, all native Americans, were beaten by a crowd when they left the plant, one of them being seriously injured. In the rioting which followed many shots were fired and for a time the situation got beyond the control of the municipal authorities. At a meeting in Governor Cox's office at Columbus, O., Monday, Mayor Poorman, of Canton, was suspended for 30 days, pending a hearing, because of his failure, according to the governor's charges, to do all in his power to provide adequate protection. Governor Cox has appointed an acting mayor and this official plans to increase the police force and furnish the mills in the district all the protection necessary. The militia encamped at Akron, O., ready for service if necessary at Canton.

At Cleveland operations are in progress at practically all plants. More than 500 men have returned to the H-P nails works of the American Steel & Wire Co. The company's coke plant is operating on a partial basis, but its other plants have not been reopened, although many men have reported for work. One furnace is in blast at the McKinney Steel Co.'s plant, while half of the company's open hearths and the blooming mills are operating. The Upson Nut Co. is oprating on a small scale, while one blast furnace of the Cleveland Furnace Co. is running. The Lakeside plant of the Otis Steel Co. is in partial operation, while the company's Riverside plant is working 100 per cent. General indications point to normal operations here soon. Operations at the plant of the National Tube Co., Lorain, O., have not been affected.

Operations at 80 Per Cent in Pittsburgh District

Pittsburgh, Oct. 28.—General operations in the iron and steel industry in the Pittsburgh district have increased to 80 per cent or more. Strikers are continuing to return in large numbers, except for the common laborers who are slow in getting back. The Carnegie Steel Co. has 39 out of 49 blast furnaces in operation. Its ingot capacity in Ohio and Pennsylvania is 70 per cent engaged. Its Homestead plant is operating at 85 per cent of capacity, while at its Ohio works five open hearths and six bar mills are in operation. Its McDonald, O., plant is down because of the lack of power. The Clairton by-product plant is operating normally,

and construction work has been resumed, including work on a retaining wall along the river. The Edgar Thompson works is operating at a better rate than at any time since the beginning of the strike. All its finishing mills are now in operation. The rail mill was started today. The Carnegie company also has started one bar mill at its Monessen works which is the first unit at the plant to resume since the strike. Much interest attaches to a meeting of steel company railroad employes scheduled for tonight in Pittsburgh.

Buffalo Furnaces and Mills Make Steady Gains

Buffalo, Oct. 28.—Despite claims of the union organizers that few skilled steel workers are returning to work, operating conditions of the mill and furnace in this district continue to improve. All operations begun at the plant of the Lackawanna Steel Co., including the blowing of a blast furnace and the operation of some open-hearth units have continued, and men are continually reporting for work. It is believed that more than 2500 men are working at this plant. The Donner Steel Co., reports the return of over 1000 of its men, and the continued operation of one blast furnace and certain other units. A 14-inch bar mill is expected to be placed in operation by Wednesday. The return of a number of men at the plant of the Roger-Brown Iron Co. is reported. Other furnace and mills in this district continue 100 per cent operation. The parade of strikers on Saturday night was a keen disappointment to strike leaders, while they claim 12,000 men merched the real figure is reported to have been nearer 3000.

Little Change Reported in Mahoning Valley

Youngstown, O., Oct. 28.—Little change in steel plant operating conditions throughout the Mahoning valley is in evidence this week. Two stacks of the Republic Iron & Steel Co.'s Haselton group of blast furnaces are supplying metal for four open-hearth units. This company plans to place several finishing departments under power this week. The Youngstown Sheet & Tube Co. has all departments, including six open hearths in operation.

The Carnegie Steel Co.'s bar mills at the McDonald plant and at the Lower Union works are rolling. At its Ohio works the company has one bessemer converter blowing and is tapping metal from one blast furnace and two open-hearth furnaces. The blooming mill at this plant also is running. The Brier Hill Steel Co. continues to operate one blast furnace, its coke ovens, five open hearths, its blooming mill and one plate mill.

Two sheet mills were started Tuesday afternoon by the Sharon Steel Hoop Co., members of the Amalgamated Association of Iron, Steel and Tin Workers returning to work in accordance with their contract.

At Niles, O., the situation is quiet. Not a roll is turning in any of the sheet mills and it is stated that the mill men, who are on a strike, have been instrumental in calling a sympathetic strike of the majority of the building-trade workers there. All construction work in Niles ceased last week and remains at a standstill.

Those following the strike situation in Youngstown state that the city is swarming with I. W. W.'s and anarchists who are making every effort to encourage strikers to hold out even though they have to resort to underhand tactics. They are said to have caused several disturbances last week such as the cutting of automobile tires in order to prevent workmen being hauled inside the works. Near the Brier Hill Steel Co.'s plant two houses which belonged to employes of that company were set on fire, the incendiaries having been shot by policemen. Many of the strike leaders operating in this district are noted agitators and it is believed if ample protection from rowdies and pickets was given, fully 90 per cent of the mill men would return to work immediately.

More Furnaces Active in Chicago District

Chicago, Oct. 27.—That the steel strike is ended in the Chicago district is a statement relatively true, although subject to some reservation. Plants of the Illinois Steel Co. are operating with an average of 75 per cent of their force and producing about 50 per cent of normal output. This discrepancy is due to the fact that reorganization of forces has not advanced sufficiently to give ordinary efficiency. At the Gary plant eight of 12 blast furnaces are producing iron, while at the South Works only five of 11; at Joliet one of four, and at Milwaukee one of two are active.

The Inland Steel Co.'s plant at Indiana Harbor now has about 75 per cent of its force back on the job and is blowing two of three blast furnaces. The third furnace is being relined.

The Gary plant has as many men as it can handle at present and will increase its force only as the men can be placed advantageously. A large number of former employes will not be taken back. They include those whom the government has found are active in spreading revolutionary doctrines.

Since troops have been maintaining order in Gary and Indiana Harbor, the return of workers has been rapid.

Some uneasiness is caused by the possibility of a sympathetic strike on the part of railroad men.

Alabama Furnaces Prepared for Coal Strike

Birmingham, Ala., Oct. 28.—While there is hope that the government will avert the coal strike, preparations are being made in the Birmingham district for emergencies. It is estimated that coal production in Alabama is not less than 80 per cent of capacity of the mines. Retail yards claim to have about a month's supply on hand. Steam coal is being shipped down the Warrior river for Mobile and New Orleans shipping interests, and it is said the mines along the river will not be affected by the strike, the men having promised to remain at work. The state has made preparations to maintain order, while the sheriffs of the coal counties are prepared for emergencies.

The banking of the Vanderbilt furnaces by the Woodward Iron Co. to economize on fuel is not considered particularly significant. Furnace companies of this district expect a minimum of trouble. Mine unions claim a membership of between 12,000 and 15,000, and leaders say that a large percentage of the remaining 25,000 employed in the coal industry in the district also will cease work Nov. 1. Operators do not believe that the union has more than 8000. Alabama's coal production now is about 325,000 tons a month.

Will Resume on Nov. 3

Cincinnati, Oct. 27.—A statement has been issued by officials of the Andrews Steel Co., and the Newport Rolling Mill Co., Newport, Ky., that they expect to resume operations in all departments Nov. 3. The plants have been idle several months on account of labor troubles.

Call Annual Meeting

The annual meeting of the National Founders' association will be held at the Hotel Astor, New York, Wednesday and Thursday, Nov. 19 and 20.

Minimum Effect

Of Steel Strike Shown by Steel Report—August High Mark

The minimum effect of the steel strike, which began Sept. 22, on steel earnings during the third quarter is indicated by the report of the United States Steel Corp., for the three months ended Sept. 30, which shows for the period the highest quarter earnings attained during the current year. Total earnings after operating expenses and federal taxes were $40,177,232, as compared with $42,961,589 for the corresponding quarter of 1918. The report does not disclose the sum charged off from earnings for estimated taxes.

The crippling force of the short period of the strike in the quarter was felt to some extent, however, as is indicated by the fact that September earnings represent a decline of 16 per cent from the high total reach for August.

The surplus for the quarter after regular dividends was $11,105,167, which compares with a surplus of $5,308,587 for the previous quarter and with $4,822,316 for the initial quarter of the year. The comparative income account for the 1919 and 1918 third quarters follows:

	1919	1918
July	$13,567,100	$15,261,107
August	14,444,881	14,037,613
September	12,165,251	13,612,896
Quarter earnings after operating expenses and federal taxes	40,177,232	42,961,589
Depreciation and sinking funds	11,065,803	10,892,197
Net income	29,111,429	32,069,392
Interest and bond premium	5,347,562	5,404,081
Balance	23,763,867	26,665,311
Preferred dividends	6,304,919	6,304,919
Common dividends	6,353,781	*16,520,031
Surplus for quarter	11,105,167	3,840,561

The August earnings established the highest record for that month since August of 1917 and the highest for any month since July of 1913, when the earnings were $15,261,107. The total net earnings for the quarters of 1919 to date follow:

First quarter	33,513,384	.....
Second quarter	34,331,301	.....
Third quarter	40,177,232	.....

Acquires Furnace Plant

The Iron Products Corp., which has recently acquired the Essex Foundry Co. and the Central Foundry Co., has purchased the properties of the Chattanooga Iron & Coal Corp., Chattanooga, Tenn., consisting of one modern skip-fed blast furnace and 20,000 acres of developed coal and ore lands tributary thereto. The Iron Products Corp. likewise owns and operates the Tuscaloosa furnace at Holt, Ala., with coal mines, Semet-Solvay by-product ovens and ore mines. The nine foundries of the company, located in the north and south, are thus amply protected for metal. The combined annual output of the furnaces is in the neighborhood of 200,000 tons. Any surplus metal will be offered for sale.

Replogle Steel to Take Wharton Property

The Replogle Steel Co. is being organized to take over the mines, ore fields and blast furnaces of the Wharton Steel Co., Wharton, N. J., and the Wharton & Northern railroad which leads from the company's mines to its plant. No official statement has been issued regarding the new company but it is stated that its formation will mean the eventual extension of its activities to embrace the manufacture of steel products on a broad scale. It also is understood that some 250,000 shares of no par value capital stock will be issued by the new company and that the issue has been underwritten by Kuhn, Loeb & Co., at $50 per share. It is expected that an offering of the stock in the neighborhood of $55 per share will be made sometime this week.

The Wharton properties were purchased three years ago by a syndicate headed by J. Leonard Replogle, who became head of the company, but retired temporarily while he served as director of steel supply for the war industries board. At the time of purchase much of the property was in a rundown condition. Since then, the J. Leonard Replogle mine has been developed and now is estimated to contain more than 100,000 tons of high grade iron ore.

To Erect New Stack

Chicago, Oct. 28.—The Steel & Tube Co. of America is taking bids for the construction of a blast furnace stack to be erected at once either at the plan of the Iroquois Iron Co., at South Chicago, or at the company's new plant at Indiana Harbor. This will be a merchant stack, of large capacity, and probably will follow closely the lines of the two stacks recently built by this interest, one at South Chicago and the other at Indiana Harbor. Construction will be started as early as possible. It is expected the new stack will be put into service the latter part of 1920.

More Production

Palmer Tells Massachusetts Manufacturers Will Solve Problems

Greater industrial production was the keynote of an address made by Atty. Gen. A. Mitchell Palmer, before the fourth annual meeting of the Massachusetts Associated Industries held at Boston, Oct. 24 and 25. The sessions brought together nearly 600 manufacturers of the state for the purpose of discussing industrial problems. Mr. Palmer who spoke on the subject, "Costs and Production," declared that the best means of reducing costs is by increasing production. "Americans can produce more in their mills and factories than any people on earth," he said, "and the one great thing which will bring back normal conditions to America is the utmost production of the normal American men and women. The question naturally asked is, how is this increased production to be brought about? One way is through education. We must advertise production necessity."

Speaking before one group of the session, Herbert O. Stetson said that arbitration cannot help but fail where demands are always on one side and concessions on the other, and that the best way out is to cultivate friendship with the fair and honest element in the labor unions. Charles F. Weed, vice president First National bank, Boston, talked on possibilities of trade in China. Collective bargaining which was the rock on which the Washington industrial conference split, was defined by Frank T. Dresser, general counsel for the organization.

Edgar J. Rich addressed the association on the subject of industrial transportation problems peculiar to New England. He pointed out the difference between the problem of New England industries, and that of industries in other parts of the country. He spoke of the threatened passage of a rigid long and short haul clause.

Hearings to Commence

Washington, Oct. 28.—The federal trade commission announced today that hearings on the steel price basing point controversy raised by the Western Association of Rolled Steel Consumers against the United States Steel Corp. and other producers, will begin at 10 o'clock Tuesday morning, Dec. 2. So far over 100 producers and consumers have expressed their views on the subject and with the commencement of hearings they will be given an opportunity to submit oral testimony.

Baltimore Plant Makes Steel for English Airplane Motors

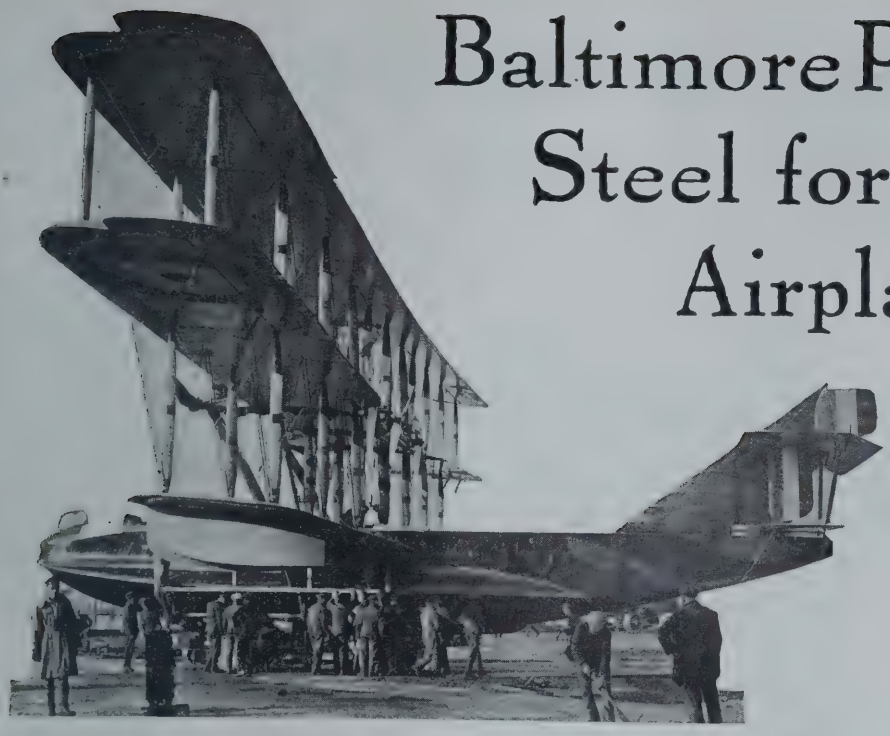

Fig. 1—Largest seaplane in world equipped with five 360-horsepower engines of type mentioned in accompanying article

Airplane Parts of Electric Steel Forged and Machined in United States and Assembled in England.

OUT of the vast destructiveness of war and its general setback to civilization, trade and industry have grown certain advantages resulting from the operation of the law of compensation. Success of arms depends to a large degree upon the genius of the peoples of the nations waging a conflict and this never was more true than in the case of the recent war. Chemists, metallurgists, manufacturers, engine builders, inventors—in fact all the representatives of the sciences, arts and crafts, were called upon to intensify their endeavors so as to product instruments that would be of aid to their respective countries to bring victory.

Because of the immense importance of steel and the great part it plays in war as one of the prime essentials, no greater responsibility rested with any line of producers during the conflict than with the manufacturers of steel. America having come into the struggle, her manufacturers were stimulated in their eagerness to serve their country and the associated powers.

While lines of specialization and high quality had been operating successfully in the United States before the war, when it came manufacturers learned that they were to be called upon for vastly increasing and new demands to supply vital parts of steel that must be absolutely dependable. This demand, strengthened by the war, continues to reflect great volume and the increased attention paid to the making of high quality steel marks a new turn in this branch of the iron and steel industry.

A splendid example of the demand for quality steel during the war, and which has developed in connection with pursuits of peace, is found in the requirements for special steels for airplane parts. It is generally conceded that in airplanes the design and construction of each part are subjected to the supreme test. American steelmakers were asked to and did produce material for such parts, not

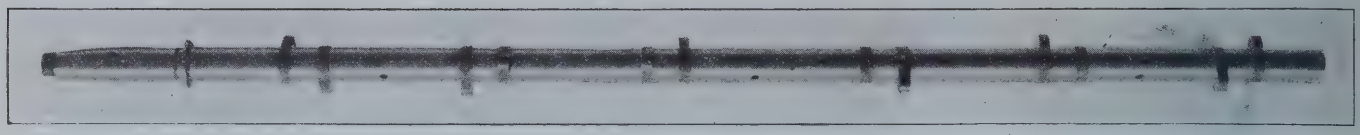

FIG. 3—COUNTERBORED CAMSHAFT FOR ROLLS-ROYCE AIRPLANE MOTOR

only for parts for American airplanes, but also for the well-known Rolls-Royce eagle motors. Moreover, the high-grade machining work for these parts was done in the United States. The manner in which United States interests were called upon to produce and machine steel for Rolls-Royce engines is a bit of war history that is not generally known. About two years ago representatives of Rolls-Royce, Ltd., England, came to the United States to look into the possibilities of getting certain parts of the Rolls-Royce engines made here. Among other steel sought was the 5 per cent case-hardening grade. A trial order was placed with the Hess Steel Corp., Baltimore. The steel was produced, given a thorough test, and met the severe requirements in every respect. It was then decided to give the Hess corporation orders for the manufacture in this country of all steel requiring the following analysis: Carbon, 0.08 to 0.14 per cent; silicon, 10 to 25 per cent; phosphorus and sulphur, under 0.03 per cent each; manganese, 20 to 35 per cent and nickel, 4.80 to 5.40 per cent. The steel was made for the manufacture of complete airplane parts for eagle motors which were installed in machines used for all military purposes such as bombing, fighting and scout work. With the signing of the armistice the interest in air transportation has been receiving unprecedented attention and the motors still are in great demand. Fig. 1 shows a seaplane, said to be the largest in the world, which is equipped with five 360-horsepower Rolls-Royce engines. The Hess corporation made the forging bars and finished machine bars for the airplane parts, while the forging was done by the J. H. Williams Co., Brooklyn. The Williams company shipped the forging to the other companies for the machine work. These latter were the H. H. Franklin Mfg. Co., Syracuse, N. Y.; the F. B. Stearns Co., Cleveland; the Taft-Pierce Co., Woonsocket, R. I., and others. The companies doing the machine work also did the heat treating and case hardening. The completed parts were then shipped to Derby, England, where the Rolls-Royce eagle engines were assembled and installed in the planes. The parts illustrated in Figs. 2 and 3 are typical of the forged and machined work turned out in these American plants during the war, and are used in engines varying from 280 to 360 horsepower, of the type illustrated in Fig. 4. The Hess Steel Corp. has six Heroult electric furnaces as illustrated in Fig. 5.

Germany a Future Tool Factor

Will be Formidable Competitor in World's Machinery Markets—Manufacturers Now Harassed by High Taxes, Slacking Labor and Depreciated Currency—Best Features of American Tools Copied or Adopted

BY ALEXANDER LUCHARS

LAST May, the author of this article, Alexander Luchars, who is president of the Industrial Press, New York, publisher of Machinery was appointed by the department of commerce as special trade commissioner to acquire first hand information regarding the machine tool situation in Europe. His report on conditions in Great Britain, already has been published. This present report of conditions as he found them in Germany is published under his own signature, since he resigned as trade commissioner from the department of commerce on Oct. 1. The article is dated Oct. 8, although it was written in Berlin two months prior to that time. Mr. Luchar's report to the department of commerce, dealing with European markets for machine tools in a general way, has been published by that department under date of Oct. 11, although written in Paris on Sept. 8, 1919, while Mr. Luchars still was trade commissioner. It will be presented in a subsequent issue of THE IRON TRADE REVIEW.

DEFEAT has not changed Germany's characteristics, good or bad, but it has changed her opinions and ideals. If she breasts the winter of 1919-20 without another revolution, and the chances are she will, Germany will enjoy a period of gradually improving industrial conditions. Food will be more plentiful and therefore cheaper; the mark will be worth more; wages will not be lower but men will be more willing to work and production percentages gradually will increase. If this forecast is correct, Germany will, in a few years, become a formidable competitor in the machine tool markets of the world. At present, however, the exact opposite of the conditions outlined is true.

After carrying out the terms of the armistice as regards coal for France, Germany will have left for the winter of 1919-20, approximately 40 per cent of what she used last winter. The shortage will doubtless be increased further by the prevailing strikes and through loafing and slacking. This shortage will of course affect factories so that many will close down or operate on reduced time schedules. It is expected that full wages will be paid in such cases, part by the government, part by the employers; thus adding to the already crushing taxes.

Present taxes often work severe hardships. One maker of small tools, who had been in business 50 years, sold out for 1,000,000 marks. The new tax law took 800,000 marks and because the income on the remainder was not sufficient to live on, he went to work again at the bench in the shop he formerly owned. In addition to taxes on income and profits, those on principal or business capital range from 15 to 65 per cent, although payment can be made in 30 annual installments at 6 per cent interest.

Employers are harassed by labor's demands and restrictions; the difficulty of obtaining material; of disposing of their product when ready; depreciated currency; and many smaller factors, all in addition to the matter of taxes. But the future is not all gloomy. Some say that if the workmen will only work for whatever wages can be agreed upon, the other evils can be taken care of in time. Some believe labor is beginning to see that demoralization in fundamental conditions affects working people more than any other class, and that some reasonable working basis must be reached on which the employer and employe can stand.

A law has been introduced in the national assembly giving a representation in the management of each business to the workers, but many manufacturers do not think that such a representation would mean interference. Partial strikes in departments of vital importance to the works are a favorite resort; for in such cases the workers in the departments not on strike come to the shop and play at working, but produce almost nothing for lack of material, causing great loss to the management which must pay their wages. In the case of total strikes no wages are paid. One serious obstacle to industrial stability and progress is the lack of a recognized national executive.

Will Not Regain Former Place

No one with whom I talked believes that Germany will ever regain her former position. Conservative business men say that the return to normal economical conditions is not a question of months but of years; one, whose opinion has great weight with me, puts the time at 5 to 10 years. Food now controls the situation, and unless it becomes more abundant and cheaper during the coming winter, many expect another revolution. The supply of certain kinds of food fortunately is increasing, although meat and bread cards still are required. The former entitles the holder to two portions of meat and the latter to five slices of black bread daily.

Prices of all kinds of labor, metals and materials, and especially of machine tools, naturally have increased much more in proportion than in America. Prices have increased since the armistice, although the supply of labor should be greater.

A general comparison of wages paid to machinists and machine shop workers in 1914 and 1919 is given below:

	Wages per hour	
	1914	1919
Lathe hand	M. 0.60 to M. 0.75	M. 3.25 to M. 4.00
Milling machine hand	0.56 to 0.60	2.55 to 3.50
Planer hand	0.60 to 0.72	2.90 to 3.75
Assembler and fitter	0.56 to 0.70	2.70 to 3.60
Drilling hand	0.48 to 0.56	3.00 to 3.50
Blacksmith	0.95 to 1.15	3.50 to 4.00

On piece work the man must be guaranteed a minimum wage of about 25 per cent more than for day work. No large wages are earned at piece work, since the men will not produce more than an average amount of work under any conditions.

The above figures, however, do not afford an accurate comparison of labor costs on account of time lost loafing, talking and "slacking." In the machinery industry the average hourly product under the 8-hour day is about 50 per cent of what it was in 1913-14. In the Ludwig Loewe works I was told that the product per man per hour for the first six months of 1919 was 52 per cent of what it was in 1913-14. In some works it is much less.

Besides the increased wages and diminished output, manufacturers must reckon with extra bonuses or contributions in cash, up to M. 800 for each person or member of the organization such as foremen, draftsmen and superintendents, to enable them to pay their debts. The upper class employes have been giving more trouble lately than the workers.

All over Germany the 8-hour day

prevails, but the division of the day varies in different localities. In most Berlin machine shops the workers start at 7 o'clock, work until 12.10 p. m., take 20 minutes for lunch, and quit at 3 in the afternoon. On Saturday the quitting hour is 1, making 44½ hours a week.

Raw Material Prices Increase

The following figures give an idea of the increases in the prices of materials from 1914 to 1919. The heavy increases in the prices are due not to profiteering, but to greatly increased manufacturing, transportation and other costs. Foundry pig iron, which was quoted at M.74.50 in the second quarter of 1914, was quoted at M.215 in the first quarter of 1919, and M.356.50 in the second quarter of this year. Prices have now been lowered by M.52 to M.90 per ton, but the pig iron union states that the blast furnaces are working at a heavy loss.

The materials used in making pig iron have, of course, increased accordingly, coal briquettes having advanced from M. 13.75 to M. 66.10, and blast furnace coke from M. 17.00 to M. 88.85 per ton.

The advances of prices for raw and half-finished products are given in the following table; the prices given are marks per ton:

	Ingots	Billets
May, 1914	M. 82.50	M. 95.00
Jan. 1, 1919	285.00	300.00
March 1, 1919	385.00	400.00
May 1, 1919	405.00	475.00
	Sheet Billets	**Sections**
May, 1914	M. 97.50	M. 110.00
Jan. 1, 1919	305.00	320.00
March 1, 1919	405.00	420.00
May 1, 1919	480.00	520.00

Copper is now selling at M. 5125 a kilogram (official price). High speed steel sells for M. 27.50 per kilogram.

The following table, compiled by Prof. Schlesinger, an authority on the subject, gives the output of German machine tools from 1913 to 1918, and a comparison of prices as well:

Year	Production in Million Marks	Selling Price, Mark Per Kilogram	Production in Tons
1913	1060	1.00	1,060,000
1914	1045	1.10	950,000
1915	695	1.30	530,000
1916	660	2.00	330,000
1917	1720	2.50	680,000
1918	780	3.00	260,000

Many varying estimates have been made of the value of machine tools now in stock in Germany, but conservative authorities place the amount at between M. 200,000,000 and M. 300,000,000, which is a normal figure. This does not include tools owned by the government, but those are not expected to come on the market. The tools in private stocks are said to be second or third rate products; and this statement is supported by the fact that nearly all first-class German machine tool makers are behind in their deliveries, several claiming from six to nine months.

All German prices must be considered in relation to the impaired value of the mark, which is now quoted at about 17 to a dollar, as compared with 4¼ in 1914. Its effect on imports into Germany is evident, and establishes prohibitive prices for American-made machine tools. The price of German machine tools was advanced three times by the government during the war, 43½ per cent in 1917, and in 1918, 66 per cent over the 1917 prices. No further government advance was made, but manufacturers advanced prices from 20 per cent to 40 per cent at the end of 1918; and many prices have further advanced (except on war material tools) during 1919. Special machines for peace-work use advanced up to 200 per cent, and some small machine tools as much as 500 per cent over 1914 prices. But German tools of the best makes still sell for considerably less than similar American tools can be sold for according to the following 1919 prices for best makes of German machine tools furnished me by two well known German dealers:

Gap lathes, 12-inch, 3½ feet between centers	M. 3400
Gap lathes, 16-inch, 3½ feet between centers	4800
Gap lathes, 16-inch, 5 feet between centers	5100
Gap lathes, 18-inch, 3½ feet between centers	4500
Gap lathes, 20-inch, 5 feet between centers	7400
Gap lathes, 20-inch, 7 feet between centers	7750
Gap lathes, 26-inch, 7 feet between centers	10300
Engine lathes, with gap, lead-screw and feed rod, 16-inch, 5 feet between centers	7000
Engine lathes, with gap, lead-screw and feed rod, 18-inch, 3½ feet between centers	8000
Engine lathes, with gap, lead-screw and feed rod, 18-inch, 5 feet between centers	8500
Plain milling machines (according to size)	from M. 4000 to M. 9000
Universal milling machines (according to size)	from M. 7500 to M. 8500
Vertical milling machines	7200
Crank shapers, 14-inch	4200
Crank shapers, 18-inch	5000
Crank shapers, 22-inch	7000
Drilling machines, 20-inch	1300
Drilling machines, 22-inch power feed	2700
Four-spindle automatics, 1¾ and 2⅛-inch	M. 26,000 to M. 27,500

German Prices Lower

ON ACCOUNT of their greater accuracy, American-made machine tools of the best makes will sell for much better prices than German machines of the same type and size. No American machine tools have come into Germany for about three years except those that have been shipped through Holland and Sweden, hence no reliable comparisons can be made between 1914 selling prices and prices that would have to be received now. Judging from what former agents of American manufacturers have told me, however, the figures would range from four to seven times what they were in 1913-14 and from 50 to 75 per cent more than similar German tools sell for. One dealer estimated that an American 14-inch lathe, which sold for M.2000 in 1914, now would bring M.11,000 to M.12,000, while a German tool of the same kind would sell for M.6000 to M.7000. A Gleason bevel gear planer, which sold in 1914 for about M.9000, now would have to be sold for about M.60,000. (The German mark now is quoted at about 17 to the American dollar as compared with 4¼ in 1914.)—Mr. Luchars.

However, I believe that the above prices are lower than those for which first class machines can be bought. The following table gives a comparison of prices of German machine tools; all prices are subject to change from day to day many makers refusing to quote until tools are ready for delivery:

	1914	1919
High speed engine lathe, geared head, 18-inch, 3½ feet between centers	M. 2800	M. 9000
Tool room lathe, 14-inch, 3½ feet between centers	2400	8600
Milling machines, hand	230–280	950
Plain, three different sizes	800	2700
	2600	8100
	4400	13000 to 14000
Universal, including head	3500	10000 to 12000
Radial drilling machines, 3½ feet	2400	8000 to 10000
Radial drilling machines, 5 feet	4800	16000 to 18000

American Tools Are Copied

German manufacturers are turning out far better tools than they did in 1913-14. The designs of many well known American tools are followed, some are faithfully copied and others adapted. The list given below includes makers of characteristic types of American tools which had a ready sale in Germany before the war. General or standard machine tools, such as plain, vertical and lincoln type milling machines, sensitive and upright drilling machines, vertical slotting machines, planers, shapers, engine lathes, tool grinders and many other tools, which were manufactured more or less along American lines before the war, have been taken up in increasing quantities since 1914, by a considerable number of German makers. It is not the intention to include any of these in the following list of machines copied or adapted:

Acme Machine Tool Co., Cincinnati, O.; 2⅜-inch size geared head machine made by F. A. Scheu, G. m. b. H. Berlin.

Acme Machinery Co., Cleveland; bolt machinery made by Concordia Maschinenbau, Halle a. S. and August Meiselbach Nachf., Leipzig.

Baker Bros., Toledo, O.; two sizes of keyseaters made by A. H. Schutte, Koln-Deutz.

Bilgram Machine Works, Philadelphia; machines licensed to J. E. Reinecker, Chemnitz-Gablentz, are now also made by a firm in Leipzig.

Blanchard Machine Co., Cambridge, Mass.; grinder brought out by Schuchardt & Schutte, Berlin, with round and square table.

Brown & Sharpe Mfg. Co., Providence, R. I.; small screw machines, made in large lots and first-class workmanship by Samsonwerk, G. m. b. H., Berlin; while Ludwig Loewe & Co., Berlin, have also brought out another machine of this type; the No. 2 surface grinder also is made in large lots by Samsonwerk in Berlin and sold at the price of M. 5750; the same firm also makes the Brown & Sharpe No. 1 universal cylindrical grinder.

Bullard Machine Tool Co., Bridgeport, Conn.; while

the Deutsche Niles has made a vertical turret lathe along the Bullard lines, this competition seems to have died away as well as that of Sondermann & Stier, A. G. Chemnitz.

Cincinnati Bickford Tool Co., Cincinnati, O.; plain radial drilling machines of the latest Bickford type are built in quantities by Zimmerman-Werke, A. G., Chemnitz; and the smaller sizes of radial, 3 and 4 feet, are built by several firms in smaller lots. Upright drills of good design and workmanship are built by Gebr. Reinhold, Gera, as a specialty, and also by a number of other firms.

Cincinnati Milling Machine Co., Cincinnati, O.; No. 1 tool grinder made by Fritz Werner, A. G. Berlin; also Collet & Engelhard, Offenbach, A. M; Schuchardt & Schutte, Berlin; while A. H. Schutte, Koln-Deutz, makes the No. 1½ size.

Cleveland Automatic Machine Co., Cleveland; automatics built by Schubert & Salzer, A. G. Chemnitz; Gildemeister & Co., Bielefend; A. H. Schutte, Koln-Deutz; and Leipziger Werkzeug-Maschinenfabrik, A. G., Leipzig.

Fellows Gear Shaper Co., Springfield, Vt.; a machine very similar in working principle, using the same tools, is built by Max Rober & Co., G. m. b. H., Chemnitz; built in larger sizes.

Fitchburg Machine Works, Fitchburg, Mass.; automatic lathe made by Gildemeister & Co., Bielefeld; and by Heidenreich & Harbeck, Hamburg.

Gould & Eberhardt, Newark, N. J.; shapers with the same characteristic details are made by several firms; the Samsonwerk, Berlin, have a new design, "with very small openings in frame," brake, splash lubrication, etc., with some details patented.

Higley Machine Co., South Norwalk, Conn.; saws made by Ernst Krause & Co., Vienna, Otto Doring, Berlin; Irmischer & Co., Saalfeld, a. S.

International Machine Tool Co., Indianapolis; Libby turret lathe (geared head) made by Zimmermann-Werke, Chemnitz.

Jones & Lamson Machine Co., Springfield, Vt.; turret lathe advertised by C. G. Haubold, Jr. 1, G. m. b. H. Chemnitz; and F. A. Scheu, G. m. b. H., Berlin.

Landis Tool Co., Waynesboro, Pa.; grinding machines made by Fritz Werner, A. G. Berlin-Marienfilde; Schubert & Salzer, Chemnitz; A. H. Schutte, Koln-Deutz; Schuchardt & Schutte, Berlin, and several others.

J. N. Lapointe Co., New London, Conn.; broaching machines made by Dolze & Slotta, Coswig, Saxony.

R. K. LeBlond Machine Tool Co., Cincinnati, O.; tool grinder made by Zimmermann-Werke, Chemnitz, in large lots.

Mitts & Merrill, Saginaw, Mich.; keyseater made by Elbe-Werke, Dresden; and Mammutwerke, Nurnberg.

National Acme Co., Cleveland; multiple-spindle automatic machines made by A. H. Schutte, Koln-Deutz; Gildemeister & Co., A. G., Bielefeld; Leipziger Werkzeug-Maschinenfabrik, A. G., Leipzig; the single-spindle Gridley automatic machine is made by Heidenreich & Harbeck, Hamburg; Gebr. Bohringer, Goppingen; Hasse & Wrede, Berlin; de Fries & Cie., A. G., Dusseldorf.

New Britain Machine Co., New Britain, Conn.; automatic machines made by Gildemeister & Co., A. G., Bielefeld.

Norton Co., Worcester, Mass.; Ludwig Loewe & Co., Berlin, is licensed to make Norton grinding machines.

Potter & Johnston Machine Co., Pawtucket, R. I.; this type of machine made by Herm. Schroers, Crefeld; deFries & Cie., A. G., Dusseldorf; Magdeburger Werkzeugmasdhinen-Fabrik, Magdebrug; Leipzger Werkzeug-Maschinenfabrik, A. G., Leipzig; Zimmermann-Werke, Chemnitz.

Builds Tools of Many Types

Among the leading German manufacturers of machine tools should be included Schuchardt & Schutte and Alfred H. Schutte. The former firm has its own factories and also controls the output of several others, making Blanchard and Landis type grinding machines; Cincinnati type tool grinders; turret lathes up to 2⅜-inch size; medium-sized milling machines; lathes; drilling machines; engraving machines; woodworking machines; and special machines for various types of manufacture; measuring instruments and tools; several types of small tools; grinding wheels; furnaces, etc.

Alfred H. Schutte has four factories, at Cologne-Deutz, Cologne-Ehrenfeld, Berlin-Reptow and Siegen-Marienborn. At Mr. Schutte's Cologne works, which are modern in every respect and employ 600 workmen, I saw the new Schutte four-spindle automatic. This machine has a single pulley drive and geared head, a capacity for bars up to two inches in diameter, and is provided with all the means for rapid and accurate production found on various types of American multiple-spindle automatic machines, including spindles mounted in adjustable bearing boxes with end thrusts taken by ball bearings, an auxiliary tool head, a special arrangement for rapid drilling and ample provision for lubricating oil for the cutting tools. The price is M. 27,500. Nearly all the German machine tool builders made money during the war. Some made large fortunes, but these now find them diminishing rapidly through heavy taxation, increased costs and governmental requirements in regard to wage payments to men not employed. The decline in earnings began with many firms before the war closed and the earnings of Ludwig Loewe & Co., probably are typical of many. This company's net profits and dividends in 1915 totaled M. 4,338,000; in 1916, M. 3,773,000; 1917, M. 4,485,000, and in 1918, M. 2,584,000. It employed 4000 workers during the war, many of whom were women but now about 2500 workmen are engaged and a few women. Its new building, begun in 1914, is not yet fully equipped, about half of it being devoted to the manufacture of milling machines. Dr. Waldschmidt still is managing director, Mr. Bechstein occupying his former position, and Mr. Huhn being in charge of the mechanical department.

In 1917-18 the Siemens Works made a clear profit of M. 14,000,000; but as the increase in wages this year already amounts to M. 70,000,000, it is evident that the showing for 1919 will be quite different.

It is reported that the Krupps Works does not intend to take up the manufacture of machine tools, but is selling those in its equipment which it does not need. It also is stated that the manufacture of textile machinery, typewriters, calipers, gages, and measuring instruments is being considered.

Since virtually no American tools have been coming into Germany for three years, of course, no American machine tool dealers now are in Germany. Even those who believe in American tools and would prefer to handle them, have been obliged to sell German, Swiss and Swedish products. The firm of Heinrich Dreyer has been liquidated and its fine show room now is occupied by Zimmerman-Werke of Chemnitz. Thielicke & Co., formerly in Charlottenburg, have their salesroom and offices at Kaiser Wilhelmstrasse 2, just across from Dryer's old location. Both Thielicke brothers were in the army, but came through with slight wounds. Schuchardt & Schutte are in the same location in Spandauer strasse. Oscar Burghardt, formerly manager of the Petrograd branch makes his headquarters here. Ernst Muller, formerly manager of the New York office, still is at Berlin in the same location as in 1914. Victor Giraud still is manager of the business.

German Dealers Resume Activity

Alfred H. Schutte has moved his Berlin wareroom from its former location in Alt-Moabit to Kroner strasse, 52, near the business section. Adolph Siems is still manager. E. Sonnenthal Jr. has moved to Ross strasse, 22. In addition to an extensive dealer's business, this firm has taken up the manufacture of lathes. Ernst Krouse of Vienna has opened a wareroom at Friedrich strasse, 123, principally for the sale of the product of his Vienna factory. He recently has been employing 400 hands in his Vienna factory, making lathes, drilling machines, Higley saws, planers and shapers and turret lathes. Mr. Krause recently bought a planer plant at Cologne, which he will

(*Concluded on page* 1180)

American Ideas Copied

GERMAN designers have made few changes in machine tools and few new machines have been brought out. On account of the tendency to copy American machines or to use their new points, manufacturers are cautioned about accepting first orders for such machines. Before the war, the German Machine Tool Makers' association had 72 members. The membership now totals about 320. *The members apparently work together for much the same objects that are before the members of the American organization, except that the German manufacturers are free to regulate prices to any extent they choose. The members of the German association employed about* 70,000 *men and a large number of women in* 1917 *while in* 1918-19, *about* 60,000 *men and fewer women were engaged. Makers of engine lathes in the organization number* 90; *vertical boring mills,* 13; *cutting off machines,* 20; *horizontal boring mills,* 27; *gear cutting machines,* 19; *turret lathes, screw machines and automatics,* 37; *milling machines,* 83; *drilling machines,* 43; *planers, slotters and shapers,* 44; *and grinding machines,* 40.—*Mr. Luchars.*

Schneider's—An Industrial Pillar

Great French Iron and Steel Works, Founded by Cabinet Member in Reign of Napoleon III, Proves Giant of Strength in Liberty's Cause—Glimpse of Organization Whose Head is Visiting the United States

BY FRANCIS MILTOUN
French Correspondent of The Iron Trade Review

THE visit to the United States of Charles Eugene Schneider, head of Schneider & Co., Creusot, France, as chairman of the French delegation to the international trade conference in Atlantic City last week, serves to recall the notable service rendered by the company's great iron and steel plants to the cause of liberty. Monsieur Schneider, who is president of the Iron and Steel institute, an office to which he was elected at the first meeting of the institute in London after the war, in recognition of his work in behalf of the allies as well as his ability in metallurgical and engineering fields, also has received honors in the United States. This year he received the gold medal of the American Mining and Metallurgical society for distinguished service. In this article, THE IRON TRADE REVIEW'S *French correspondent gives a brief history of the Schneider establishment and the extent of its operations since its foundation, a summary which will serve to point out the importance of the work of the distinguished French industrial leader who is now touring this country.*

WHEN Charles Eugene Schneider the famous French ironmaster was elected president of the Iron and Steel institute, at its first after-the-war convention in London, popular opinion in regard to the versatility and broad-mindedness of this chief personage of the French metallurgical industry was confirmed.

Schneider's has been a name to conjure with in French metallurgy for over a century, the establishment having been founded by Joseph Engene Schneider, an ironmaster of Bazeilles, who was minister of the legislative corps in the reign of Napoleon III, and a member of the emperor's privy council.

The business developed rapidly and by the middle of the nineteenth century it passed to the son of the founder, Henri Schneider (1840-1898). The present head, the son of Henri, became a partner on his majority and became the ruling power in the company on the death of his father, whom he also succeeded as a member of the French parliament.

Plant Well Equipped as War Started

A century of labor found the Schneider plant fully equipped for the responsible part they were to play in the great war. The chief handicap at the beginning of its labors in behalf of *la patrie* was the fact that the enemy occupied the Briey basin, from which it obtained a large part of its raw material. Finding it impossible to receive high-phosphorus iron from its Briey plants the company increased its facilities at the Creusot works in order to produce bessemer steel, and by the middle of 1915 it had succeeded in experiments which enabled it to produce shells of bessemer steel in a most satisfactory manner. This then became the chief production at Creusot.

At the end of 1915 another large steel plant was erected at Le Breuil, nearby, originally intended to contain four open-hearth furnaces. The first unit began pouring in August, 1916. Finally six furnaces, each of 60 tons capacity were in operation and later two 30-ton furnaces were installed. By the end of 1917 more than 1000 tons of ingots were produced each day.

Because of the increased demand for pig iron, a new blast furnace was fired at Creusot in 1915 and another in 1916. By the end of 1917 production of guns and ammunition at Creusot had increased 1000 per cent over what it was at the end of the first year of the war.

At the beginning of the war, Schneider put all his formulas and processes at the disposal of the French government. These were particularly valuable in the production of shell steel. The company assisted other plants which never before had to contend with such problems as were thrust upon them, and loaned its technicians to enable them to increase production with the least possible delay.

The company at this time acquired a working interest in the Société des Hauts Fourneaux et Acieries de Caen, whose plant had been idle since the opening of hostilities, and the subsidiary Schneider company, the Société Normande de Metallurgie, obtained the necessary authority for completing and bringing into production the Caen plant.

A mission of the Schneider engineers visited the United States with a view to having produced shells in accordance with Schneider specifications, a task successfully undertaken by the United States Steel Corp., and the Lackawanna Steel Co.

Recently it was announced that the company has acquired a controlling interest in the famous Skoda Works, at Pilsen, employing 30,000 workmen. This plant, formerly under Austrian control, but now under the Czecho-Slav government, has made an agreement with the Creusot firm of Schneider's, and the capital of 72,000,000 crowns will be increased immediately to 144,000,000. The new council of administration will include three French representatives and six Czecho-Slav members. The new president is M. Simoneck, a Czecho-Slav, and the vice president, Monsieur Schneider. The other French directors are Col. Henri Viel, and Mons. Victor Champigneul, engineer.

The Creusot works proper consist of a colliery, blast furnaces, by-product coke ovens, open hearths and mills capable of converting the entire production of ingots into armor plates, sheets and shapes. They also include foundries for steel, iron, and nonferrous metals, shops for building turbines, locomotives and ordnance.

Plant Includes Coke Ovens

The Henri-Paul plant, named in honor of the eldest son of Monsieur Schneider, is at Montchanin-les-Mines in the department of the Saône et Loire, and includes a bronze foundry, now undergoing considerable development, and a battery of by-product coke ovens.

The Breuil works, near Creusot, is a high efficiency steel plant, with 60-ton ton 30-ton open-hearth furnaces in operation.

The Havre, Harfleur et Hoc plant includes engineering shops for the production of marine and diesel engines and gun-proving shops and ranges.

The Chalon-sur-Saône works specialize on the building of steel bridges and small naval craft, submarines, torpedo boats, etc. The great Alexander bridge at Paris, one of the products of this plant, is considered in France as the

most artistic and durable of all steel bridges.

The Champagne-sur-Seine works specialize in electrical machinery. At La Londe les Maures, on the Mediterranean in southern France, is a torpedo plant, producing small electric motors. At Paris are shops for producing gunsights and similar equipment, and at Bordeaux is a plant producing cartridges, and manufactures made of light alloys. The company at Creusot is directly interested in coal mines at Decize in the department of the Nièvre, the Chaillac iron mines in the department of the Indre, and the Droitaumont iron mines in the department of Meurthe-et-Moselle.

The following figures give an indication of the size of the parent concern: Area of ground owned, 17,300 acres; horsepower, 200,000; machine tools in use, 5000; locomotives, 100; freight cars, 6500; track length, 200 miles.

Handling Costs in a Steel Foundry

BY CLIFFORD E. LYNN

PROBABLY the most essential step in securing accurate production records in a foundry is to have a check on the molder's daily time distribution slips. If the timekeeper is required to visit each molder personally at the close of the day to ascertain what has been produced, a check of the molder's verbal statement should be made. The best method of accomplishing this task without arousing the molder's antagonism is to have the foundry production clerk secure daily from each molder a statement of what he intends making, securing check number, pattern number, number of molds or piles, stamp number and date. He then places this information on a ticket shown in Fig. 5 which he passes to the molder, who places the tickets on each pile which may constitute one or more molds, before the heat is poured.

The production clerk precedes the ladles, as the heat is being poured, collecting all tickets from molds or piles, which the ladleman informs him he intends pouring. From these tickets he compies a daily-pouring record showing the number of the heat, date made, pattern number,

FIGS. 6 AND 7—TWO FORMS USED IN MAKING OUT FOUNDRY REPORTS

number of molds, pieces per mold, total number of pieces, stamp number and date of pouring. The form used for this record is shown in Fig. 4. At the end of each day he should visit each mold or pile, placing tickets on all left standing unpoured.

From a count of these molds or piles, a left-standing-on-the-floor record, shown in Fig. 6, should be made, showing date produced, molder's check number, pattern number, number of molds, pieces per mold and total number of pieces. The timekeeper or production clerk should enter on the form, shown in Fig. 2, in the production book daily the left-standing-on-the-floor record, heat pouring, and molder's report of castings produced, showing if any molds were broken in handling or slagged in pouring.

The daily left-standing and poured records should equal what the molder daily reports, as produced, minus molds broken or slagged. If it does not, the production clerk and timekeeper should investigate and correct any error made, before the daily production report, shown in Fig. 7, is made out and sent to the cost department.

The correct production is posted daily on time cards made out for the pay period and ruled to show date produced, pattern number, number of castings, molder's check and stamp numbers, molds broken, castings rejected by inspector, piece and day work, hours and rates per 100 pieces or hour. The productive and nonproductive hours are classified separately, showing hours spent on each job.

Classifications of castings, dividing bench, floor and machine, made with subdivisions are also recorded for benefit of the cost department. The scrap or open-hearth furnace charge is weighed, as is the finished casting, after it has been routed through the sand-blast department and inspected.

At the end of each month, which also is the end of the latter half pay period, an inventory of all molds left standing, poured and unpoured, or castings shaken out is taken by the production and time clerk, and marked old pay, so that the old and new pay are properly divided. It also is the duty of the timekeeper to record the time taken from clock cards, handle all transfers, employment slips, discharges and other matters effecting foundry employes. The production clerk issues requisitions on the store room for supplies and handles the foundry order book.

When an order is received from a customer, it is recorded by the order department and scheduled for production according to foundry conditions, priority, and date shipment is desired. When scheduled the order clerk orders the pattern for the foundry on the form shown in Fig. 3 and tags it with a number. He orders the quantity wanted, the size, etc., and sends a list of orders thus scheduled for stock or shipment to the foundry production clerk. The latter enters it in his order book on the form shown in Fig. 1, deducts the castings molded daily, adds the inspector's daily report of castings scrapped which have to be made over, and records castings passed as good. When the total of good castings made equal the quantity order, the order is considered completed.

Germany a Future Tool Factor

(*Concluded from page* 1177)

use for manufacturing machine tools. F. G. Kretschmer at Frankfurt-on-the-Main has been handling German tools during the war and has a large stock on hand. Both Mr. Koyemann and his associate, Mr. Huttner of Dusseldorf, were in the army during the most of the war, and are now re-establishing their business.

There are said to be some 60 automobile factories in Germany, but not more than a dozen are active, and only a few of those have been able to get sufficient material to turn out a normal product. Before the war few of these manufacturers produced cars as we do in the United States. It is said there were 190 different kinds of cars made. The financial outlook in Germany does not warrant large investments in the manufacture of either pleasure of business cars.

No definite policy has yet been decided on about the tariff, although it is said that a high protective duty will be placed on imports. The national assembly being only a provisional body, it is likely that this question will be left to its successor, but there is a marked tendency among those having authority, to arbitrarily shut out all American machine tools, except those types which are not made here.

There has been no change in the German patent law since 1909; and American manufacturers are advised to patent any improvements that are patentable, not only for their protection in Germany, but in other continental countries where German tools may be sold.

In what remains of Austria, the machine tool industry is on an uncertain footing, due to unsettled conditions and a debased currency. In Hungary, the new government is too young for anyone to venture an opinion about the future, except that any government must be an improvement over what Hungary has had lately. In Prague, business is said to be encouraging, and the Czecho-Slovak government apparently is growing in strength. Machinery dealers in Berlin also say they are doing a good business with Finland.

Everyone whom I saw in Germany was friendly and there is no animosity against Americans as individuals; but there is a strong feeling against us as a nation. The Germans say that if we had not come in they would have won the war, and they are not of the readily forgiving kind. This feeling will affect the sale of American machine tools and other products in the future.

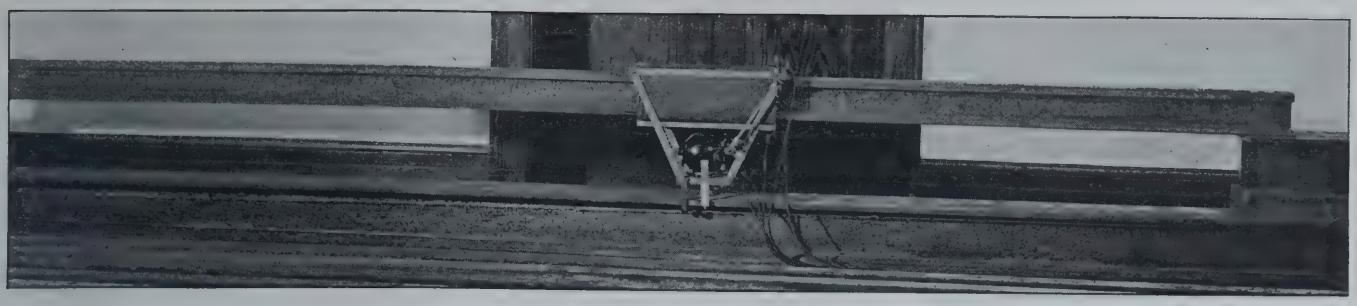

Fig. 1—Rail testing apparatus in laboratory of United States bureau of standards, Washington

Testing Steel by Magnetic Analysis

BY R. L. SANFORD

MAGNETIC analysis may be defined as the utilization of the magnetic methods for the study of the internal structure and mechanical condition of magnetic materials and in particular of iron and steel. It may be used to detect structural changes on heating or cooling or as an indication of mechanical properties. The results of magnetic analysis are to be interpreted in the light of the best available knowledge of the correlation between the magnetic and other properties of materials.

From a paper presented at the sixteenth general meeting of the American Iron and Steel institute, New York, Oct. 24. The author, R. L. Sanford, is associate physicist, United States bureau of standards, Washington, D. C.

Many physical and chemical methods for testing steel and steel products destroy the sample or render it unfit for the use for which it was originally intended. This fact has made necessary our present methods of vicarious testing. It is plainly evident, therefore, that any satisfactory nondestructive method which makes possible the comparison of each individual piece with one whose performance has been carefully determined and which thus serves as a standard of quality will have great commercial value.

The mechanical properties of steel are functions of its chemical composition and of its micro-structure and mechanical condition. The micro-structure and mechanical condition, such as internal strain, etc., are determined by the thermal history and the amount and kind of mechanical work that has been done on the piece. The magnetic properties of steel are likewise functions of the same variables and any change produced in one set of properties is accompanied by a corresponding, though not necessarily proportional, change in the other.

Fig. 3 shows graphically the relations between the quantities measured during the course of a complete magnetic test. If a magnetically neutral or demagnetized piece of steel is subjected to an increasing magnetizing force, the resulting induction

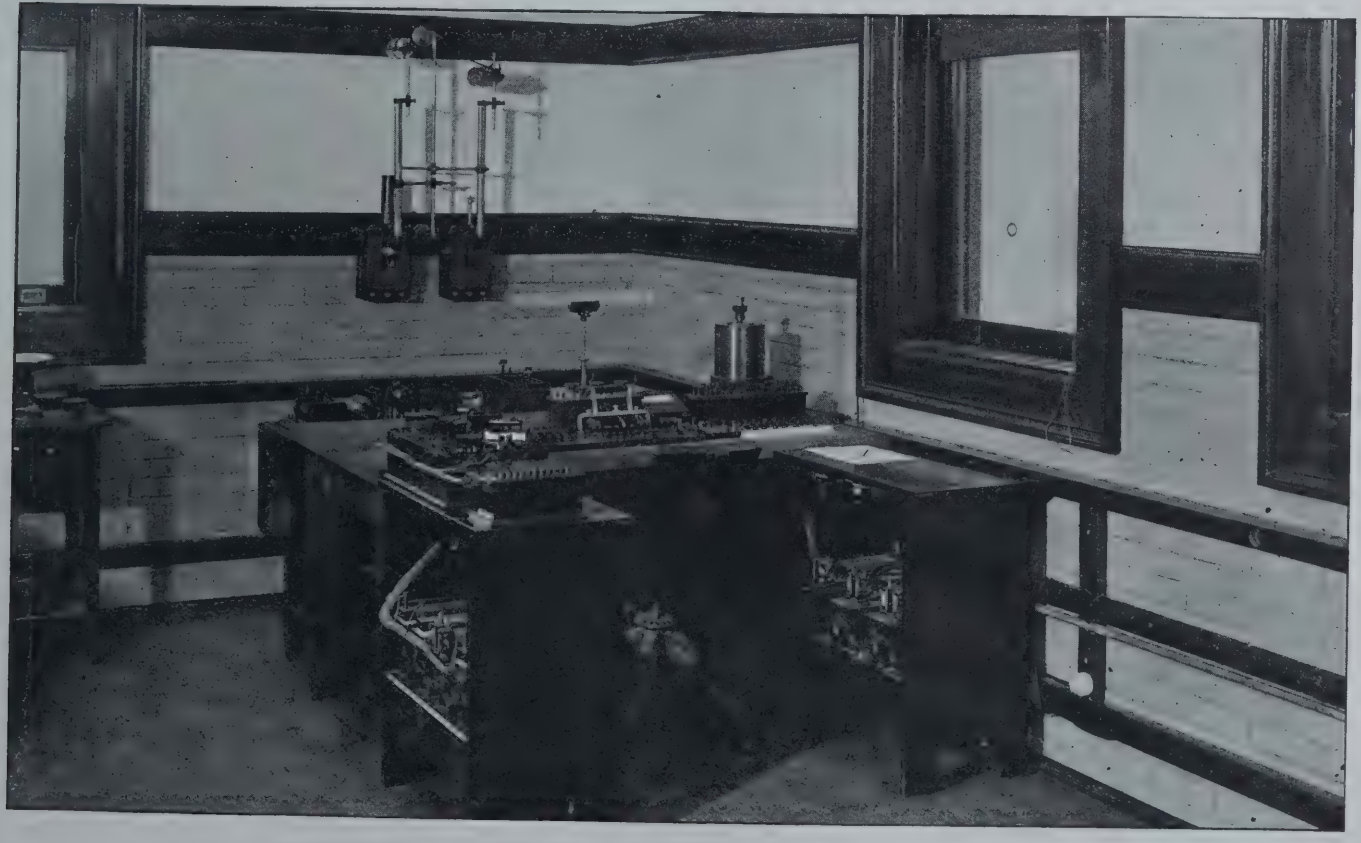

FIG. 2—PERMEAMETER APPARATUS USED IN CONNECTION WITH THE MAGNETIC ANALYSIS OF STEEL

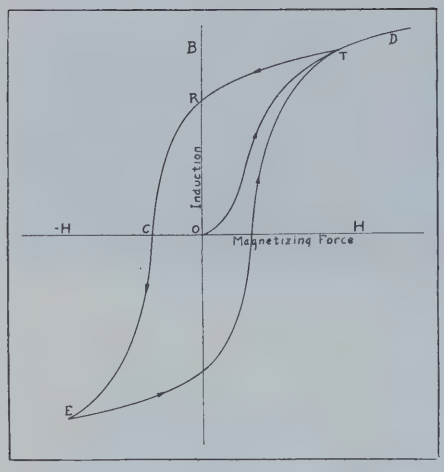

FIG. 3—SHOWING INDUCTION AND HYSTERESIS CURVES FOR STEEL

is indicated by the curve *OTD*. If the magnetizing force should only be brought up to the point *T* and afterward reduced, and then increased to the same value in the reverse direction, the curve *TRCE* is traced where values at the left of the axis represent magnetizing forces in the reverse direction. If the magnetizing force is again reversed, a closed loop is traced as shown. This loop is called the hysteresis loop and its area is proportional to the energy required to take the steel through a complete magnetic cycle. The value of induction corresponding to the point *R* is known as the residual induction and the value of reversed magnetizing force required to reduce the induction to zero, represented by the point *C*, is called the coercive force. The point *T* representing the maximum value of magnetizing force and induction for a given hysteresis loop is called the tip of the loop. The ratio of magnetic induction to the corresponding magnetizing force at any point on the curve *OTD* is called the magnetic permeability.

It is too long a story to present at this time in any detail the results of many experiments which have shown the existence of a close connection between the magnetic properties of steel and the factors determining its mechanical properties. We may consider three cases which are illustrative of the effect on the magnetic properties of chemical composition, hardening and tempering.

Fig. 6 shows the variation in permeability of annealed carbon steel with various carbon contents. It will be noted that the permeability varies through a rather wide range as the carbon content varies from 0.11 per cent to 1.8 per cent, decreasing as the percentage of carbon is increased.

The curves of Fig. 8 show the effect on the coercive force of drawing or reheating a 1 per cent carbon steel after quenching. Note the clear evidence of the cementite transformation in the case of the water-quenched steel which took place between 200 degrees and 300 degrees Cent. The transformation evidently took place during the quenching when oil was used as the quenching medium, due to the slower rate of cooling through the critical range.

While the evidence already at hand is sufficient to demonstrate that there is a very strict correspondence between the magnetic and mechanical properties of steel, these relationships are so complex, that up to the present time no definite laws have been worked out. Indeed it may prove extremely difficult, if not impossible, to completely define in terms of the magnetic properties of a substance all of its other physical properties. In spite of this apparently discouraging fact, we need not wait for the complete working out of all the correlations before applying magnetic analysis in a practical way.

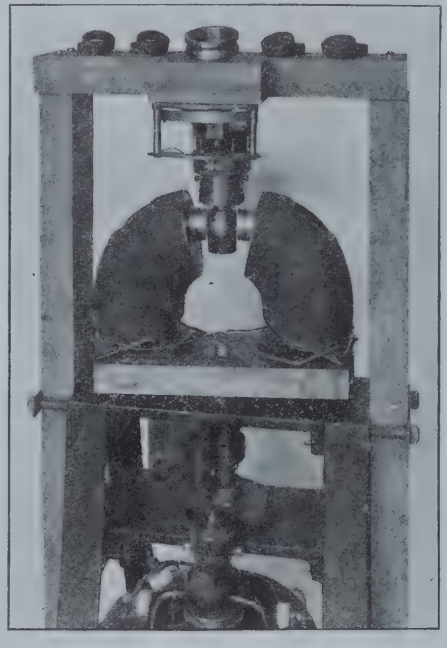

FIG. 4—EXPERIMENTAL APPARATUS FOR TESTING BALL BEARING RACES

The methods of magnetic analysis may be employed either by the investigator, as an aid to the solution of theoretical problems such as those arising in the study of the phenomena involved in the hardening of steel, or by the testing engineer, as a nondestructive method of test to supplement the methods already in use.

A laboratory such as that of the United States bureau of standards is admirably adapted to the study of this subject from the theoretical standpoint and the magnetic laboratory of the bureau is at present carrying on investigations of this nature.

FIG. 5—CRACKS IN BALL BEARING RACES DETECTED BY MAGNETIC ANALYSIS

This work is being done in co-operation with other divisions of the bureau and in particular with the division of metallurgy. This work is not yet sufficiently far advanced to present definite results, but they are very promising and indicate that the method may be expected to yield very valuable data which will serve not only to advance our theoretical knowledge, but also to provide a foundation on which practical applications may be based.

Fig. 2 shows a corner of the magnetic laboratory and the apparatus used for making standard tests of the magnetic properties of specimens of iron or steel.

For practical purposes, magnetic

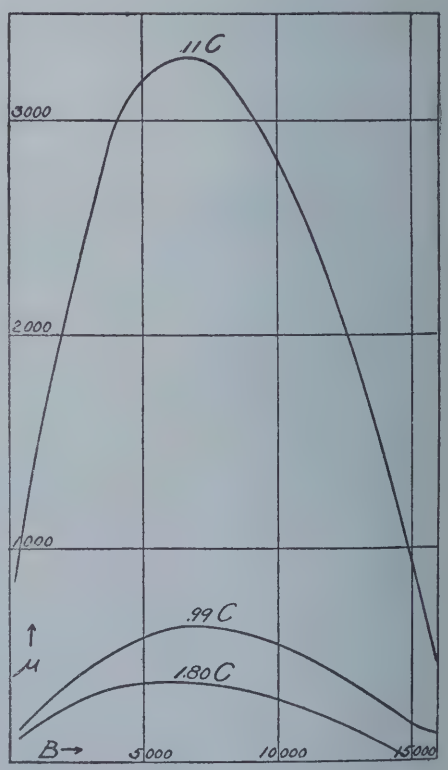

FIG. 6—VARIATION OF PERMEABILITY WITH INDUCTION FOR STEELS OF DIFFERENT CARBON CONTENTS

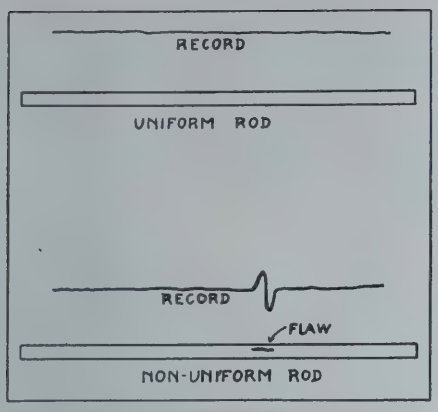

FIG. 7—TYPE OF PHOTOGRAPHIC RECORD SHOWING DEGREE OF MAGNETIC UNIFORMITY OF STEEL BARS

analysis has as its ultimate object the development of methods and instruments which can be used in the shop for the purpose of comparing the factory product with specimens which have been selected as standards of quality. At the present stage of development, each application must first be the subject of an individual investigation. The properties of the material must be studied, the magnetic criteria for quality must be determined upon and apparatus must be built for making the magnetic measurements quickly and accurately under shop conditions. After these steps have been completed, the final step is tried under actual service conditions to demonstrate that the method is sufficiently rapid, accurate and reliable to warrant its commercial use.

The magnetic laboratory has developed a method for determining the degree of magnetic uniformity along the length of a specimen of substantially uniform cross section. This method has been adapted to the study of steel rails. Part of the apparatus for testing rails is shown in Fig. 1. The test consists of surrounding the rail with a magnetizing solenoid which is run along the rail. A sensitive electrical instrument which is connected to a test coil carried with the solenoid indicates any change in magnetic permeability of the specimen as the coil moves along. The type of record obtained by photographic means is indicated in Fig. 7.

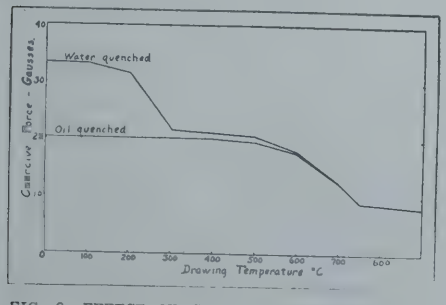

FIG. 8—EFFECT OF COERCIVE FORCE OF DRAWING 1.0 PER CENT CARBON STEEL AFTER QUENCHING

The greatest difficulty in this line of investigation lies in the interpretation of the results. This is due to the fact that there are many causes that may produce magnetic inhomogeneity, such as chemical segregation, strains, and flaws, and it is difficult to differentiate between them. The conclusions so far warranted are that a bar which is magnetically uniform along its length is also mechanically uniform, that a bar which is mechanically nonuniform along its length is also magnetically nonuniform and this nonuniformity will be surely indicated by the test; and finally that bars which are magnetically nonuniform may or may not be seriously defective from the mechanical point of view.

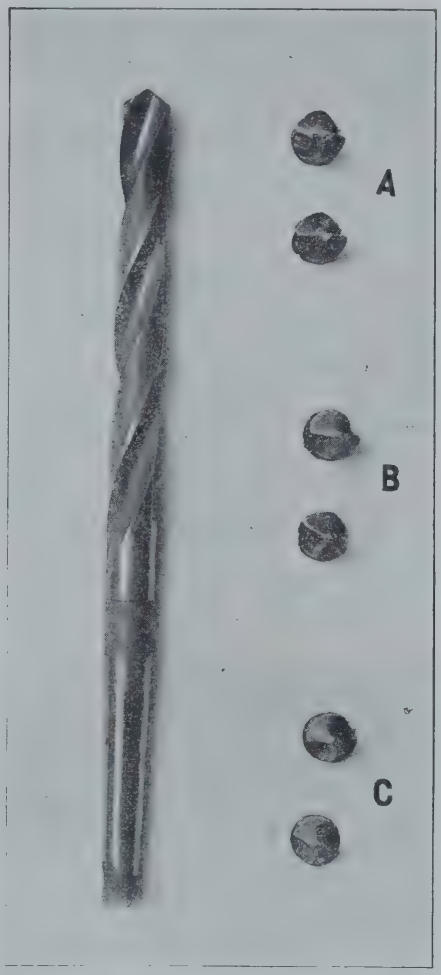

FIG. 9—RESULTS OF SERVICE TESTS ON TWIST DRILLS

This last conclusion points out the necessity for further investigation which is being carried out in cooperation with the ordnance department of the United States army.

A method is in process of development for the testing of ball bearing races. The work is not yet complete but it has been demonstrated that the apparatus is capable of detecting flaws, such as hardening cracks in the rings.

The apparatus used is shown in Fig. 4. The ring is mounted on a table free to rotate and magnetized between the poles of an electromagnet which also rotates. The rotation of the ring is opposed by a spiral spring. By means of a pointer and scale the torque exerted on the ring by reason of the rotation of the electromagnet can be measured. This torque is proportional to the energy required to carry the direction of magnetization of the ring through one complete revolution. It seems probable that this value may be used as an index in testing the rings. If the needle jumps during the rotation a crack or soft spot is indicated. The cracks shown in Fig. 5 were detected in this manner.

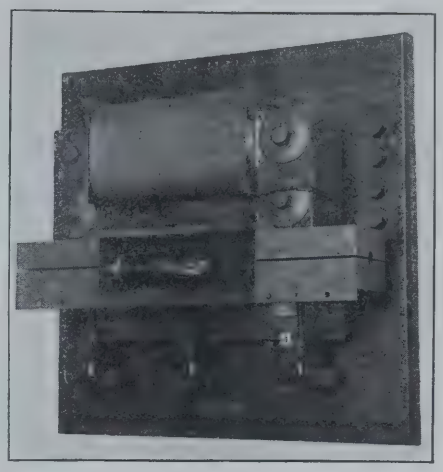

FIG. 10—EXPERIMENTAL APPARATUS FOR TESTING TWIST DRILLS

Fig. 10 shows apparatus used in preliminary experiments on twist drills. The drills shown in Fig. 9 were first given a magnetic examination and then drills *A* and *B* were subjected to identical service tests. The coercive forces for these drills were in the ratio of 3 to 2, the higher value indicating the better drill.

The work already done has furnished sufficient evidence of a very strict correspondence between the magnetic and mechanical properties of steel to warrant the conclusion that magnetic methods may be used to advantage in fundamental investigation and for nondestructive testing of steel products which obviously will have very great commercial value.

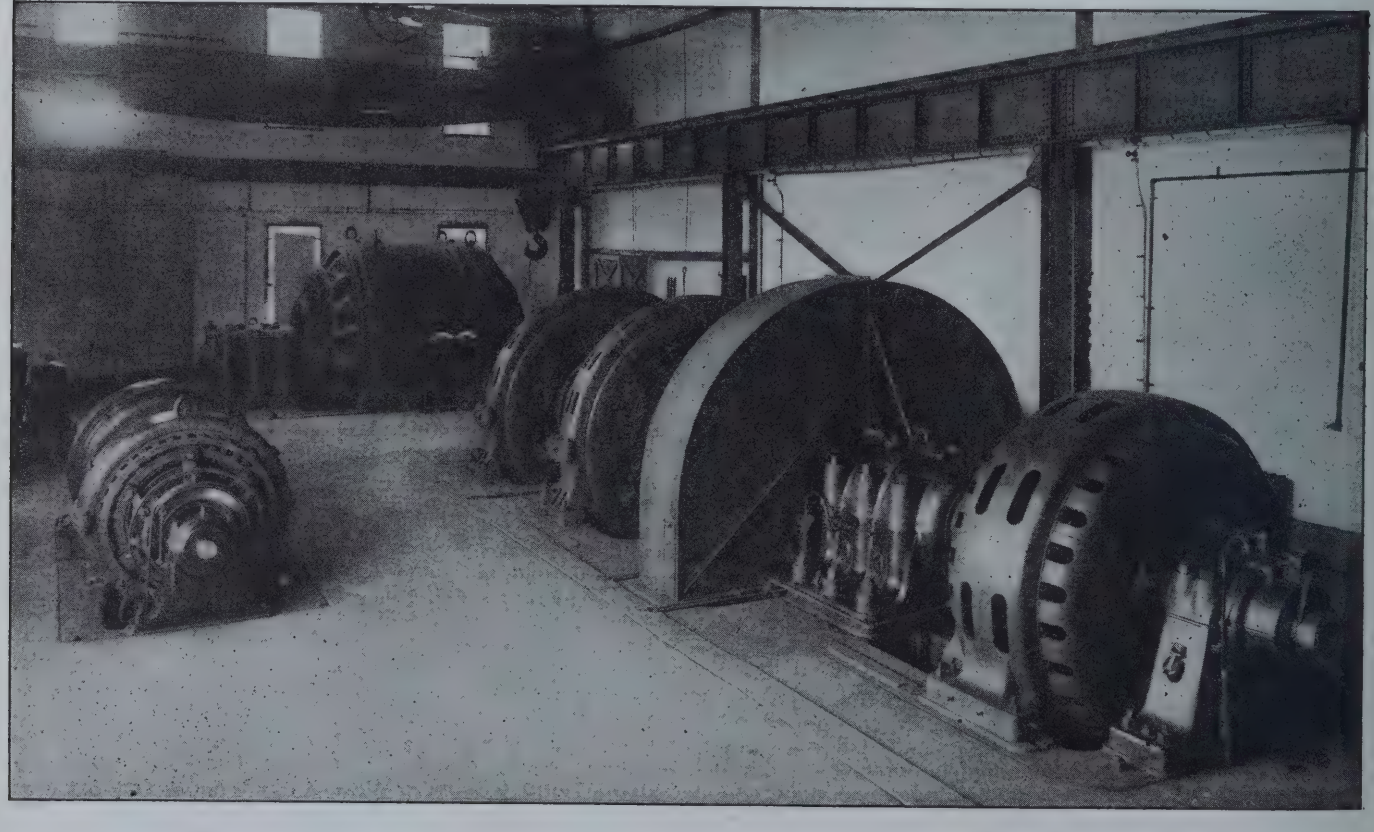
The future development of magnetic analysis must progress along the two lines of fundamental research and practical application since the proper interpretation of the results requires a full and complete knowledge of the existing relationships and this knowledge will have practical utility only as it is actually applied to the study and control of the structure of steel and the inspection of finished products.

Outlines Status of Electric Drive

Development of Electrically Driven Reversing Rolling Mills Has Been Rapid—Reversing Motor Has Been Used on All Types of Mills—Power Distribution is Economical and Flexible

BY WILFRED SYKES

WE ARE becoming so accustomed to the use of electric machinery in our daily life that sometimes the significance of the change from past practice is not appreciated. I believe this is true to some extent in regard to the electrically driven reversing rolling mill which has been quite extensively used in the last few years, and it is the object of this paper to review briefly the factors that led up to its development and to summarize the present state of the art.



The idea to use electric motors for driving rolling mills was first exploited in Europe where a number of small equipments were installed, beginning about 20 years ago. These were all used for driving mills running in one direction, and the machines were of the types already developed for other purposes. The ease with which the extension of the plant could be cared for, and the freedom from restrictions as to distance from the boilers was quickly appreciated, even before the economical advantages of electrification were realized. About 15 years ago, the number of machines installed had grown considerably, and about this time, a start was made in this country when two 1500-horsepower motors were built for driving the No. 3 rail mill at the Edgar Thomson plant of the Carnegie Steel Co. The problems involved in the design of such plants as Gary required a radical change from past practice, and the advantages of electric drive having been more clearly developed in the meantime, it was natural that electricity should be the medium for transmitting the energy from the power plant to the wide spreading mills which could then be distributed solely with regard to the proper handling of the material. Since then the development has been rapid and the majority of new mills in the last 10 years have had electric drive.

Production carries with it all questions of reliability, ease of operation and the fitting of the characteristics of the drive to the requirements of the mill. Economy covers all items of cost such as fixed charges, power cost, labor, maintenance, stores, etc., so that an answer to these two questions satisfies the usual mill man.

There is one other factor not quite so tangible, but of the greatest importance in the development of a plant, and that is the question of layout. With the use of electricity, we suffer no practical restrictions so that our plants may be laid out with regard only to the facility for transportation of materials and although this does not show itself directly in costs, when the plant as a whole is taken and compared with others, very gratifying results are obtained.

The reversing motor has been used for all types of reversing mills and to date has not found its limitations. Blooming mills, billet mills, plate

From a paper presented at the sixteenth general meeting of the American Iron and Steel institute, New York, Oct. 24. The author, Wilfred Sykes, is with the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

REVERSING MOTOR AND FLYWHEEL MOTOR GENERATOR SET IN PLANT OF STEEL CO. OF CANADA, HAMILTON, ONT.

mills and structural mills have all been electrified with success. The first installation put in operation 12 years ago at the South works of the Illinois Steel Co. drove a 2-high universal plate mill, and I feel that it is only proper to pay a tribute to the foresight and courage of those responsible for the decision to make this initial experiment. It remained for steelmakers in Canada to carry out the first successful blooming mill drive, and credit is due Robert Hobson, of the Steel Co. of Canada, for taking the responsibility of tying up his new plant to the comparatively untried electric drive.

The principal part of an electrical reversing drive is, of course, the motor connected to the mill. These motors are direct current machines and differ little in general characteristics from those with which we have been long familiar. There are, however, many special features that play a most important part and that spell the difference between success and failure. Of first consideration must be the mechanical construction and this must be beyond question. We must make a closer study of the details of construction than is usual to insure there can be no relative movement of parts under the severe shocks that the motor has to stand, and prudence requires that all parts be so strong that in case something must break about the mill, it will not be the motor. Together with this, we must keep our design balanced so that the weights of our moving parts are not excessive, as an appreciable amount of energy is required to accelerate and retard the motor itself.

The motor is not supplied with energy direct from the power plant, but through a so-called flywheel motor generator set. The function of this set is to provide means for controlling the speed and direction of rotation of the motor, and of equalizing the load on the power plant. It would be, of course, very difficult to build any type of controlling equipment that would handle the large current involved in motors of this type, as will be readily appreciated when we think of the flashing and noise made by the controllers for the motors driving the tables, screwdown, etc., which seldom exceed 100 horsepower, whereas our main motor may carry loads 100 times as great. The speed of the motor is proportional to the voltage impressed on it, and its direction of rotation depends on the way the current flows through it. By having a special generator to supply the motor, we can through the excitation of this generator, vary the voltage and the direction of the main current, and we need handle only about one-half of 1 per cent of the current in the motor. This is, of course, easily done and the control of our 10,000 to 20,000 horsepower motors is actually better than the control of the table motors.

The second function of our flywheel set is to prevent the terrific peak loads from the mill from being thrown on the power plant. If this were not done, it would be necessary to have large generating capacity running at very low average load to carry the mill. Fortunately, we can equalize the load to a great extent by a properly controlled flywheel which will give up energy during periods of great demand and absorb it during the intervals. For this reason, suitable flywheels are connected to the generators supplying power to the reversing motor and through the aid of suitable controlling apparatus, they are utilized so that the load on the power plant is only about one-fourth of the peaks on the main motor.

For driving the generator and flywheel, some kind of motor is required, and the type is dependent on the power system. This motor is only large enough to carry the average load and is not concerned with the peaks of the mill motor. The remainder of the equipment is for the purpose of controlling these functions and providing means for measuring and recording the power used. The starting and the control of the speed of the motor driving the set is done by the slip regulator, which automatically slows down the flywheels during peak load, thus causing it to give up energy, and accelerates it during intervals, thereby absorbing energy.

In regard to production, it is sufficient to say that investigations we have made of records show that electric drive in all cases is able to hold its own with the best of past practice, and there is ample evidence to show that with the elimination of restrictions in the mill, better performance can be obtained.

No one questions that the most economical method of making any article is to specialize the plant, installing the best equipment and manufacturing in large quantities. With reasonable distribution costs, such an establishment will eventually supplant the isolated small manufacturer. The whole history of our industrial development bears this out. And so it is with power generation. For economy we must concentrate our power equipment so as to utilize the best that science provides us with. By using large units, the greatest economy is obtained, and the relative labor and other costs are reduced to a minimum. If we then connect to such a power generating station all our power consuming devices, we will find that the aggregate required is less than the sum of the loads on the individual consumers. It is the same as having a diversified market for our products, a dullness of one locality is compensated for by a demand from another, and in this way our average output is maintained approximately constant, which is obviously the most economical condition. If we had to support individual factories to supply all local demands, we would in the aggregate have a capacity out of proportion to our total output. Efficient distribution is the solution in the case of our manufactures, and with power electricity provides the economical means for transporting our power to the consuming devices. The ideal we must work to is to generate our power wholesale and distribute it efficiently. Electricity provides us with a means of using the most economical prime movers, and the consuming devices can be driven with machines that will transform our wholesale generated power to mechanical work with a loss of only a few per cent.

With the experience now available, it is beyond question that our power distribution in the future will be by means of electricity, and we should lay out our generating stations with units of such size and characteristics in relation to the ultimate requirements as to get the best economy, and with such a margin of capacity that the electrification of our plants can take place as opportunity offers, without having to consider each time we desire to add a motor whether the generating plant will not have to be extended. We can then modernize our mills as changes are required and ultimately convert our wasteful methods of power generation of the past to the best that we have at present knowledge of. Great force is given to this viewpoint with the rapid rise of fuel and labor costs, two of the principal factors in our power costs. It is wise in this respect to consider the possibilities of ultimately tying different generating stations together for the material benefit of those concerned. In this way, power may be interchanged at times to advantage and the stand by value of such interconnection reduces the amount of spare plant required with the consequent savings.

Making Ingots for Rolled Wheels

Practice of Using Multiple and Individual Ingots for Locomotive Tires and Rolled Wheels is Well Established in America—Choice of Two Depends Upon Local Manufacturing Conditions

BY LAWFORD H. FRY

ALTHOUGH the processes of manufacturing railroad tires and wheels differ in detail, both products require a ring of sound steel as their starting point. Table 1 shows the chemical specifications of steel wheels as adopted by the American Society for Testing Materials. Class *A* tires are usually used for the large diameter driving tires for passenger locomotives; class *B* tires for drivers for freight locomotives, for locomotive truck and tender wheels, and for car wheels; and class *C* for driving tires for switching service. The large majority of tires are made from acid open-hearth steel, while rolled wheels are made from both basic and acid open-hearth steel. In view of the exacting nature of the service clean dense steel is essential, but with care in the steel making good results can be obtained with acid or basic open-hearth, or with electric steel.

In manufacturing these products the first step is to select an ingot or a portion of an ingot of a weight to make the tire or wheel, and, after heating, to compress this in the direction of its longitudinal axis at the same time punching a hole through the center. The resultant piece, which is commonly known as a bloom, is generally similar for tires or wheels except that for wheels the hole is smaller in diameter and in some cases the hub is partly formed in this operation. In the succeeding operation the bloom is formed into a blank in which the shape of the finished product is roughly apparent. A subsequent rolling operation completes the manufacture of tire or wheel. As a necessary part of the manufacture of tires or rolled wheels, the central core of the ingot is punched out and discarded. This point is of importance in connection with the use of individual ingots.

Types of Ingots

Ingots for wheels or tires usually are classified as multiple ingots and individual ingots. The difference lies in the fact that the individual ingot is cast of a size to make a single tire or wheel, while a multiple ingot is sliced, at right angles to its long axis, into a number of blocks each of which is formed into a wheel or tire. This slicing was formerly done by heating the ingot and shearing under a press or hammer, but is now generally carried out cold on a slicing lathe with multiple tools.

Metallurgically considered, the two types of ingots are differentiated by the principles involved in the elimination of piping and segregation. Multiple ingots are designed to concentrate these defects in the upper quarter of the ingot which is discarded after slicing the lower portion into blocks. Individual ingots are designed to eliminate piping almost entirely, to reduce segregation to a minimum, and to place these defects so that they are completely removed by the punching operation in the first process of manufacture.

It should be noted that in one process of wheel manufacture the bloom is formed, not directly from an ingot, but from a bar 12 or 14 inches in diameter rolled from an ingot and sheared hot into slugs of the proper weight. The ingots used in this process are rectangular in cross section, measuring about 20 x 27 inches. Such ingots are related to the other ingots used for rolled bars, rather than to tire and wheel ingots proper.

Cross Section of Multiple Ingots

Multiple ingots usually have an eight or 12-sided cross section with concave sides. The dimensions of a series of 12-sided ingots used by one tire manufacturer are given in Table II. The mold has 12 slightly concave sides, and with a nominal diameter of 17 inches produces an ingot about 94 inches long, weighing about 64 pounds per inch of length. Ingots of this type are made with diameters of from 10 to 30 inches, according to the weight of piece to be made. It may be noted that wheel weights average about 950 pounds while tire weights may run from 300 to 2000 pounds. Both makers, whose practice is illustrated in Table I, use acid open-hearth steel, bottom pouring, and hot tops on the ingots. This is a bottom poured, flat sided, octagon ingot which has been sliced hot in blocks *A, B* and *C*, each of which will make one tire. The unlettered section is the discard necessary to do away with piping and segregation. The discard from the ingot amounts to approximately 20 per cent of the ingot weight. The amount of discard necessary can be reduced by using some forms of hot top by which the head of the ingot is kept hot and fluid until the greater part of the shrinkage in the body has taken place. The upper part of the ingots has been sectioned on the longitudinal axis. The ingots cast without hot top have a pipe extending throughout the upper 20 to 25 per cent of their length. Sometimes ingots have their upper portions protected from contact with the iron mold by a heat-insulating jacket, and, in addition, a layer of carbonaceous material was applied to the ingot top immediately after pouring. Piping has been eliminated and a discard of 10 per cent would be sufficient to remove all segregation and to leave only sound useable steel. In practice it is more convenient to keep the mold of uniform diameter and to insert a brick or sandhead to provide insulation, or to make up a sandhead in a cast-iron casing placed on the top of the mold.

While the use of multiple ingots is fairly well generalized, the use in America of the individual ingot for tires and wheels is confined at present to the Standard Steel Works Co. Ingots of this type are octagonal in section and are currently made with diameters of 12, 14, 16, 18, 20 and 22 inches across the flats. The heights poured in each diameter range from about 60 to 100 per cent of the diameter. This with the six previously mentioned diameters gives ingot weights ranging from 250 to 1900 pounds, each ingot being of a weight to produce a single tire or wheel.

Top Cropping is Eliminated

The distinguishing feature of the individual ingot is the fact that it does away with all top cropping, the only discard necessary being the central core removed in punching the bloom. This is less than 3 per cent of the weight of the ingot. This result is obtained by eliminating piping and concentrating segregation. The steel is practically solid throughout. This solidity is the result of maintaining the top of the ingot fluid so that it can follow all shrinkage as it takes place and prevent the formation of cavities. To se-

From a paper presented at the sixteenth general meeting of the American Iron and Steel institute, New York, Oct. 24. The author, Lawford H. Fry, is with the Standard Steel Works Co., Burnham, Pa.

cure satisfactory ingots it has been found necessary to have well-made, dead-melted steel; to have a properly designed mold, and to apply a suitable carbonaceous material to the top of the steel as soon as it is poured.

Improvements in Design

Since the introduction of the individual ingot further improvements in its design and manufacture have been made. The circular cone section has been replaced by an octagon cross section with a straight vertical side and the material now used to keep the top hot is a special compound described below. Many investigations of the short octagon ingots made with pipe eliminator have shown that the freedom from piping is typical and can be secured in regular practice. Segregation is also confined within satisfactory limits.

Individual ingots have been made with both acid and basic open-hearth steel, and could be made with electric steel if occasion arose. This is not equivalent however to saying that "any steel will do." It is essential that the steel be well made, properly deoxidized, and dead-melted, without any tendency to "wildness" or boiling. That is to say the evolution of gas by the steel in the mold must be reduced to a minimum. The ingots should be carefully inspected for piping, rough tops or other defects. In particular any ingots showing signs of having boiled or risen in the mold should be rejected as they will be honey-combed to a dangerous extent. If the open-hearth practice is kept up to the mark and care is taken with the pit practice, indvidual ingots can be made to pass the necessarily severe inspection with rejections well under 1 per cent.

In a good mold it is important to have the walls thick at the base and thin at the top so that the chill effect is greater at the base, and cooling progresses from bottom to top of the ingot. It is also essential that the height of the ingot should be in proper proportion to the diameter. If the ingot is too flat the segregated area will be wide compared with the punch diameter, while too high an ingot will tend to give excessive piping. It has been found desirable to keep the height between 60 and 100 per cent of the diameter of the octagon.

A satisfactory material has only been arrived at by a continuous process of trial and elimination. In the manufacture of multiple ingots with hot tops, it has long been a common practice to add powdered coke, charcoal or coal to the upper surface. In the case of such ingots where a considerable discard is made so as to reject recarburized metal, satisfactory results can be obtained with such materials. In the case of individual ingots, however, the problem is much harder. The work required of the material is complex and the difficulties encountered with other materials have been such as to narrow the choice to the compound, known as pipe eliminator.

The material used must keep the ingot top hot and at the same time leave it with a smooth uniform surface. It must also prevent a recarburization of the surface. It has been found that to give these results the pipe eliminator must be finely divided and must carry a small amount of volatile matter so that it will ignite rapidly on application to the steel. There must also be present sufficient inert material or ash, which, after ignition, forms a blanket between steel and eliminator preventing undue absorbtion of carbon by the steel. It is further necessary to have a considerable proportion of slow burning fixed carbon so that the top is maintained hot during the solidification of the ingot.

Open-Hearth Pit Practice

When the pouring conditions are considered it is obvious that there is a good deal of difference between the "set-up" for bottom-poured, multiple ingots weighing from 5000 to 12,000 pounds, and, individual top-poured ingots with an average weight of about 900 pounds. The grouping of the long, bottom-poured ingots is well known, but the arrangement of an open-hearth pit floor adopted for this practice may be of interest. The ladle of 50 tons capacity is carried on a gantry so as to just clear the ingot molds, which are set up on five lines of base plates. The height is kept as low as possible to avoid splash. The ladle has two stoppers spaced to correspond to the base plates, so that with two operators a brace of ingots can be poured at once.

Accurate Weight is Essential

The base plates are carefully inspected and any defective bottom bricks repaired or replaced; molds of the size ordered are set up and a chalk mark made on the inside of each to show the height to which the steel is to be poured to give the weight required; the steel is poured to the chalk mark, and a scoopful of pipe eliminator added; when the ingots have set, the molds are lifted off and as soon as the ingots are cold enough to be magnetic they are transferred by magnet to the classifying shed. Accuracy in the weights of the ingots is essential and with an average weight of about 900 pounds the tolerance allowed is 10 pounds under and 25 pounds over the ordered weight.

At the annual meeting of the Wright-Martin Aircraft Corp., President George H. Houston said that 47,644 shares of the 500,000 shares of preferred outstanding had been deposited in favor of the consolidation plan with the International Motor Truck Co., New York. Of the common stock 746,908 shares of the outstanding 897,000 have been deposited

---

The Mercer Motors Co., a newly formed Delaware corporation, has purchased the plant of the Mercer Automobile Co., Trenton, N. J. Emlen S. Hare, of New York City, formerly vice president of the Packard Motor Car Co., of Detroit, is president of the new corporation. The new company has an authorized capitalization of 110,000 shares of common and no preferred stock. It will provide $1,000,000 additional capital for the expansion of the Mercer plant.

Applying X-Ray to Study of Steel

Practical Application of Metal Radiography in the Workshop is Limited to About 1½ Inches of Steel, But for Purely Research Purposes Greater Thicknesses are Possible of Examination

BY W. E. RUDER

IN 1915 Dr. W. P. Davey described his investigation of a steel casting by means of X-rays and showed that flaws of certain kinds, such as blow-holes or fair sized slag inclusions, were readily discernible. Since that time much interest has been shown, both in this country and abroad, in the practical application of this new tool.

What Are X-rays?

X-rays are ether waves or vibrations of very short length (.000,000,048—.000,000,036 millimeter) produced by the impact of cathode rays upon any substance. Cathode rays are streams of negatively charged electrons given off by the cathode under the action of high voltage and under conditions most favorable to ionization. These conditions may be that of a rarefied atmosphere (.006—.001 millimeter Mercury) or of a heated cathode in a very highly evacuated tube. Each electron in the cathode stream sets up a magnetic field perpendicular to its path, and the very rapid retardation of these electrons as they strike a substance (an X-ray target, for example) sets up electro-magnetic disturbances or other waves of short length, and consequently great penetrating power. These are called X-rays. Rays produced in this manner have the power of producing fluorescence from certain salts of the alkali and alkali-earth metals, of ionizing gases, of affecting the electric resistance of a selenium cell, of producing physiological effects in living tissue, and of affecting the photographic plate in much the same manner as visible light.

Waves of very short length are usually spoken of as "hard" and the longer ones as "soft." Hard rays have the greater penetration and for this reason high voltage is required when penetration is the primary consideration. In making a radiograph, however, not only is the penetration important, but the time of exposure is directly dependent upon the amount of X-rays that reach the emulsion. The intensity of radiation diminishes as in the case of visible light rays, with the square of the distance from the point of source to the surface of the object to be radiographed.

When visible light rays fall upon a transparent body, only a certain percentage of the rays pass through. Some are absorbed and others are reflected. Just so in the case of X-rays. Part of the impinging rays are reflected, that is, characteristic rays are produced, the incident rays setting up a secondary radiation characteristic of the substance upon which they fall. The second part is absorbed or scattered and so dissipated. Characteristic rays are produced only when the incident primary rays are more penetrating than the characteristic secondary radiation and their production is analygous to the production of fluorescent light.

Scattering is produced by deflection of the rays by internal structural surfaces in matter of any kind and increases with the thickness and atomic weight of the scattering medium. It corresponds to the scattering of visible light by fog. It is, then, this scattering and production of secondary radiation that puts such narrow limits upon the use of X-rays in examining substances, particularly those of high density, such as are encountered in radio-metallography.

Bearing in mind the foregoing brief survey of the underlying principles governing the application of X-rays, let us now consider their application to the study of metals.

Examinations Are Limited

Unfortunately we are, at present, limited in examining metals by means of a fluorescent screen, such as is used by physicians, to about 0.01 to 0.02 inch thickness of metal, and obviously, internal flaws in such thicknesses would be relatively unimportant. For the examination of a manufactured article, for the inspection of assembly, the screen has been successfully used. For most purposes, however, a photographic plate must be used so that the cumulative effect of time may be utilized.

The time of exposure is appreciably shortened by the use of an intensifying screen, a fluorescent surface placed close to the plate and which under the influence of X-radiation, emits visible light rays of a color which readily affect a photographic plate. In metal radiography the use of such a screen is a necessity, owing to the thickness and high atomic weight of most metals. Calcium tungstate, which emits a blue light under these conditions, is particularly suitable for the purpose. It must, however, be of very fine grain because this grain shows up in the negative.

What Radiographs Are

Radiographs are *detail shadowgraphs* and as the rays cannot be focused as in ordinary photography, the image will always be "life size" or larger. Moreover, the rays producing the shadows are not parallel but emanate from a point source. For this reason variations in intensity caused by differences in density in the object will be sharper when near the emergent side, and their sharpness will diminish and their size apparently increase as they are nearer to the incident side. This point-source distortion is diminished by increasing the distance of the tube from the object, at the same time, however, decreasing the intensity of the rays.

Most important, however, is the protection of the operator from the action of both the direct and secondary rays. Owing to the high penetrating power of the rays used, protection is even more important in metal radiography than in radio therapeutics. Too great care cannot be taken to guard against these rays. Complete protection should always be provided for.

A suitable arrangement for the making of radiographs consists of a camera which is merely a special plate holder, light-tight, of course, and carrying an intensifying screen. The object is placed on this camera directly. If the sides are not parallel, unsatisfactory results, due to unequal penetration, will result. In the case of curved surfaces, a film and flexible screen must be used.

The distance between the X-ray

From a paper presented at the sixteenth general meeting of the American Iron and Steel institute, New York, Oct. 24. The author, W. E. Ruder, is research metallurgist, General Electric Co., Schenectady, N. Y.

tube and the object is so regulated that a uniform effect may be obtained over the whole plate. For a 5 x 7-inch plate, this distance should be at least 15 inches.

The time of exposure is the most important consideration and has, unfortunately, been given little attention in previous publications. It is particularly desirable in investigating a new field, that all data be given. In this case, voltage, current, distance from plate to tube, time of exposure and kind of plate should be recorded.

Now it is evident that, provided the voltage is high enough to cause even a small amount of radiation to pass through the metal, a radiograph can be obtained if sufficient time is allowed. The time required is also a direct function of the intensity of the rays, that is, of the current passing through the tube. The exposure may then be referred to in terms of milliampere-minutes at a certain spark-gap (voltage). The limit of milliampere-minutes a tube will stand is determined by the temperature of the target and the heating of the bulb. Most tubes, unless special arrangement for cooling is provided, will carry only five or six milliamperes continuously, at the voltage required for this work.

M. H. Pilon describes an experiment in which he successfully radiographed 2.16 inches of steel by an exposure of 2 hours and 48 minutes, using a Coolidge tube operating at six milliamperes and 120,000 volts.

Davey, experimenting with 150,000 volts was able to detect defects $\frac{1}{64}$-inch thick in 1½ inches of steel with a 60 milliampere-minute exposure, while a 90 milliampere-minute with 130,000 volts was sensitive to not less than $\frac{1}{32}$-inch difference in the same total thickness.

With the best apparatus at present on the market, the metallurgist will be limited to the use of a 10-inch (100,000-volt) spark gap. This will require an exposure of about three hours at five milliamperes to radiograph 2 inches of metal. This represents the present practical limits of the process. Of course, for purely research work, much higher voltages are available and have been used, making the practical radiography of greater thicknesses of steel a thing to be reasonably looked forward to, but for the present, this is still in the hands of the X-ray tube engineer.

A difference of from 50 to 75 per cent in time of exposure may result from different density of the metal and from the character of the defects it is desired to show.

In developing an X-ray plate, a slow developer must be used, due to the fact that the emulsion, usually thick and carrying a high silver content, is affected all the way through. Too rapid developments would fog the surface and the negative would lose sharpness.

The relative depth of flaws may be determined either by radiography from two points and calculating the depth or by making a stereoscopic radiograph. Owing to the severe requirements in the matter of high voltage, currents and long continued operation, the hot cathode or high vacuum tube gives the most satisfactory results, in metal radiography.

The examination of forgings for flaws presents greater difficulties than castings because such flaws usually occur as hair line cracks or lines which, unless they happen to run almost parallel to the path of the rays and in a straight line, would not be visible on the negative. Even under these favorable circumstances, differences in density due to these defects are difficult to detect, for the radiograph does not enlarge and shows only such defects as would be visible if exposed to the naked eye.

In order to determine the thickness of the smallest air inclusion which could be distinguished radiographically, two plates of steel were machined and ground to flat surfaces. In one of these a slot was cut to give a wedge of air of varying thickness. Each plate when finished was $\frac{5}{8}$-inch thick. The two steel plates were then bolted together and radiographed at 15-inch gap. In this manner it was found that an air inclusion 0.021-inch could be detected in 1¼ inches of steel and an air inclusion 0.007-inch could be detected in a total thickness of $\frac{5}{8}$-inch of steel. This is, of course, under the most favorable conditions, when it was known beforehand that the inclusion existed and just where it was.

A similar experiment made with a radiograph. In this case a total thickness of ¾-inch was used, and we find that when the inclusion is near the plate a thickness of 0.014-inch may be distinguished when $\frac{1}{8}$-inch from the plate a slightly greater thickness is necessary and when on the side away from the plate the air inclusion must be at least 0.030-inch thick and be detected under the most favorable conditions.

X-Ray Supplements Magnetic Testing

BY HENRY M. HOWE

TWO distinct fields for magnetic testing was brought out by R. L. Sanford in his paper entitled "Testing Steel by Magnetic Analysis," which is found on page 1181. First, a magnetic comparison between rails, eye-bars or other products which we do not wish to destroy on one hand, and test pieces cut from crop ends which we do destroy by means of our tensile and impact tests. Each lot is accepted or rejected, as a whole, on the destructive test physical of coupons or other test pieces. Then each rail, eye-bar, etc., of the lot is tested magnetically and without injury in comparison with those test pieces. Any rail, which differs magnetically from the test piece, is either rejected or re-treated, or subjected to special scrutiny. This test should detect any deviations in the rails from the quality of the test piece, caused either by heat treatment, mechanical treatment, segregation or error in composition.

Second, a uniformity test, applicable most easily to pieces of uniform cross sections like rails, wire, cables, etc. These may be passed rather rapidly by the magnetic testing device, which should indicate all important flaws and inclusions. Any suspicious rails or parts can then be examined exhaustively, perhaps by X-rays, resonance tests, or by electrical resistance tests, and in extreme cases even by density tests.

To apply either of these magnetic tests to the forging, prior to machining, might save a great loss of time and money, by preventing the machining of defective forgings. Though such tests should be applied most easily to pieces of uniform cross section, they might easily be modified so as to apply to those of varying section. A single master piece, such as a gun forging, proved by exhaustive

Experts Read Papers Before Institute

WILFRED SYKES
Westinghouse Elec. & Mfg. Co., East Pittsburgh

WILFRED SYKES, who presented a paper on the electrification of reversing steel mills, is in charge of the marine and steel-mill work of the general engineering department of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. He has been associated with the Westinghouse company since 1909, and is regarded as an authority on matters pertaining to electrical hoisting and the electrification of rolling mills, mines and similar lines of industry. He is a native of New Zealand and is a graduate of the Technical college of Melbourne, Australia. Before coming to this country he was associated with Knox, Schlapp & Co., Melbourne; Shoerker & Fischer, Melbourne, and the Allgemeine Elektricitate Gesellschaft, first at Melbourne and later at the Berlin office of that company. Recently Mr. Sykes has been doing extensive work in connection with electric ship propulsion.

* * *

RAYMOND L. SANFORD, who presented a paper on magnetic analyses of steel, is secretary of the committee on magnetic analysis of the American Society for Testing Materials, an associate physicist at the bureau of standards, Washington, and chief of the magnetic laboratory at the bureau. Mr. Sanford, who is 35 years of age, has been with the bureau since 1910, following two years as instructor in physics and electrical engineering at the University of Vermont from which he was graduated with the degree of bachelor of science in electrical engineering in 1907. His work in research and testing won for him position of chief of the magnetic laboratory on July 1, 1918. Mr. Sanford developed a method for determining the degree of magnetic uniformity along the length of a steel bar, the results of which were published by the bureau of standards in 1916.

subsequently designed and built the works of the Orford Nickel & Copper Co., at Capelton and Eustis, Canada, and also those at Bergen, N. J.

* * *

GEORGE K. BURGES, who presented a paper entitled "Temperature Measurements in Steel Furnaces," is chief of the division of metallurgy, bureau of standards. Before becoming a metallurgist he was a physicist, and his early training has proved of inestimable value in his present work. Since the establishment of the metallurgist division in 1913, 10 years after he became connected with the bureau, Dr. Burgess has been endeavoring to find the foundation of physical principles in metallurgical problems. Before joining the staff of the bureau he devoted two years as instructor in physics in the University of California, and one year in the University of Michigan. He studied the subject for two years in Paris, and for two additional years in a post graduate course at the Massachusetts Institute of Technology. His research work is known to many steel manufacturers. He is endeavoring at present to obtain action by a committee of steel makers and consumers toward determining the phosphorous and sulphur limits in all grades of iron and steel.

Give Results of Their Research Work

W. F. RUDER
Research Metallurgist, General Electric Co.

W F. RUDER, who read a paper on X-ray examination of metals, is a specialist in the manufacture and heat treatment of sheet steel for magnetic purposes. He was born Dec. 22, 1886, in Stockdale, Pa., was graduated from the Pennsylvania state normal school in 1903, and from the Pennsylvania State college in 1907 with the degree of bachelor of science, in electrical engineering. Since 1907 he has been in charge of metallurgical research at the research laboratory of the General Electric Co., Schenectady, N. Y., and also is in charge of the development of magnetic materials, transformer department, General Electric Co., Pittsfield, Mass. He is a member of six metallurgical committees of the National Research council. His publications include "Grain Growth in Metals," "Metallurgy of Arc Welding" and "Colorizing of Metals."

* * *

LAWFORD H. FRY, who presented a paper on the manufacture of ingots for locomotive tires and rolled wheels, is associated with the Standard Steel Works Co., Burnham, Pa., and has had considerable experience in this department of the steel industry. He submitted some interesting data on tires and steel wheels and chemical analyses as shown by his experiments. The practice of using multiple and individual ingots for locomotive tires and rolled wheels is well established in America, he said, the choice of the two depending upon local manufacturing conditions.

* * *

VAN H. MANNING, director of the bureau of mines, described the work of the bureau in co-operation with the iron and steel and coal industries, his paper being in the nature of a summary of the work accomplished by the bureau since its establishment nine years ago. The purpose of the bureau is to conserve life and health and prevent unnecessary waste of the mineral wealth of the country, and

VAN H. MANNING
Director, Bureau of Mines, Washington

while some research work has been done along the line of preventing accidents at blast furnaces and in steel mills, the bureau has concentrated its efforts at mines, and especially at coal mines. Mr. Manning said the iron and steel industry itself is rendering an invaluable service in accident-prevention work. In its research work in the conservation of minerals, Mr. Manning said the bureau is hopeful that some means will be found for the beneficiation of low-grade iron ores, as it is estimated that the present supply of iron ore available for commercial use is sufficient only for 30 years.

X-Ray Supplements Magnetic Testing

(*Continued from page* 1189)

tests to be sound, and of the desired composition and thermal and mechanical treatment, would give a master curve in the comparison and uniformity tests. All duplicates of this forging should give curves like this master curve, and all which do not should be retreated, retested or rejected. Steel intended for surgeons' instruments, might well be tested magnetically.

I have in passing suggested the X-rays as supplementary to the magnetic tests. This would seem to be their proper function. The whole product of a mill could be tested magnetically with little cost, whereas the X-ray test is so tedious that it should be applied only to parts already shown by other means to be suspicious, and to pieces of such importance that every precaution should be taken to detect defects.

I found great interest in X-ray testing in England, where I attended a very enthusiastic meeting of the Faraday society, called by Sir Robert Hadfield and devoted wholly to this subject.

The X-rays thus far give nothing but a shadow test, which can detect small inclusions and flaws only in case they are in the immediate neighborhood of the photographic plate, and hence, only when they are near the surface of the piece. Large inclusions and flaws nearer the center of large pieces should be detected more readily by other means.

None of these tests promises to be able to detect alumina resulting from the use of aluminum, for this is likely to form thin discontinuous films, which in rolling and forging, become distributed rather evenly. Its infusibility prevents its coalescing into considerable masses. Should not its use in making important products on which life depends be forbidden with severe penalties?

Labor Seeks Union Domination

Open Shop is Focal Point of Labor Problem—Labor Group Would Abolish Workers' Organizations Not Affiliated With Federation—Unorganized Employers Must be Represented—Bolshevism Must Go

BY E. H. GARY

THE attention of the members of the American Iron and Steel institute has of late been focused on the attempt of leaders in the American Federation of Labor to unionize the iron and steel industry of this country.

The present campaign was started at St. Paul, June 13, 1918, by the adoption of a resolution introduced by delegate W. Z. Foster, couched in the following language:

"WHEREAS, The organization of the vast armies of wage earners employed in the steel industries is vitally necessary to the further spread of industrial democracy in America; and

WHEREAS, Organized labor can accomplish this great task only by putting forth a tremendous effort, therefore, be it

RESOLVED, That the executive officers of the American Federation of Labor stand instructed to call a conference, during this convention, of delegates of all international unions whose interests are involved in the steel industries, and of all the state federations and city central bodies in the steel districts, for the purpose of uniting all these organizations into one mighty drive to organize the steel plants of America."

The movement appears to have proceeded, under the general direction of Foster, without much result until June 13, 1919, when another resolution was adopted by the American Federation of Labor at a meeting held in Atlantic City, which reads as follows:

"WHEREAS, Every labor union in America, regardless of its trade or industry, has a direct and positive interest in the organization of the workers in the iron and steel industry, because the accomplishment of this vital task will greatly weaken the opposition of employers everywhere, to the extension of trade unionism and the establishment of decent conditions of work and wages; and

WHEREAS, The organizing force now in the field working upon this vast project is altogether inadequate in strength to carry on the work in the vigorous manner imperatively demanded by the situation; therefore, be it

RESOLVED, That President Gompers of the American Federation of Labor, and Chairman of the National Committee for Organizing Iron and Steel Workers, be authorized to call a conference, during the convention of the American Federation of Labor of all international unions affiliated with the A. F. of L., to the end that they make arrangements to lend their assistance to the organization of the iron and steel industry."

President Gompers thereupon named the heads of 24 affiliated organizations to act as a committee to develop and carry out plans for unionizing the iron and steel industry pursuant to the resolutions mentioned. You are familiar with what has occurred since that time and you are more or less acquainted with the history of the different union leaders who have been connected with the attempt to enlist the employes and to bring about a strike in the manufacturing works. The strike, which has been directed by the union labor leaders and was begun, so far as I am informed, without any request or authorization from the workmen themselves, has been conducted in the usual way. Immediately preceding the day fixed for ordering out the men, intimidating letters, large numbers of them being anonymous, were sent to the families of the workmen threatening physical injury to the father or husband, damage to or destruction of the home and kidnapping of the children unless the employe referred to should obey the order to strike. A number of the workmen, who had joined the unions voluntarily, accepted the order to strike and others remained away from the factories through fear. In many, if not most of the mills, the larger number of employes continued to work without interruption. At the beginning many of the workmen who attempted to continue their work and others who had remained at home through fear and attempted to return, were confronted in the public streets and elsewhere by strikers, or pickets, and importuned to engage in the strike; and many were assaulted and seriously injured. After protection was afforded by the police, sheriff's deputies, state constabulary and, in some cases, state or national troops, the numbers resuming work increased appreciably from day to day until in many places operations are about normal. Taken as a whole, the situation at present is good and steadily improving.

It will be observed that the strike is not the result of any claim by any workmen for higher wages or better treatment nor for any reason except the desire and effort on the part of union labor leaders to unionize the iron and steel industry. As stated in the first resolution, the action taken was "for the purpose of uniting all these organizations into one mighty drive to organize the steel plants of America."

Without discussing for the present the merit or demerit of labor unions it may be observed that union labor leaders openly state that they seek to unionize or, as they say "organize" the whole industry of this country. Those who do not contract or deal with unions, although they do not combat them, insist upon absolute freedom to both employer and employe in regard to employment and the management of the shops. The nonunion employers and employes both stand for the open shop. The unions argue for the closed shop or, as the leaders now insist, "the right of collective bargaining through labor union leaders." Every proposition contended for by

No Room for Anarchy

*CONSIDERABLE has been said in public of late concerning the attempt to spread the doctrine of bolshevism in this country. All of us have known for some time that this disease is persistent and that there has been some inoculation even in this best of countries. Still we deny that there is danger of serious trouble. There is only one way to treat this disease and that is to stamp it out, to meet it boldly wherever it can be found, to expose it and give it no chance for development. In this free country * * * * there is no room except in the prisons for the anarchist, the bolshevist or other individual who seeks to substitute the rule of force for the rule of law and reason.*—E. H. GARY.

Opening address delivered by President Gary before American Iron and Steel Institute, New York, Oct. 24.

the labor unions at the national industrial conference at Washington led to domination of the shops and of the men by the union labor leaders. Every position taken by the other side centered on the open shop. This is the great question confronting the American people and, in fact the world public. From 80 to 90 per cent or more of the labor in this country is nonunion. It is for them and the employers generally and the large class of men and women who are not, strictly speaking, employers or wage earners, to determine whether or not it is best for the whole community to have industry totally organized.

Fundamental Issue is Open Shop

I think the fundamental question submitted to the conference for recommendation to industries was the open shop. That question apparently could not be decided by majority vote for the reason that the conference was organized into three groups called labor, employers and public. No affirmative action under the constitution or adopted rules could be taken except by the unanimous vote of the three groups each of which voted by a majority of all its members.

The union labor advocates stand for collective bargaining through the unions. The others favor collective bargaining through representatives selected by the employes themselves from their own numbers.

The public group offered the following resolution:

"The right of wage earners in trade and labor unions to bargain collectively, to be represented by representatives of their own choosing in negotiations and adjustments with employers in respect to wages, hours of labor and relations and conditions of employment, is recognized.

"This must not be understood as limiting the right of any wage earner to refrain from joining any organization or to deal directly with his employer if he so chooses."

The public group voted in favor of this resolution. The employers group and the union labor group voted against it.

The union labor group finally offered the following resolution:

"The right of wage earners to organize without discrimination, to bargain collectively, to be represented by representatives of their own choosing in negotiations and adjustments with employers in respect to wages, hours of labor, and relations and conditions of employment is recognized."

It was stated by Mr. Fish of the employers group that "we cannot read this resolution without reference to the history of the last two weeks, and the events of yesterday. * * * * As the argument in this conference has developed, it has been perfectly clear that the sum and substance of the resolutions with reference to collective bargaining that have been presented heretofore, excepting the substitute from the employers' group, the Chadbourne resolution and the substitute offered for it by the employers' group, that these resolutions in substance meant this and nothing else, that this conference is asked to take action which will force, if possible the hundreds of thousands of employers in industries throughout this country to recognize the labor unions whether they will or will not, and to force their organizations to deal with the labor unions against their will. * * * * I shall personally feel obliged to oppose this resolution unless there is a plain definition as to what is meant by bargaining collectively."

The union labor group and the public group voted in favor of the resolution. The employers' group voted against it. Thereupon the union labor group retired from the conference.

All through the conference whenever the question of collective bargaining was discussed, it was apparent that the union labor leaders would not support any resolution in favor of collective bargaining except on the basis that collective bargaining meant bargaining through labor unions. For instance, on Tuesday when the two first resolutions above quoted were under discussion and ready for vote, Mr. Chadbourne for the public group spoke as follows:

"Mr. Chairman, I want to make a statement and to ask a question or two of Mr. Gompers with the chairman's permission." (Turning to Mr. Gompers.) "Mr. Gompers, the public group will retire and reconsider its vote, with the recommendation of its chairman, Mr. Baruch, if you and your group will do either one of two things: either add, 'or other organizations' after 'labor and trade unions' in the resolution, or give it as your group's interpretation upon this record equally as solemn as the vote that is taken upon the resolution, that it is the interpretation of the gentlemen in your group that it does not mean any other organization or any other association."

To this the union labor group would make no response.

As further evidence of the attitude of the union labor leaders it may be mentioned that in the 12 points published by the leaders who were conducting the strike they included and insisted upon the following:

"Abolition of company unions."

The unions claim that collective bargaining through different forms of shop organization, made up of the employes tends to limit the extension of unions by increasing their members. The nonunion employes and their employers insist that collective bargaining through labor unions means that employes are forced to join the unions as otherwise they could not be represented. So it is perfectly clear that the whole argument returns to the main proposition of open or closed shop.

And yet it would be unfortunate if we could not discover opportunities for further improvement; if we failed to read or to listen to the criticism of others; if we let pass the requests or suggestions of our workmen for changes which they believe would be proper concerning their employment; if we neglected to give our employes, individually or in groups, opportunities to discuss with the managers all questions of mutual interest; if we minimize in any degree the well recognized fact that the public good is of prime importance and that private interests must be subordinated.

Must Stamp Out Bolshevism

Considerable has been said in public of late concerning the attempt to spread the doctrine of bolshevism in this country. All of us have known for some time that this disease is persistent and that there has been some inoculation even in this best of countries. Still we deny that there is danger of serious trouble. There is only one way to treat this disease and that is to stamp it out, to meet it boldly wherever it can be found, to expose it and give it no chance for development. In this free country, with its reasonable laws wisely administered, its golden harvests, healthful climate, peace-loving inhabitants who are generous in contributions for relief and protection, schools, churches and hospitals, there is no room except in the prisons for the anarchist, the bolshevist or other individual who seeks to substitute the rule of force for the rule of law and reason. If there are slinking, desperate, murderous bolsheviki in this country, even in small numbers, I believe the secret service department of the government should detect and expose them and that the iron hand of justice should punish them as they deserve, and as I have faith in this country and in its institutions, I believe this will be done and done promptly. Any one who doubts the ability of the proper authorities to protect the persons and property of our people against bolshevism and other similar doctrines, fails to appreciate the courage of our citizens and the terrible force and strength of subdued calmness when they are surrounded by threatened danger.

Institute Indorses the Open Shop

Iron and Steel Manufacturers Give Judge Gary Great Ovation for His Stand Against Domination of Radical Unionism—King Albert is Honor Guest at Banquet—Meeting Makes Notable History

Steel Industry Solidly Backs Judge Gary's Stand

WHEREAS: Elbert H. Gary, president of the American Iron & Steel institute, has rendered to the American people and the American iron and steel industries a service of inestimable value by his course as a representative of the public in the industrial conference at Washington; therefore,

Be it resolved, That the American Iron and Steel institute, assembled in its semiannual meeting, hereby records its unqualified approval of Mr. Gary's firm stand against any infringement of the rights of the individual in labor or in business, rights fundamental to American industrial supremacy as well as to American liberty. That it admires the vision and courage enabling him to discern and effectively oppose the radicalism injected into trade unionism by unscrupulous leaders, an element especially dangerous under present conditions, when world-wide unrest has created an opportunity for agitation aimed at the perpetuity of institutions under which our country has achieved its strength and our industries attained their efficiency and prosperity.

MARKED by extraordinary events and conditions of a highly impressive and momentous character, the sixteenth general meeting of the American Iron and Steel institute at the Hotel Commodore, New York City, Friday, Oct. 24, contributed notably to the history of that organization.

Outstanding in its national significance in connection with the present exorbitant demands of the radical elements of union labor and the wide sweep of strikes in this country, was the full indorsement of the principle of the open shop as advocated by Judge Gary in the steel strike and before the industrial conference at Washington. Resolutions formally approving Judge Gary's stand were adopted with enthusiasm. Judge Gary himself was given probably the greatest ovation of his career both at the opening session and at the banquet in the evening.

The banquet in all respects, was without parallel in the long list of similar functions of the past. King Albert of Belgium attended as the guest of honor and gave a message of good will and of appreciation of the American iron and steel industry to the assembled manufacturers. The presence of Eugene Schneider, head of the Creusot works of France and president of the Iron and Steel institute and other European guests, gave the affair a decidedly international aspect. The attendance at the meeting was unusually large.

King Albert Given Warm Greeting at Banquet

SCENES unparalleled at any other similar function in former years made the banquet at the Commodore hotel Friday evening probably the most notable in the history of the American Iron and Steel institute. The dinner was graced by the presence of King Albert of Belgium and suite, by the king's son and heir, Prince Leopold, and by various other international figures of prominence, among which was Eugene Schneider, president of the Iron and Steel institute of Europe, and president of the Le Creusot steel works of France.

King Albert was given a highly cordial and truly American reception. His entrance brought the guests to their feet in a burst of prolonged cheering. Then with the banquet hall darkened, the spot lights were directed upon the Belgian and American flags and the national airs of the two countries were played in turn, by a concealed orchestra, while the 1300 present stood at respectful attention. There followed three cheers for King Albert and then a similar demonstration for Prince Leopold.

A toast was called and drunk to King Albert who responded by proposing a toast to the "President of the United States and a prompt recovery of his precious health."

"I thank very heartily Judge Gary for his very kind words. I thank you all for the especially warm manner in which you received his toast," the king continued.

"With his permission, I should like to call Judge Gary an old friend of Belgium. It is indeed for me a great pleasure and real privilege to address this assembly of the great men of one of the great industries of the world. Circumstances did not permit me to visit more than two of your big steel plants, but I know they are all unrivaled in the world for up-to-dateness and efficiency. There is much for my countrymen to be learned from you, especially under present conditions."

The international character of the occasion was further signified by the address of Monsieur Schneider, the French steel leader and president of the European Iron and Steel institute who is now in this country as the head of the French mission for the

international conference on trade matters. Monsieur Schneider stated that in view of his identification with the European institute and his having been made an honorary member of the American institute, the banquet might be considered as a symbol of international unity for peace and harmony in the future. He spoke of the generations of his family which have been connected with the development of the Creusot works and told of the part his father had taken in the establishment of the armor plate industry in the United States. He paid due recognition to the co-operation and aid supplied by the American iron and steel industry to France during the war and declared that out of this has come a close friendship which should be highly beneficial to both countries in future relations.

France's Dark Struggle Told

"I do not know whether in America you fully realize what the war meant to our steel industry, what a terrible blow the war struck it, and to what an almost superhuman test the industry was put," said Monsieur Schneider.

"Just remember that at the declaration of war most of our directors, engineers, foremen and workmen were mobilized. Sixty-seven per cent were called to arms. In August, 1914, the majority of our plants, even those situated farthest from the zone of war operations were obliged to close down. The unhappy outcome of the early battles served only to aggravate the situation. The largest steel plants in the east of France and our most productive coal fields either fell into the hands of the enemy or were in the theater of military operations. As early as October, 1914, France was deprived of the 20,000,000 tons of coal that the mines of the North and the Pas de Calais supplied.

"With one blow the steel industry lost 85 blast furnaces out of 156, 48 open-hearth furnaces out of 164 and 53 converters out of 100. Our means of production were reduced 81 per cent for pig iron and 63 per cent for steel, as compared with 1913. And it had to be just at this time, at the Battle of the Marne, that our government called upon us for a daily supply of 100,000 shells for 75 millimeter guns. We were not producing even 20,000.

"Gentlemen, I should not like anyone to pass through the hours through which we lived, the patriotic anguish that was strangling us, the fever that consumed us for long months. We got to work. We convinced public opinion that the army would have to return part of our staff. We appealed to the devotion of our women. For every woman employed in our metal industries before the war, we employed 390 in 1918. We raised to a maximum the output of the plants that we still retained. We built new ones. We toiled for four years day and night.

"In July, 1915, we had only 20 stacks at work. In January, 1916, we had 40 and January, 1918, 57. Before the armistice, in September, 1918, we had 59 in operation, 30 were down, and 13 in course of construction—a total of 102. Little by little we had made up for the enormous losses caused by the German invasion.

"In July, 1915, we had at our disposal 100 open-hearth furnaces, six down and 35 in course of construction. In September, 1918, we had 165 open-hearth furnaces in operation, 16 down and 44 in course of construction.

"In January, 1916, we had 1305 crucible furnaces. In September, 1918, we had 2459. In January, 1916, we had 21 electric furnaces; in September, 1918, we had 40.

"The result of this effort was that for every 100 rifles manufactured in 1914, there were 29,000 in 1918. For every 100 machine guns in 1914, we manufactured 7000 in 1918. At the beginning of the war we turned out each day 13,000 shells for the 75s and 200 for the 155s. In 1918, our production was 200,000 for the 75s and 45,000 for the 155s per day. In 1915, we manufactured only 2600 75-millimeter guns. Two years later, we manufactured 11,000. Our heavy artillery at the beginning of the war can hardly be said to have existed. Everyone knows that the surprise of the first battle of the war came chiefly from Germany's overwhelming superiority in heavy artillery. At the time of the armistice, we had 6500 heavy guns—3400 short 155s, 1100 long 155s together with other sizes up to 21 inches. France was thus enabled not only to meet her own needs, but was in a position to equip the entire Serbian army, to send considerable quantities of heavy artillery, rifles and machine guns to Russia, Roumania and Greece as well as to supply the American army with all the field artillery it needed and half the heavy artillery.

What Alsace-Lorraine Means

"As you know, the restitution of Alsace-Lorraine is of very great importance to the French steel industry. The resources of the iron ore beds are estimated at 1,832,000,000,000 tons, and the annual production of the Lorraine district which was formerly under German domination equaled 21,156,000 tons. This will double the ore production in France and will make her by far the largest ore producer in Europe.

"Alsace-Lorraine possesses 66 blast furnaces, producing 3,870,000 tons of iron, and 26 converters and 10 open-hearth steel furnaces that produce 2,286,000 tons. This additional production of pig iron and steel not only covers the present needs of France but leaves a surplus for export. Including the production of Alsace-Lorraine, France now stands second as an iron and steel producing country, excelled only by the United States.

The situation may be summarized as follows:

Iron Ore—
22,000,000 tons before the war.
43,000,000 tons after the war.

Pig Iron Over—
5,000,000 tons before the war.
10,000,000 tons after the war.

Steel—
5,000,000 tons before the war.
8,000,000 tons after the war.

Gaston Liebert, French consul general, took the occasion to thank Judge Gary for his stand towards bolshevism and spoke of the encouraging progress which France had made in combating radical tendencies of this character. He alluded to the proverbial thrift of the French people and the soundness of their investments. He emphasized therefore that should France ask for long credits from the United States it would be because they are needed and he assured American business men that they need have no hesitancy in granting these as a safe investment.

Taking up Monsieur Liebert's allusion to bolshevism, Judge Gary said: "Is bolshevism to be feared? It is in the sense that the bandit, the robber, the burglar or any other criminal who may plan to do wrong is to be feared. But in this country, where the citizens are loyal, patriotic and stubborn for the right, there is no danger from bolshevism, in the sense that it can threaten this nation's existence or civilization's."

Lewis Nixon, public service commissioner of New York, predicted that the rapid transit system of New York would be bankrupt by Jan. 1 unless quick assistance to it was forthcoming in the way of higher fares. He described the tremendous growth of the transportation requirements of the metropolis and foretold the future extensions of its rapid transit system, which would command the interest and attention of the engineering and steel industries. Mr. Nixon expressed the belief that the present opposition to granting increases to transportation companies would pass in time but perhaps not sufficiently soon to avert many bankruptcies.

Admiral S. S. Fletcher, who during the war was closely in touch with the iron and steel industry in supplying the nation's needs, paid a tribute to the manufacturers for their wholehearted response, and stated that the co-operation of the government and industry in that crisis had taught many things which would be of untold value to the country should any such future emergencies arise.

Gary Gets an Ovation

Judge Gary was accorded a great demonstration by the assembled iron and steel men as he entered the convention hall for the opening session Friday morning. The moment Judge Gary ap-

peared in the hall every man in the room sprang to his feet with cheers and applause. The ovation continued as Judge Gary proceeded down the long aisle to the speakers' platform and for several minutes thereafter. Judge Gary was visibly affected by the demonstration. "I recognize you have been whole heartedly applauding a principle that pertains to the very life of progressive industry. But I want you also to know that I fully appreciate and will always remember your personal kindness to me."

At this juncture, Willis L. King of the Jones & Laughlin Steel Co., took the chair and recognized Joseph G. Butler Jr., who presented a resolution expressing the recognition of the American iron and steel industry of Judge Gary's service in the industrial conference at Washington and of its full and unqualified approval of the position he had taken against the radical doctrines and demands of present-day trade unionism. "The American Iron and Steel institute owes a debt to Judge Gary, it owes a debt to itself, it owes a debt to the entire iron and steel industry of the United States. I may even go further, it owes a debt to the country, and perhaps still further, it owes a debt to the entire world. I am going to give you an opportunity to discharge this duty." Mr. Butler then presented his resolution which was seconded by E. A. S. Clarke, and was adopted without dissent amid great cheering.

Judge Gary, responding, said:

Gentlemen, I thank you. I would be less than fair and less than sincere if in this connection I failed to emphasize the thought that while circumstances have happened to place me in a position which has centered your thoughts and your words of approval upon me, yet there is not much strength in anyone who happens to be prominently connected with or the leader of a movement unless he has the necessary support. And therefore I want to share the very generous confidence which you have expressed in words with large numbers of others.

I would like to say that from the outset the positions which have been taken by your president, as expressed in words, has been without exception approved by the finance committee of the United States Steel Corp., by its board of directors, by its stockholders as stated in many letters and telegrams which have been received by the board of directors of this splendid institution, of which we are all proud, by the iron and steel industry generally of the United States and Canada, by thousands upon thousands of individuals, chambers of commerce, associations and organizations, including farmers' institutions, scattered all over this country, from north to south and east to west; and I am glad to say by the intelligent, influential, splendid press of this country.

And so you and I, all of us, cheerfully, emphatically extend the sentiments of the resolution which has been passed to all these groups of individuals to whom I have referred.

Judge Gary then proceeded to deliver his opening address in which he carefully explained and analyzed the deliberations of the industrial conference at Washington of which he was a member, condemned the arbitrary attitude of the union minority of labor, and called for the suppression of Bolshevism in whatever form it shall appear in this country, with the iron hand of the law. His address frequently was interrupted with cheers and at its close there was another stirring demonstration.

Mine Bureau's Work Described

Van H. Manning, director of the bureau of mines, in his address describing the work of the bureau indicated important research investigations which have been carried out as it was proposed to make in connection with the iron and steel industry:

"Coming now to the bureau's work in connection with the iron and steel industry, I must say at once that, in proportion to the industry's importance, relatively little has been done," said Mr. Manning. "Iron ore and pig iron represent one-quarter of the value of the total yearly production of mineral wealth in the United States, but of the published researches of the bureau less than a tenth deal directly with problems in the iron and steel industry, and only about one-fifth with subjects that are at all closely related and would aid in the solution of those problems. The work of the bureau on safety and health conditions around blast furnaces and steel plants is doubtless well known to you. Broadly speaking, the organic act establishing the bureau defines its work as (1) looking after the safety and health of the miner, and (2) the prevention of mineral waste. Thus, when the time came to consider the problems connected with the iron and steel industry, it was the safety side of the subject that first received attention. In 1915 a bill passed by congress authorized the establishment of ten mining experiment stations of the bureau in addition to those which had already been established. The first three were established in 1916, all of them in nonferrous mining districts. Of the second three which were established, one was located in the northwest, and to it was assigned the problem of the beneficiation of low-grade iron ores. As is well known to all of you here, it has been estimated that the iron ore reserves of the country will last about 30 years at the present rate of consumption. However, this estimate is based upon the utilization of those ores which at the present time can be treated profitably in blast furnaces. Likewise, as you also know, there is a tremendous tonnage of ores throughout the United States, and especially on the Mesabi range which are too low grade to permit of their being treated in a blast furnaces without having undergone some form of beneficiation.

"In addition to the field of work I have just outlined, the bureau is, of course, also interested in all those problems which are confronting the iron and steel industry in connection with present day metallurgical practice. For example: As is well known, the so-called bessemer ores have been largely depleted and the problem has arisen as to how it may be possible to convert nonbessemer ores into bessemer ores. Considerable progress has recently been made along this line by certain commercial concerns.

"Another problem is that of overcoming the ill effects of sulphur when high sulphur coals are used in steelmaking. The supply of low-sulphur coals is running low and the steel industry at the present time finds it necessary to use high-sulphur coals. Therefore, the problem presents itself of removing this sulphur from the coal or else adding to the steel after it is produced, some element which will neutralize the effects of the sulphur and at the same time in no way decrease the essential properties of the steel.

"There is also the problem of the alloy steels; that is, of the production of steels having peculiar properties by reason of the addition of rare elements. The bureau in connection with this work on rare metals has made an extensive study of the mining, treatment and utilization of these rare metals."

W. E. Ruder, chief metallurgist of the General Electric Co., Schenectady, described the "X-Ray Examination of Metals" and this paper was discussed by H. S. Rawdin of the bureau of standards, Washington. R. L. Sanford, physicist of the bureau of standards, presented the subject "Magnetic Analysis of Steel." Dr. Henry M. Howe presented a discussion covering both X-ray and magnetic examinations. At the afternoon session Wilford Sykes of Westinghouse Electric & Mfg. Co., presented the paper on "The Electrification of Reversing Steel Mills," which was discussed by D. B. Rushmore of the General Electric Co.; Dr. Henry M. Howe, "The Open Hearth Furnace and Processes;" G. K. Burgess, chief of the division of metallurgy of the bureau of standards, "Temperature Measurement in Steel Furnaces"; and Lawford H. Fry of the Standard Steel Works Co., Burnham, Pa., "The Manufacture of Ingots for Locomotive Tires and Rolled Wheels." G. Aertsen, assistant to the vice president of the Midvale Steel & Ordnance Co. at Nicetown, Pa., discussed Mr. Fry's paper.

The directors of the institute at their meeting during the luncheon hour elected to honorary membership Sir William Beardmore of William Beardmore & Co., Ltd., Glasgow, the retiring president of the iron and steel institute, and Monsieur Schneider, the present president of that body and head of the Creusot steel works in France, who was present at the meeting.

Little American Steel Is Needed

Requirements of European Reconstruction Made Known at International Conference at Atlantic City—Long-Term Credits and Increase of American Imports Essential to Restored Trade Equilibrium—International Organization Formed

EUROPE is not going to require as much of American materials for its reconstruction as most people in the United States have been led to believe. This fact was brought clearly before the manufacturers and business men who last week attended the international trade conference held at Atlantic City under the auspices of the chamber of commerce of the United States. Even before such requirements as actually may be purchased in this country are finally provided, means of financing this business and extending credits over possibly a long period of years must be found. How best to supply the necessary funds was fully discussed publicly and privately during the conference, but upon adjournment it was still an undetermined matter. Steps were taken at the conference for the recreation of an international trade organization for continued mutual assistance.

Representatives of France, Belgium, Italy and Great Britain met Americans during the conference, first discussing individual national and international needs in private in committees, then in addresses in the open sessions of the conference, and in private interviews. The foreign delegates made a very favorable impression upon the Americans in attendance and frankly stated the conditions of their respective countries. Great Britain, it was found, will not need much American assistance except as this country can relieve her of some of the burdens of caring for the other European nations while Great Britain is engaged in settling her own problems.

France, Italy and Belgium need American aid and need it badly, but, as was emphasized by not only the visiting speakers but by the American participants in the general program, this assistance is not the kind required by weak, characterless nations, but by nations of strength and ability suffering from the ravages and privations caused by the war with Germany. Help will be given these countries, it was declared, just how is not known, but help will be extended. This was made clear time and again in the addresses given by the business men of the United States.

Industrial Needs of Europe Outlined

STEEL, it was discovered, will not be needed in such vast quantities as was generally supposed. France in 1920 will be in the market for only 100,000 tons of ship plates. Italy, for a period of five years, needs but 580,000 tons of iron and steel annually. Of this 200,000 tons is foundry pig iron, 100,000 tons of scrap, 60,000 tons of plates and shapes, 215,000 tons of ingots and semifinished steel and rails, and 5000 tons of tin plate. Belgium's requirements of semifinished steel are limited to unstated estimates which, it was said, will be diminished as the restoration of the Belgian works and mills progresses. England will need nothing, it was stated.

The reason for this limited aggregate tonnage, in comparison with the large requirements generally believed to be needed, is due to the progress France, Belgium and Italy have made in rehabilitating themselves following the signing of the armistice. While the world has been sympathizing with these countries and wondering how they may be helped, they have been hard at work and have accomplished much, the conference was told. What has been done, of course, is only a small proportion of what must be done to restore the devastated regions to anything near normal, but the fact that the factories, mills and workshops of these nations are steadily being rebuilt or converted to peace needs accounts in a measure for the limited tonnages which are to be purchased.

Eugene Schneider, head of the famous Creusot Steel Works, of France, chief spokesman for the visitors as a group and for France individually, explained how that nation has risen from fourth place in the world's production of steel to a position second only to that maintained by the United States. Her expected maximum output of 8,000,000 tons of steel resulting from war expansion and from recovery of her former provinces, will enable France to export at least 2,000,000 tons, Mr. Schneider declared. This statement was made in explanation of why the demands upon the United States will not be as large as was expected.

Financing is Chief Problem

Finance is the crux of the entire international trade problem, it was shown, and the very thing around which depends the reduction of the enormous trade balance piling up in favor of the United States. Because of the lack of a settlement of this problem, and because of high ocean freight rates, the prices prevailing in this country, and other contributory causes, purchases will be made by the European countries where their money will go farthest. In order to bring conditions to normal, it was stated, the American exports must be reduced gradually and the imports increased. Only by payment of obligations to this country in the production of goods which the United States can use and by the extension of long-term credits may the trade balance be equalized.

Coal requirements of the European allies are heavy, Italy, of course, being most in need of fuel. Fuel oil, it developed, is to be used to a much greater degree and the increased use of available water power will be tried to solve this phase of the problem. France and Italy particularly are doing much in this line and expect to do more. Progress will stop, according to Mr. Schneider, at the point where electrification, as a result of the harnessing of this natural resource, would be a national liability in the case of any future armed invasion. For this reason, it is expected fuel and waterpower will be used to an equal degree with a considerable greater maximum either way in the case of national necessity.

Foodstuffs, of course, are required, as are chemicals, textiles, shipping, oil, coal, etc. Machinery in large quantities for practically all uses, machine tools, lumber and other recon-

struction materials are wanted and badly. While the restored factories of Europe are expected to furnish much of the materials needed, in order to get the shops and plants back on a completed and operating basis there are some things which must be purchased here. The personal contact of the foreign missions with the delegates to the conference from American business houses already has resulted in some transactions and the arrangement for others, depending upon the finance and credit situation and its developments.

Mr. Schneider was easily the outstanding figure of the allied representatives. It was he who, as the head of the French mission, made the response to the address of welcome by Homer L. Ferguson, president of the chamber of commerce of the United States. It was Mr. Schneider who made the address for all the allied groups in stating Europe's combined needs. It was he who stated France's individual requirements. The esteem in which he was held by his European colleagues was reflected in the reception his statements obtained from his hearers and in the impression of his personality upon them.

Secretary of Commerce Redfield delivered an address that was pronounced by many to be the best of the many he has made in his capacity as a cabinet officer. Norman H. Davis, president of the Trust Co. of Cuba, New York, as the representative of Secretary of the Treasury Glass, delivered what was pronounced an extremely level-headed view of the financial situation. Dwight W. Morrow of J. P. Morgan & Co., literally swept his audience off its feet when he made an earnest plea for the extension of loans to the European allies. The foreign representatives who discussed the financial and economic topics of the conference made profound impressions.

All in all the conference was generally recognized as the first concrete step toward a clear presentation of Europe's real requirements and gave the business men who attended perhaps the best view of conditions short of those obtained by them either first hand abroad or in personal contact with customers in this country. Out of the conference is expected to be reorganized the former international chamber of commerce or some kindred body. The need of constant intercourse commercially between the United States and foreign countries was recognized, and with steps under way to effect such a permanent organization and with the creation of a finance committee to continue the study of that problem, the conference adjourned, the foreign representatives to immediately begin a tour of the industrial centers of the United States.

Eugene Schneider, head of the mission and president of the Creusot Steel Works, in an address set forth the situation in the mining and steel industries of France. He said:

Rich in iron ore, but somewhat lacking in coal, France had, before the war, managed to build up an iron and steel industry, not only sufficient for her needs, but leaving a surplus for export.

The mining and steel industries have been severely hit during the war, but no sooner had the armistice been signed than work began again in the devastated regions, where our plants are rapidly coming back to life. Even though the restitution of Alsace-Lorraine does not improve our coal resources, it nearly doubles the production of iron ore, pig and steel, thus enabling France to build up a considerable export trade in this line, and to assume in the world's markets the place that is her due.

In 1913, the production of the French coal mines amounted to 40,000,000 tons. The total consumption was 63,000,000 tons, leaving a deficit of 23,000,000 tons, which came from Belgium, Great Britain and Germany. As regards coke, the prewar situation was also unfavorable, the imports amounting to 3,000,000 tons, about on a par with the French production. Even before the war, France was striving to develop her coal and coke industry; new coking plants had been erected and six new coal mines were to have been opened in the new Pas de Calais basin.

During the war, the production of the coal mines fell 50 per cent, the majority of the pits in the north and Pas de Calais being occupied by the enemy. They were actually the scene of the severest battles. Who does not remember the capture of the Vimy ridge and the battles of Lens?

As I have just said, the production of coal in France fell from 40,000,000 tons to less than 20,000,000, but the strenuous efforts of the mining companies and their men raised the production to 21,000,000 tons in 1916, and 28,000,000 in 1917. At the same time, France harnessed waterpower in order to save coal. France is one of the richest countries in that line. Before the war we had 700,000 horsepower available. Today the figure is 1,200,000 horsepower. Next year it will be 1,500,000 horsepower. Up to now $300,000,000 have been spent in developing waterpower; and during the war alone $120,000,000 were subscribed.

After the war, even with the utmost developments of waterpower we shall be short of coal. When the pits are again in order, the production of France will amount to 45,000,000 or 46,000,000 tons. Alsace-Lorraine produces about 3,000,000 tons, but as she consumes 11,000,000 tons, her return to France, instead of making the problem easier has made it more difficult. The home needs of the country will amount to about 88,000,000 tons. The Saar basin produces 13,000,-

What Allied Countries Want From America

A CONSOLIDATED suvey of the reconstruction needs from the United States, of Belgium, Italy, England and France was presented by the committee on reconstruction supplies. Its analyses of the situation in respective countries based upon reports of the different missions is as follows:

BELGIUM

The Belgians need from us, and principally, first of all, money, then tools, coal, coke, oil, mining machinery, railroad engines, lumber.

They state that because of the unfavorable rate of exchange and because of our higher prices, expensive freights and slower deliveries they probably will be obliged to purchase in Germany goods which they would much prefer to purchase from us.

ITALY

Italy's reconstruction problem is principally agricultural, due to the fact that about 90 per cent of her people are engaged in agriculture. They need agricultural machinery in considerable quantities, also machinery for ditch-digging and grainage work. They also need assistance in the rebuilding of the fisheries industry.

They need coal, oil and a wide variety of lines, in the providing of which the United States should be able to play a most important part. They also need extensive assistance in connection with harbor improvements.

ENGLAND

England, as stated by their reconstruction supplies committee, has no reconstruction problem which they are not fully qualified to take care of themselves.

The problem of housing British laborers was discussed considerably, but without leaving the impression that we were to have any part in its solution.

FRANCE

In general, the French situation as regards industry and commerce is far and away in advance of what is rather generally believed in this country to be the case.

The French committee stressed the importance of proceeding along reconstruction lines which will recognize sound economic principles.

They need, as do Belgium and Italy, money, lumber, machinery, automatic car couplers and railroad signal systems and other improvements in their transportation situation, and a number of lines which under other conditions we might be able to provide, but which as conditions are in most cases would be difficult and in many cases impossible, to purchase from us principally because of exchange difficulties and costly transportation.

000tons, which, deducting its own consumption, leaves a net surplus of 4,000,000 tons. Under the stipulation of the treaty of peace, Germany is obliged to send 20,000,000 tons every year to France to replace the production of the mines she destroyed; moreover, she must deliver to us an extra 7,000,000 tons, which was the average amount she sold to us yearly before the war.

Germany Fails to Deliver

Up to the present we have not even received one-half of the quantities promised to us from Germany, and England has very greatly reduced her coal exports. So we find ourselves faced by an actual shortage of about 20,000,000 tons.

The use of fuel oil must be extended. Before the war, the use in France of the products derived from crude petroleum was limited to gasoline and lubricating oils. Fuel oil we must use in large quantities in future. Large beds of shale exist in the vicinity of Autun. They may be exploited for the production of oil. Beside, Alsace-Lorraine brings back with her the Peschelbrom district with 50,000 tons of oil per year.

However, the old resources of France are insufficient for her needs, and we shall have to import. We are making the necessary preparations. In our ports, tanks have been built with a total storage capacity of 600,000 tons. We have 4000 railroad tank cars; we have under construction 10 tank steamers which will be added to the very small oil fleet we already possess and to the ships we hope to get from Germany.

As regards the production of iron ore, France occupied before the war the second place in the world, and her position in the steel industry was fourth.

The opening and development of the Lorraine district was due to the discovery of the Thomas process and the increase of production has been extremely rapid in the last few years. From 5,000,000 tons in 1910, it jumped to 21,000,000 tons in 1913. Besides, Algeria produces over 1,000,00 tons and Tunis half a million tons. This production left a surplus of 10,000,000 tons available for export.

As regards pig iron and steel, the development of the French industry had been rapid, the increase between 1900 and 1913 being 87 per cent for pig iron and 150 per cent for steel. The domestic consumption had increased in a similar manner, but there was a surplus left for export.

Early in the war, France was deprived of the whole Lorraine district. Eighty-three per cent of her total production of iron ore passed into occupied territory and 9 per cent into the battle zone. Production fell to 2½ per cent at the time of the first battle of the Marne, but rose afterwards to 7½ per cent in 1916 and to about 10 per cent in 1917.

The situation in the steel industry was similar; 81 per cent of the blast furnaces and 65 per cent of the steel works were in the invaded zone or actually under fire. However, the French industry got to work and, during the war, blast furnaces of an aggregate capacity of 620,000 tons, and converters or open-hearth furnaces of a capacity of over 1,500,000 tons were erected.

France, after the war, will take second place in the list of the world's steel countries, following immediately behind the United States. Her engineering industry will follow the lead of the steel industry and will get ready for export business. Plans have already been laid and steps are already being taken for capturing the markets which were formerly in the hands of her enemies. France does not want to compete with her allies in the foreign markets, but she wants to supersede Germany in the countries where German industry had the lead before the war.

A summary of the needs in this line by Belgium, France, Great Britain and Italy was presented by the committee on metals, of which E. A. S. Clarke, president of the Consolidated Steel Corp., was chairman. The report follows:

In general the reports showed a greater stability of labor conditions and less menace from social unrest than previous public information had indicated. These discussions also showed that the prospect for the complete re-establishment of industry in those countries is decidedly hopeful, provided supplies of raw materials and goods can be secured. So far as metals are concerned it was disclosed that the requirements for France for the ensuing year are estimated at 100,000 tons of ship plates and 90,000 to 100,000 tons of copper.

The estimates of their requirements submitted by the Italian committee included the following annual quantities over the next five years:

	Tons
Foundry pig iron	200,000
Plates and shapes	60,000
Ingots and semifinished steel and rails	215,000
Scrap iron	100,000
Tin plates	5,000
Copper	15,000
Various other metals	10,000
Total	605,000

There are under consideration in France and Italy plans for extensive electrification of railways, which if put into operation will require considerable additional supplies of copper over those stated.

The Belgian requirements are limited to semifinished steel and copper sheets, but the determination of approximate quantities needed is so dependent upon the rate of restoration of the Belgian works and the supply of necessary fuel as to prevent for the present the making of definite estimates.

The meeting with the British delegation developed the fact that no specific requirements have been formulated, and that Great Britain expects to be able to obtain all the supplies of raw materials necessary for her normal trade, without any special arrangements therefor. The British chairman stated that "the object of America and Great Britain ought to be how best to utilize their outputs for the benefit of the devastated areas. Great Britain has already sent considerable consignments to the continent in the way of metal goods for reconstruction purposes. We expect not only to be able to continue this, but also to increase the quantities."

Consideration of the situation presented by the French, Italian and Belgian committees disclosed the fact that the American industries either have, or are capable of producing surpluses adequate to meet these requirements, provided satisfactory and effective means of financing the transactions involved are arranged. While to a certain degree and in some lines the American industry would be able to take care of a part of these requirements in normal commercial transactions, the aggregate of these requirements involving long credits is so large that, in the opinion of the committee on metals, some special financial machinery must be arranged in order to enable the satisfactory fulfillment of these requirements. In view of the fact that filling these requirements presents a problem beyond the scope of the normal financial machinery, it is the judgment of the committee on metals that some emergency legislation such as is contemplated by the Edge-Ackerman bill now before the congress in Washington, should be enacted. The utilization of such emergency facilities for financing exports would enable the American metals industries to meet Belgian, French and Italian requirements with the greatest possible dispatch and so contribute to the most prompt restoration of normal conditions in Europe.

Belgium's Rehabilitation Sketched

M. Florimond Hanker of the Belgian mission described the reindustrial habilitation which has been brought about up to the present time in that country.

"The damage to steel and iron mills was on such an enormous scale that complete restoration will take a long time," said Monsieur Hanker. "But despite all difficulties, work is being resumed in nearly all remaining factories, plants are being rebuilt and our stolen machinery is being brought back from Germany, Belgian industrial leaders are determined to put their plants back into operation no matter what the cost. Steel production now is 27 per cent of normal and iron production 51 per cent. It would require several hours for me to tell you in detail of the destruction of factories at Liege, Hainaut, Ougree-Marihaye and other places.

"In the matter of coal mines, we suffered less than the French because the Germans preserved our coal deposits for themselves in anticipation of the time that never came when they believed they would have Belgium's seacoast and ports and be able to conquer England.

"Belgian railroads damaged or destroyed during the German occupation are being rapidly repaired and re-established and on many lines schedules are normal. When the armistice was signed 1500 kilometers of railroad had been destroyed. So rapid has been the work of restoration that there remain less than 55 kilometers of unimportant lines unrestored."

Discuss Remedies for Labor Ills

Engineers at Mid-West Meeting of American Society of Mechanical Engineers Believe Study of Workmen and Conditions May Lead to Industrial Peace—Problems of Research and Labor Unrest Discussed

INDUSTRIAL unrest, its causes, effects and suggested remedies, was the subject of much consideration at the joint meeting of the midwest sections of the American Society of Mechanical Engineers at the Claypool hotel, Indianapolis, Oct. 24 and 25. More than 200 members of the Birmingham, Chicago, Cincinnati, Cleveland, Detroit, Milwaukee, St. Louis and Indianapolis sections were in attendance.

The first session was opened Friday afternoon, Charles Russ Richards, dean of the school of engineering and director of the engineering experiment station, University of Illinois, presiding as chairman. In introducing the program, Dean Richards set forth the difficulties confronting American manufacturers today and emphasized the importance of the question to engineers. He said that in the past such problems had not greatly concerned engineers but that in the present day they cannot be ignored.

Maj. W. C. Rogers, vice president and manager of the Employers' association, St. Louis, who presented a paper entitled, "Industrial Unrest," stated that labor can be compared to the human body and, as the body is subject to certain ills and disturbances, likewise is labor. The discussion was opened with an analysis of causes of unrest resulting in the the strikes and lockouts which are lowering the production of the country. These causes may be summed up briefly as the high cost of living, the ostentatious use of wealth, the apparent success of radicalism in its aims elsewhere, class hatred, the influence of of unamericanized immigrants and pernicious Bolshevist propaganda.

Criticizes Present Day Unionism

Although admitting himself to be in favor of the proper type of organization, the speaker stated that he was not in favor of the present trade unionism which caused the recent steel strike and threatens a walkout of coal miners. Speaking of the faults of unions as at present constituted, he said, "I believe in organization and do not hesitate to say that trade unions have contributed in a large way to the welfare of the workers. My criticism of the unions, however, is that they are too faulty in their present organizations. They are antisocial in their attitude toward courts specifically, and in that they set themselves up to the public as a class. They limit production. They place the standard of wages on the low basis of inefficient workmen. They demand the closed shop, which is indefensible from the American standpoint. They habitually violate their agreements and their leaders are frequently untrustworthy, especially where radicals threaten to take control. It would seem that the radicals are threatening the control of all."

Criticizes Unions

MY CRITICISM of the unions is that they are too faulty in their present organizations. They are antisocial in their attitude toward courts specifically, and in that they set themselves up to opposition to the public as a class. They limit production. They place the standard of wages on the low basis of inefficient workmen. They demand the closed shop, which is indefensible from the American standpoint. They habitually violate their agreements and their leaders are frequently untrustworthy, especially where radicals threaten to take control. It would seem that the radicals are threatening the control of all.—MAJ. W. C. ROGERS.

As a remedy for the situation, Major Rogers suggested six essentials to be obtained; the payment of adequate wages to all workers; adoption of the best measures possible for the health and safety of the workers, for proper housing and recreational conditions; the Americanization of foreigners; mediation and arbitration in all industrial disputes; democratization of industry by the establishment of shop committees, internally organized but not in any way connected with unions.

A paper prepared by C. F. Scribner, consulting engineer, Chicago, and entitled "Successful Methods for Improving Human Relations in Industry," was presented by Arthur L. Rice, managing editor of *Power Plant Engineering*. The labor problem is not a theoretical problem but an engineering, academic and economic one, according to Mr. Scribner. The shop should be placed on a piece work basis but only after proper standards of methods, operations and wages have been adopted so as to give the workman a fair living wage and an incentive for maximum production. The rates must be established by the collection of sufficient information to insure their fairness and must not be changed until the conditions under which the rates were first established have undergone some change.

Bonuses Must be Paid on Time

Mr. Scribner also suggested that wages and bonuses should be given the employe in separate envelopes. This offers an incentive for greater production and the man is able to see at once the increase in his earnings by his exerting a little more effort to his output. This payment of a bonus must be made at the due time if it is to have its full influence, for if delayed, some of the workmen may get the idea that the employer is stalling for time in which to doctor his books and decrease the bonus. A promptly paid bonus develops good faith between employer and employe.

"The Results of the Americanization Program Carried Out by the Commonwealth Edison Co.," was the subject of a paper read by A. D. Bailey, assistant chief engineer, Commonwealth Edison Co., Chicago. A short time ago this company undertook to Americanize some of its employes by instituting a school in cooperation with the Chicago board of education and the association of commerce. Although the results have not been remarkable compared to the large number of foreigners employed, the effort has been justified and it is believed that the few who did attend and receive some benefit will have sufficient influence on others to cause a growth in the classes in the future.

In connection with the recent problem of human engineering, Dr. J. A. Watkins, Cincinnati, presented a paper entitled "Industrial Medicine" in which he set forth the results to be accomplished by giving more attention to the physical well being and living and working conditions of employes. He stated that production

can be increased through the efforts of a physician who is employed to study the physical side of labor conditions in the shop, to study sanitary conditions, and further to study living and sanitary conditions in the homes of the employes.

University Gives Important Course

"Training of Students in Industrial Management," a paper prepared by Prof. B. W. Benedict, manager of the shop laboratories of the University of Illinois, received considerable attention. Professor Benedict explained how college students can be taught to manufacture a marketable product while receiving training. The students make 8-horsepower gasoline engines complete in every detail and attempt to produce them on a quantity basis. Each department of the shop, including the machine shop, foundry and the pattern shop is equipped with small offices, tool rooms and production boards as is the commercial shop.

Each student receives training in the details of each operation from the instructor and other students so that as his turn comes, he is able to take up the work in a satisfactory manner. Every operation is timed by a stop watch and his efficiency is calculated as the ratio of the time required for the operation to the standard time set by the department.

The brief discussion after the Friday afternoon session brought out the point that much more attention must be paid to human engineering or, in other words, the workman must be studied more carefully and his work so arranged that he can accomplish the maximum of work without physical strain. J. R. Bibbins, engineer with Blon J. Arnold, Chicago, said he believed a solution of the labor question could be solved by giving more attention and action to housing, transportation and human engineering.

Prof. F. C. Wagner, Rose Polytechnic institute, Terre Haute, Ind., in a brief discussion said that labor has the feeling that it is being exploited by capital and this feeling is due to the fact that labor cannot compute costs. He said further that labor must be educated to figure approximately the costs of finished products in order that they may know that they are receiving justice from the employer. Professor Wagner added that he chooses to define capital as someone else's labor.

Research was the subject of the technical session held on Saturday morning with Prof. A. M. Greene Jr., Rensselaer Polytechnic institute, Troy, N. Y., as chairman. Professor Greene is chairman of the research committee of the society and president of the Society for the Promotion of Engineering Education. The first paper given by Lt. Col. C. F. Hirshfield, director of the research department of the Detroit Edison Co., Detroit, was entitled "General Consideration of Present Status of Research in the Industrial Life of the Country."

R. E. Carpenter, head of the laboratory of the Aluminum Castings Co., Cleveland, in his paper, "Industrial Research, Its Function and Administration," took exception to a paper presented before a Canadian engineering society recently, which maintained that research men should not be taken from that work and placed in other lines of work, otherwise industry would decay. Mr. Carpenter believes that the placing of research men in other lines is advantageous to industry and further recommends that it is desirable to secure as many young men as possible for that kind of work as they frequently possess more enthusiasm than the older men.

Recommends a Central Laboratory

A paper by Louis G. Robinson, Louis G. Robinson Laboratory, Cincinnati, described how a single central laboratory can be made to serve several industrial concerns.

"Present Status of Fatigue of Metals Phenomena" was the title of a paper presented by Prof. H. F. Moore, University of Illinois, who has been devoting much time to the study of this subject. Professor Moore showed a moving picture of microphotographic film of specimens of metal placed in a fatigue or bending machine. This method makes it possible to see the contraction and expansion of the metal as the machine is operated. The development of small cracks and fractures which take place may be traced. Tests have showed that the metal fails from a so-called center of failure. Steel structures have many incomputable stresses and cracks may start from minute scratches on the surface. While cold rolled steel is statically stronger than hot rolled, it has been found that the former stands up no better under the fatigue test. As chairman of the committee on stresses of the national research council, Professor Moore has been given $15,000 to conduct further research along this line.

A new tractor testing plant, constructed at Purdue university, was described briefly in a paper prepared by Dean C. H. Benjamin and Prof. G. C. King and presented by Dean Benjamin. The apparatus, which operates on the treadmill principle, consists of three main parts; the treadmill, a draw bar dynamometer, and a brake or electrical control. The treadmill has been designed so that it is possible to shift the load on the front or rear axles so that conditions similar to service conditions are obtained. Two classes of tests are made with this outfit, one the consumers' test, made in connection with the agricultural experiment station for performance of the tractor, and the other the manufacturers' test which is made in a study of the mechanical construction of the machine.

A paper prepared by George S. Hessenbruch, consulting engineer, St. Louis, and presented by L. C. Nordmeyer, Tait & Nordmeyer Engineering Co., St. Louis, shows how waste material is utilized in St. Louis.

Because of lack of time, Dean J. R. Allen, director of research for the American Society Heating and Ventilating Engineers, gave a brief abstract of his paper which had to do with the experimental work being conducted in heating and ventilating in several laboratories in the country.

At a meeting of the council of the society on Friday morning before the meetings were opened, an appropriation of $20,000 was authorized for the extension and improvement of the society's publication, *Mechanical Engineering.*

Social features of the meeting included a fraternizing luncheon on Friday, a theater party for the ladies during the afternoon, a banquet in the evening and a luncheon at the Indianapolis Athletic and Canoe club on Saturday followed by an automobile trip to the Indianapolis motor speedway to inspect the motor repair depot and to witness airplane demonstrations.

Gives True American Talk

At the banquet W. H. Insley, Insley Mfg. Co., Indianapolis, served as toastmaster. Charles F. Coffin, president of the chamber of commerce, welcomed the society to Indianapolis. The response to the welcome was given by Dean M. E. Cooley, dean of engineering of the University of Michigan and president of the society. The speaker of the evening was Dr. Willis A. Moore, Cleveland, chairman of the national industrial speakers' bureau, who spoke on "Doing the Impossible." Dr. Moore made a plea for more good will in industry and increased production to lower present day costs. Special inspection trips were made Friday and Saturday to a number of industrial plants including those of E. C. Atkins & Co., the Nordyke & Marmon Co., Rockwood Mfg. Co. and the Diamond Chain Co.

Prepare Report on Steel Strike

Senate Committee Will Not Recommend Federal Action Except to Exclude Alien Agitators and Educate Foreign-Born Workers—Pittsburgh Sheriff and Army Intelligence Officer Testify

WASHINGTON, Oct. 28.—A report on the investigation of the steel strike by the senate committee on education and labor will be submitted soon to the senate, the investigation having been concluded last Saturday with the testimony of William S. Haddock, sheriff of Pittsburgh.

Actual results of the investigation in a legislative way are reflected in the Americanization bill which the committee has reported out, and the introduction of measures to deport or punish alien agitators and to make it a crime to advocate sedition. So far as the purpose of the Kenyon resolution calling for the investigation is concerned nothing can be accomplished by the committee. The resolution was designed to determine if federal action in regard to the strike is necssary.

The plans of Americanization and of handling agitators and radicals, whose activities in the strike have developed startling facts, however, promise to bear fruit. The investigation also has given the senate committee a better view of both sides of the case. While it is conceivable the employers may be criticized for certain things, such as the alleged failure to Americanize the workmen, and perhaps for long hours of work in some departments, it is not believed there will be much censure. In view of the testimony of Sheriff Haddock, it seems less likely that there will be harsh criticism of the Pennsylvania state constabularly and other authorities. While some members of the committee recognize thoroughly that many employes prefer to work long hours for extra pay certain ones appear to think the flat 8-hour shift should be put into effect in all departments. It is altogether likely that if the committee took this position, it would be only by way of recommendation and not an attempt to legislate on the subject. It is manifest that the 8-hour day could not be urged in the steel industry without also being made applicable to all industries engaged in interstate commerce.

Would Eliminate Illiteracy

With regard to criticism of strikers, it is believed the committee will vigorously assail some of the leaders and agitators and their radical views, and give strong support of legislation proposed to deal with them. It is thought by some that general deportation might be suggested for aliens, and punishment of native-born agitators. There also is likelihood, it is said, of the recommendation of more comprehensive legislation on immigration to prevent further influx of undesirables to the United States. At the same time, some senators think there already are sufficient laws to handle the entire situation but that they are not being enforced. Evidence given before the committee last Friday appears to support this view.

The committee has reported an Americanization bill designed to eliminate foreign tongues and illiteracy in the United States. This measure, reported by Chairman Kenyon of the committee, has been offered at this time as the result of the investigation of the strike which brought to the attention of the committee the fact that a large number of steel workers are unable to speak English. Senator Kenyon hopes to have the measure enacted at the present session of congress, but it is not certain that this can be done.

Only 5000 Striking in Allegheny County

WASHINGTON, Oct. 28.—Not more than 5000 men are "actually on strike in Allegheny county" and good order is being maintained, the senate committee on education and labor was told last Saturday by Sheriff William S. Haddock, of Pittsburgh, in the course of his testimony concerning the steel strike. Vigorous defense was made by him of his policy of preserving order and denial was made of reports that he had enforced unnecessary restrictions for the suppression of freedom of speech and public assemblage. He presented a formal statement to the committee, which was prepared with the assistance of George J. Campbell, of Pittsburgh, who accompanied him to Washington. Explanation was made by the sheriff of his policy with respect to the prohibition of public assemblages and he declared that restrictions placed on free speech were necessary to preserve peace and welfare of the community.

Bringing copies of official proclamations and correspondence on the subject of the strike and other documents bearing on the death of Fannie Snellings at Brackenridge, Pa., the sheriff told the committee that propaganda is being promoted by strike leaders to discredit the authorities charged with keeping the peace. He exploded the theory of the labor agitators that the death of the woman was due to the steel strike. He defended strongly the state constabulary and his deputies, saying they had adhered and are adhering strictly to the law, and he said charges against both the state constabulary and the deputies were unfounded and should be discredited in every respect.

After outlining the procedure of organization of his forces preparatory to the strike, the sheriff told of the publishing and posting on the night of Sept. 20, two days before the strike began, of a proclamation commanding all local peace officers throughout the county to be on their guard and perform their official duties. Notice was given in populous districts to disperse groups of three or more persons. Care was taken to state that the rights and liberties of the people were not to be interfered with.

"In addition to this I verbally announced that the sheriff would not overrule the local authorities as to public meetings, except that no public meetings were to be permitted or conducted in any foreign tongue," he said. "My reason for this order is that my observation has been in this and other troubles that practically 90 per cent of the offenders against law in matters of this kind are either aliens or naturalized citizens of foreign extraction, who are easily led into attacks upon our government."

Sheriff Haddock said there are in

Allegheny county over 40 members of the Pennsylvania constabulary cooperating with him.

"One of the greatest causes of unrest such as now exists by reason of this steel strike," he said, "is the circulation of wild, anarchistic and unfounded rumors and stories concerning the conduct of the state constabulary, and the deputy sheriff and what happens to those lawless persons who offend and are arrested."

Up to the present, he said, good order has been maintained with but one or two small and unimportant outbreaks, due possibly to relaxation of vigilance on the part of local officers because normal conditions semed to be restored. He attributed this peaceful situation entirely to the earnest co-operation of all peace officers from the policemen to the mayors.

"Yet there is a condition of unrest and uncertainty because of the efforts to enlist men actually at work in the cause of the strikers," he stated. "The agitators are very active and stage every incident they can, such as lawsuits, meeting when permitted, etc., to attract the workingman's attention, but in all the plants of Allegheny county it is doubtful if more than 5000 men are actually on strike. Most all of these are foreign and unskilled labor."

Anarchists at Gary Members of A. F. of L.

WASHINGTON, Oct. 28.—Progermanism, I. W. W.ism, anarchism, socialism, bolshevism, and other nostrums that are hateful to Americanism have been found to thrive in Gary, Ind., Chicago and surrounding territory in connection with the steel strike. Many of those affiliated with the exponents of unamericanism belong to the American Federation of Labor, although not consciously encouraged by the latter organization. Testimony to this effect was given last Friday before the senate committee on education and labor by Lieutenant Donald C. Van Buren, an intelligence officer of the staff of Maj. Gen. Leonard Wood, in command of troops in Gary. Numerous pamphlets, circulars and propaganda tracts, together with statements of men arrested at the beginning of military occupation, were read and submitted to the committee by the witness.

Tons of I. W. W. literature have been found in Gary, he said. Eighteen members of a new local radical body there, Hungarian I. W. W.'s, were rounded up in one night, all of them common laborers who are on strike, and every one of whom belonged to the American Federation of Labor. Some were warned and released and others were recommended for deportation, but immigration officials in Chicago, it was stated, either have refused, because of "lack of conclusive evidence," to have warrants sworn out for them or have taken no action whatsoever. In the case of Ivanhoff and DeGeorge, anarchist leaders, a report was made to the department of justice, which so far has begun no prosecution, the committee was told. Both men, Russians or Austrians, have left Gary. DeGeorge was said to be a chemist who, it was learned, was operating near the Aetna explosive works, near Gary, where guncotton was available from wastes outside of the mills.

"The bible of the 'red,' the anarchist and bolshevist," said Lieutenant Van Buren, "is the manifesto of the communist party of Russia, put out at what is known as the third international meeting at Moscow in March. Many thousand copies of this were in Gary."

Printed by German Publishing House

Lieutenant Van Buren read extracts from this booklet and from other radical literature urging workers to revolt and overthrow the "capitalists" and the government.

"All of the radicals of the country are centering on the propaganda of Lenine and Trotsky," he said. "I call to your attention that fact that the literature was printed in Chicago by the Arbiter Zeitung Publishing Co., which is significant."

Speaking of the Hungarian I. W. W. union, the intelligence officer said many of the members burned their membership cards when troops went to Gary. For the most part, he said, they were ignorant and it is his view that they have been exploited by dangerous leaders. The I. W. W., he said, is sending propaganda to Gary either by courier or by express disguised as merchandise in order to escape the postal laws. The bulk of the literature was said to be printed in either Hungarian or Russian.

The lieutenant told of the socalled Saxon club in Gary, "a German outfit." In this club a sergeant found on the wall a huge, fine German flag, with two small American flags below and at either side of it to make them look ridiculous, the witness said.

"Did the sergeant haul down the German flag?" asked Senator Sterling.

"You may be assured that he did, sir," replied Lieutenant Van Buren. "The German who was in charge protested that the sergeant should also take down the American flags, but the sergeant told him if he opened his mouth again he would run him through with the bayonet. The German kept still."

This club, said the lieutenant, was a branch of the Germanamerican Citizens' league, spelled as here indicated, without hyphen or capital "A" for American. This league, it was said, is headed by a Dr. Gerhardt in Chicago, who was authority for the statement that it has a membership of between 7000 and 8000 in Chicago.

"Its purpose," said the lieutenant, "is to perpetuate German 'kultur' in the United States." It was stated that since the armistice the league has raised its head and is flourishing throughout the Middle West at present. All of its officers, it was stated, were mixed up with the German-American alliance, which congress forced to disband. The German league was said to be conducting a tremendous propaganda. Much of the socialist literature, according to Lieutenant Van Buren, is printed in German and is being distributed and is advocating antimilitarism. The German league, it was declared, will do anything to promote anti-Americanism and is taking advantage of the steel strike to do this.

The intelligence offices said the name of Oscar E. Anderson, who was present at the hearing, headed the list of a Hungarian socialist organization in Gary, and that an I. W. W. official was heard to say that Anderson was the most active I. W. W. worker in Gary. Anderson, born in Chicago, subsequently took the stand and denied his connection with any radical organization, saying he belonged only to the Amalgamated Association of Iron, Steel and Tin Workers, and was on strike. Formerly he belonged to the socialist party, he said, but withdrew from it about one year ago. Anderson served in the United States navy for four years, and his statement to the committee appeared to be entirely straightforward and to disprove suspicions against him. Anderson said that there are not

more than 250 or 300 reds among the 75,000 people in Gary. He asserted that "they don't count."

The intelligence offices said that not one leader of the radicals was American-born, while virtually all of the radicals were declared to be aliens, although some have taken out their first naturalization papers.

The Russian bolshevists, said Lieutenant Van Buren, were more clever than the Hungarians and had started a movement in Gary to organize a Russian red guard army "to overthrow the government," endeavoring to gather recruits from exservice men.

"If 10 per cent of these radicals were wiped out and deported, would it have a wholesome effect?" asked Senator Smith.

"Absolutely, sir," replied Lieutenant Van Buren. "Most of them are so ignorant they are easy prey for exploitation. We would then have the job of making Americans out of those remaining."

"C. E. Ruthenburg, of the communist party of America, out under bond of $20,000, still is spreading red propaganda," he said. "If men like him, Martens, 'bolshevist ambassador,' and Bill Heywood were handled the whole thing would be settled."

Announce New Freight Rates to Germany

Washington, Oct. 28.—New freight rates from North Atlantic ports to Hamburg, Bremen and Danzig, effective Oct. 20, have been announced by the shipping board. The rates on general iron and steel articles are $1.25 per 100 pounds to Hamburg and Bremen, and $1.50 per 100 pounds to Danzig. These include boiler tubes, bolts and nuts, car wheels, wire nails, iron pipe fittings, pipe, 4 inches or less, outside measurement; screws, staples and barbed wire. Other iron and steel and related articles and rates follow, the smaller sums representing those to Hamburg and Bremen, and the larger those to Danzig: Wire netting, 70 cents and 80 cents a cubic foot; hand agricultural implements and agricultural machinery, including tractors, by weight or measurement; aluminum ingots, $1.50 and $1.80 per 100 pounds; ball bearings, $1.50 and $1.80; benzol, special; coke in bags, special; copper bars and sheets, copper ingots, copper wire, rods and coil, $1.50 and $1.80; ferrosilicon, $3.75 and $4.50; lead billets, special; machinery, up to two tons, weight or measurement; monel metal, $1.40 and $1.70 per cubic foot; nickel, $2 and $3; pig lead, special; scrap brass and copper, and silica in bags, $1.50 and $1.80; spelter, special; tin and tin plate, special; vanadium, $1.50 or 1½ per cent ad valorem and $1.80 or 1½ per cent ad valorem; zinc sheets and slabs, special.

Find Constitution Forbids Free Port Zones

Washington, Oct. 28.—Representative Fordney, of Michigan, chairman of the house committee on ways and means, declares constitutional objections stand in the way of legislation to establish free ports for foreign trade in the United States. As a result a number of bills which were introduced to establish zones have been discarded, although hearings already had been held and were proceeding.

The only chance for any such legislation, according to Fordney, is to make all ports free, instead of only a few, as intended. He said the committee had its attention directed to Section 9 of the constitution which provides that "no preference shall be given by any regulation of commerce or revenue to the ports of one state over those of another; nor shall vessels bound to or from one state be obliged to enter, clear or pay duties in another."

Form New Steel and Wire Company in New York

Under the laws of New York state, the Eastern Steel & Wire Co., Inc., has been incorporated with a capital stock of $1,250,000. Fiscal offices have been established at 45 West Thirty-fourth street, New York, and general offices are located at 120 Broadway.

Plans practically have been completed for the erection of a wire mill at Newark, N. J., for the manufacture of special grades of wire, including high carbon spring, nail, annealed, bright, tinned, and coppered market, tinned broom and mattress, and fine weaving wires. Capacity will be approximately 75 tons per day. Plans and specifications covering wire-drawing machinery, motors, nail machinery and other required equipment will be completed within the next 30 days. In the meantime, the company has taken over the plant of the Atlantic Nail & Wire Co., Inc., Newark, N. J., a successfully operating company.

Officers and directors of the Eastern Steel & Wire Co., Inc., are as follows: President, Maxim Karminski, formerly president of the Carbolite Chemical Co., subsidiary of the Tennessee Copper Co., and now president of the Steel Producers' Export Corp., New York; vice president, Thompson W. Decker, treasurer of the Sheffield Farms Co., Inc.; secretary and treasurer, H. Leslie Skinner, formerly director of Shibakawa & Co., Inc.; general manager, E. A. Henry, formerly manager of the steel department of the Vulcan Steel Products Co., New York, and vice president and general manager of the Seneca Wire Mfg. Co., Fostoria, O. Frederick A. Wallis, general agent of the Fidelity Mutual Life Insurance Co., and Arno Geiser, director and secretary of the Max Oscher Co., investment bankers, also are interested.

Limit Orders

In Sulphate of Ammonia Because of Supply—Government Sells Phenol

New York, Oct. 27.—Despite considerable foreign demand for sulphate of ammonia, especially from the Orient, sellers have been forced to restrict new business to relatively narrow limits. This has been due to the great scarcity of supplies, which has developed particularly in recent weeks as a result of the steel strike. At present, sellers are devoting much of their attention to a careful allocation of supplies among contract customers. Prices on sulphate have been tending upward. On export business, $4 to $4.25 eastern seaboard, is quoted. On domestic business, future orders are being figured at around $3.40 to $3.50 producers' plants, and spot at $3.50 to $3.75.

All other coal by-products are unchanged. The demand for benzol at present is not of the volume of a few weeks ago, but the continued curtailment of output has developed a marked shortage of supplies.

The government stocks of phenol, estimated at 30,000,000 pounds a couple of months ago, continue to be marketed at 12 cents, f.o.b. eastern stores. Outside stocks of similar grades are being offered near this figure. Naphthalin is being sold in good quantities.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.50 to 3.75

Contract

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds Producers' Plants

Sulphate of ammonia	3.40 to 3.50

Wilson Studies New Labor Plans

Failure of National Industrial Conference Leads to Suggestion by Public Group That Whitley System be Adopted—Another Conference May be Organized—Gompers Calls All Union Chiefs to Discuss "Battle" Measures

WASHINGTON, Oct. 28.—Obstinacy of the labor group disrupted the industrial conference last Wednesday. Despite the appeal of President Wilson, written from his sick bed, this group refused to show the slightest signs of compromise. Efforts of President Samuel Gompers, of the American Federation of Labor, a delegate of the labor group, to establish a case in behalf of labor failed.

When Gompers' final resolution concerning collective bargaining was voted down by the employers' group he gave notice in a dramatic speech that the labor group could go no further and would withdraw from the conference. This it did, refusing even to wait and hear proposals from John Spargo, of the public group, in a last effort to maintain the conference intact.

Secretary of the Interior Lane, chairman of the conference, after communicating with President Wilson, asked on behalf of the President that the public group remain in session in an effort to formulate a program to bring capital and labor together. The group remained until Friday night and then disbanded after failing to accomplish anything. In a report to the President, signed by its chairman, Bernard M. Baruch, the group suggested that a commission be appointed to evolve a system of conciliation and arbitration boards, similar to the Whitley system in England.

"In the recognition of the right of organized workers to be represented by delegates of their own choosing," the group stated, "difficulties will from time to time arise. We believe that it would be possible for properly constituted arbitral authority to adjust such differences with justice and fairness to all parties concerned."

The report recommended that a bureau in the department of labor be created to study all forms of arbitration in their practical application and to make report on them.

"We do not believe this group can at this time with advantage further proceed with the discussion of the great questions with which we have been dealing," concluded the report.

Wilson May Take Further Action

It is understood the administration will be urged to take immediate action in the direction of creating an agency which will at least offer federal arbitration to employers and employes. Secretary of Labor Wilson presented a plan to the industrial conference which is said to be under consideration and which met with favor among delegates of the conference. It provides for boards of employers and employes in each industry, with a general board of appeals.

Secretary Lane said that he believed the President would organize a new conference, which would endeavor to bring about a basis for industrial peace. Reports are heard that a new commission on industrial relations may be selected. The old one is held to have done more harm than good, although some claim it was due largely to its personnel, which included some radical organized labor advocates, and was not due to the principles it aimed to develop.

Meanwhile plans of organized labor are proceeding to stage the greatest industrial battle in the history of the country. This is forecast by announcement of Gompers that a conference of the heads of 112 international unions affiliated with the American Federation of Labor would be held in Washington in the "near future" to discuss present and impending disputes. The steel strike undoubtedly will share prominently in the "discussions."

Railroad brotherhoods, farmers' organizations and Canadian laboring organizations will be asked to participate in the conference.

Gompers Sings Swan Song as Closed Shop Fails

WASHINGTON, Oct. 28.—The national industrial conference really broke up because it would not yield to the wish of the labor group that it arbitrate the steel strike. It voted down a resolution to this effect, after E. H. Gary, chairman of the United States Steel Corp., had reiterated with emphasis, as a delegate of the public group, that he would not vote to arbitrate the strike. Then the labor group turned to another device which was meant to bring about arbitration of the strike, as well as to establish principles which it has been upholding since labor became organized in this country. This related to collective bargaining. But it would not support the collective bargaining resolution of either the public or the employers' group. The upshot of the matter was the introduction on last Wednesday afternoon of a collective bargaining resolution by Mr. Gompers reading as follows:

"The right of wage earners to organize without discrimination, to bargain collectively, to be represented by representatives of their own choosing in negotiations and adjustments with employers in respect to wages, hours of labor, and relations and conditions of employment is recognized."

Resolution Was Ambiguous

The public group voted for this resolution. The day previous it had voted against an almost identical resolution. This left only the employers' group voting against the resolution. This defeated it, inasmuch as the unanimous vote of all three groups was necessary to carry a resolution. Delegates of the public group vigorously assailed the attitude of the employers' group and said there could be no harm in adopting the Gompers resolution. But the employers' group maintained that the resolution, in addition to being ambiguous, was in effect the same as the one brought in the day before and voted down both by it and the public group, and which in substance said the right of employes to organize in trade and labor unions is recognized. The employers saw in it an attempt to unionize industry generally regardless of the wishes of the great mass of employes.

Obviously, adoption of this resolution would have given the greatest

moral support to the steel workers committee to bargain with the employers.

It is understood that only one member of the public group voted against the resolution, all of the others who were present voting for it. Judge Gary was not present, having been called to New York. In the employers' group, four members voted for the resolution, insufficient to make a majority, 10 having voted against it.

Tried to Becloud the Issue

Frederick P. Fish, of the employers' group, said that the matter of collective bargaining was interjected into the affairs of the conference to take the place of the resolution on the arbitration of the steel strike for a purpose, and that purpose had clouded the conference throughout.

A. A. Landon, public group, of the American Radiator Co., created a stir when in supporting the resolution, he attacked both the United States Steel Corp., and the steel strike leaders as being public nuisances which should be suppressed. Mr. Gompers then arose and sang his swan song, as he called it.

"The declaration which we have proposed," said Mr. Gompers, "is rejected by the employing group. They want shop organizations, the employers' union. If they can get away with it, why, that is their job. But they are building on quicksand." He said that some day representatives of employers will meet again with representatives of labor, and when they do "the employers will be glad to talk collective bargaining."

Chairman H. A. Wheeler, of the employers' group, making the last speech before adjournment, said the record of that group was before the conference and he proposed to stand by it. The employers' group, he asserted, could not yield on its policy as to collective bargaining without being cowards and cravens. He said the employers' group was ready to continue with the conference and that it refused to take the responsibility for its dissolution.

Employers Explain Results

The following statement was issued by the employers' group after the conference was declared adjourned:

"The adjournment of the national industrial conference, as originally constituted, brings up the question whether the weeks of the controversy over one phase only of industrial relations leaves the situation without a single gain. The employers' group, soberly reviewing the work of the conference, discovers three definite gains:

"1—It has been demonstrated that failure is inevitable where preliminary organization of the elements composing such a conference is absent and where no preparation is made for the orderly presentation of a program which shall include all of the known factors on which industrial relations are based.

"2—Collective bargaining, an accepted and desirable policy in industry, has been brought more prominently before the country and will influence a sincere effort on the part of innumerable manfacturers to find an acceptable medium through which this collective relationship may be secured and maintained in the industrial establishment.

"3—Collective bargaining as a policy or principle, cannot be safely used in the broad and general sense with which the public has been acustomed to express it, but must be defined clearly as to its applicability to the varying conditions of industry and the varying relations that exist between wage earner and the employer.

"Fundamental to the whole question of collective bargaining is the responsibility of those who bargain, and this is directed quite as much at the employer as at the wage earner or the organization of which the wage earner is a member. Only where there is a definite duel responsibility lived up to as scrupulously as is required in other contractual relations can collective bargaining, in any form or under any interpretation, be successful.

"Then it must be remembered that the industrial life of the country in its employment relations divides definitely along certain lines. No one will deny the right of the individual wage earner and his employer to negotiate terms of employment for industrial relations acceptable to both, but aside from this there is the dealing between the employer and his employes by means of the shop industrial council, dealing through a trade or a labor union, and all of these methods are acknowledged and practiced by employers.

"It may be charged that the employers' group in defeating the Gompers' resolution, denied the right of organization and of collective bargaining.

"The purpose of the resolution through cunning phrases coined to carry double meaning was to commit the conference to support the only brand of collective bargaining ever offered by the group presenting it, and the employers were bound to resist to the end.

"The employers' group could not deny the right that it so freely and fully conceded in its own sub-resolution which the conference defeated and it stands today, with the adjournment of the conference, on the record of its substitute and its interpretation, confident that the sober judgment of the American people will come to understand that the position taken was in the defense of the open shop, an American institution that shall not be undermined and destroyed by any organized combination seeking to threaten its life.

"Our social and industrial fabric is not in danger. Employer and wage earner will live and work together, but the conference has demonstrated that the right of the employer to deny representation unworthily sought shall not be abridged; nor shall the right of the wage earner collectively to place before his own employer his needs and his aspirations and his interest in the establishment be abridged.

"We are leaving on the record of the conference this declaration of true American principles and on this declaration the employers' group and the employers of the nation will stand in fair dealing with the wage earner through the critical days of readjustment just ahead."

Union May be Stopped From Soliciting Employes

An employer and an employe may make an agreement that the employe refrain from joining a trades union during the time of his employment, and agents of trades unions may be enjoined from soliciting the employe to join a union, according to a decision of the Supreme Court of the United States. The decision which is of particular interest at this time was handed down Dec. 10, 1917, and may be found on page 229 of volume 245 of the court's decisions. Attention of employers is called to the decision in a letter written by H. W. Flagg, commissioner for the Employing Printers of America. The letter follows:

"The following decision handed down by the Supreme Court, in the case of Hitchman Coal & Coke Co. vs. Mitchell, is of interest to the printing fraternity as well as all other manufacturing businesses:

"It was held that the employer who conducts his business on the nonunion basis may have an understanding or agreement with his employes that they are nonunion and will so continue while in his employment, and that officers and agents of labor unions, having knowledge of such arrangement, may be enjoined from soliciting such employes for membership in the union and from interfering with such arrangement. In other words, an employer has the right to employ only those who are nonunion and who agree to continue nonunion while in his employment, and the employer is entitled in a proper case to have union interference with this arrangement enjoined.

"To secure the benefit of this decision, the employer should have his employes sign cards indicating their clear understanding that the shop is operated nonunion, etc. In the event that the union interferes with this nonunion arrangement, the employer should serve notice of the arrangement upon those union officials, agents and agitators who are interfering with the arrangement between him and his employes. If such interference continues, the employer may ask that it be enjoined under the authority of the above decision without waiting until his place is picketed and until his employes and applicants for employment are intimidated."

Directors of the Taylor-Wharton Iron & Steel Co. have declared the regular quarterly dividend of 1¾ per cent, payable Nov. 1 to stock of record Oct. 24.

Extending Plant

Of Dominion Steel Corp. on Large Scale—To Build Furnaces

Toronto, Ont., Oct. 25.—President Mark Workman, of the Dominion Steel Corp., has announced that plans are being completed for continuing a policy of expansion on a comprehensive scale. The plate mill, now almost completed, is a natural step toward the building of Canadian ships, and he predicted that the time is not far distant when the largest ocean-going vessels will be built in Nova Scotia.

The company has spent nearly $1,500,000 in Newfoundland to increase the output of its mines and quarries, in accordance with the increased requirements of the Sydney plant. New submarine coal mining operations will be immediately undertaken at Bonar Point, on the north side of Sydney harbor. The object is to obtain high-grade metallurgical coal required for the manufacture of the steel to be used in the plate mill. Plans prepared for the new workings involve the expenditure of approximately $2,000,000 and provide for the most modern equipment obtainable.

With the plate mill in operation, the present furnaces will be unable to supply the necessary steel for all purposes, and consequently several new large open-hearth furnaces are to be constructed immediately, having a capacity of about 70 tons each. The present cast house is being enlarged and extended to provide for future needs in this department, in which improved methods will be introduced for pouring the steel into the molds to prevent too quick cooling.

The Dominion Bridge Co., of Montreal, following its decision to manufacture papermaking machinery, has closed a large contract with the Laurentide Paper Co., for an entire set of papermaking machines. This branch of the company's operations will be carried on at its plant at Lachine.

British Columbia mining men believe that they have found a phenomenally large area of exposed iron ore, near the Whitewater river in that province. In the opinion of James A. Hawthornthwaite, of the British Columbia legislature, the discovery of the vast limonite resources in that district has assured British Columbia blast furnaces, rolling mills, and all other accessory enterprises essential to the operation of a great steel plant.

The P. Lyall & Sons Construction Co., Montreal, which some time before the signing of the armistice installed an experimental department to provide against the time when the making of munitions would no longer form a part of its manufacturing activity, is planning to manufacture automobiles.

Pig Iron From $26.25 to $32 in France

Lorraine pig iron containing more than 3.25 per cent of silicon was quoted in France Oct. 5 at approximately $32.50. Pig iron containing from 2.25 to 3.25 per cent of silicon was quoted from $30 to $31.25 and grades containing less than 2.25 per cent were quoted from $26.25 to $29.38. Dollar exchange fluctuated during the week from 7 francs, 80 centimes, to 8 francs, 50 centimes, making it difficult to present exact values, but the average on which the quotations are based was 8 francs.

Hematite was quoted at $48.75 to $51.25 in France, while in Belgium it was quoted at $56.25, the rate of exchange for the Belgian franc being practically the same. Other quotations in France and Belgium follow, the prices being for 100 kilos, or 220 pounds:

	France	Belgium
Shapes	$7.50	$8.50
Rails	8.10	7.81
Sheets, three millimeters	8.75	10.31
Sheets, five millimeters	8.50	.....
Sheets, two millimeters	9.75	.....
Blooms and billets	5.60	.....
Merchant steel	7.50	.....
Galvanized sheets	....	23.12 to 31.25
Steel castings	....	18.75 to 21.25

Obituaries

BERNHARD THEODORE BURCHARDI, vice president of the American Machine & Foundry Co., Brooklyn, N. Y., died Oct. 22, at his home in that city, aged 70. Mr. Burchardi came to this country from Germany nearly 50 years ago. He built the great ocean pier at Palm Beach, Fla., and later constructed the Florida East coast and the Florida West railroad and also the Gulf stream road. Mr. Burchardi became general manager of the American Machine & Foundry Co. in 1902 and designed the building occupied by that company. He likewise was president of the Wahlstrom Tool Co. and was interested in other corporations.

Horace Hudders, secretary, treasurer and purchasing agent of the Aldrich Pump Co., Allentown, Pa., died recently in that city.

Fred A. Larkin, mechanical engineer, and formerly representative of the Allis-Chalmers Mfg. Co., Milwaukee, died Oct. 19, at his home in Brooklyn.

Thomas A. Cain, forman of the die department of the Wiley & Russell division of the Greenfield Tap & Die Corp., Greenfield, Mass., died suddenly in the factory, Oct. 6, aged 63 years. Mr. Cain had worked at the plant 47 years.

James Laughlin Jr., director and member of the executive committee of the Jones & Laughlin Steel Co., Pittsburgh, died Oct. 5, at his home in Zellwood, Fla. He had retired from active participation in the management of the company several years ago and had made his home in Florida for several years.

John H. Tinkham, traffic manager of the Hendee Mfg. Co., Springfield, Mass., died of heart failure at his home in that city, Oct. 11, aged 49 years. Mr. Tinkham had been in the employ of the company for more than 14 years.

W. P. Sparks, who for the past year has been representative at Indianapolis for the Cleveland Milling Machine Co., Cleveland, died Oct. 10. Mr. Sparks was held in high esteem by his friends, members of his firm and by the trade generally.

Alfred Osgodd Blaisdell, designer of the propelling machinery for the monitors used in the Civil war and on the first span of the Brooklyn bridge to cross the East river, died Oct. 22, at his home in Brooklyn, N. Y., aged 87.

Thaddeus F. Woodman, who for the past 30 years has been a director of the Ohio Iron & Steel Co., Youngstown, O., died in that city on Oct. 24, at the age of 72. For 50 years, Mr. Woodman has been identified in business and industrial circles in the Mahoning valley.

Col. Francis J. Regan, president of the J. J. Regan Mfg. Co., Rockville, Conn., one of the foremost citizens and among the most prominent in industrial and financial life in Rockville, died at his home in that city, Oct. 10, aged 58 years. He was quartermaster general on the staff of Gov. Marcus H. Holcomb.

Strike Cripples British Furnaces

Majority in Every District of United Kingdom Blown Out as a Result of Walkout of Trainmen—Mills Also Affected, Although Wages of Iron and Steel Workers Are Increased—Dealing in Pig Iron Suspended for a Time

Bureau of THE IRON TRADE REVIEW,
Prince's Chambers, Corporation Street,
Birmingham, Eng., Oct. 3.

THE iron and steel trades have been reduced by the reckless and selfish acts of the railwaymen to a worse state than existed in any trade during the war. A sham notice was given 24 hours before the strike, making precautions impossible and the strike had scarcely commenced before blast furnaces in all districts of the kingdom began damping down or blowing out.

The effect of the strike will be felt long after its termination. In the South Staffordshire district only a few isolated furnaces are in operation at this date. In all instances where the furnaces are out, the opportunity will be taken to make repairs, and this will mean a fairly long period of idleness, and a short supply of pig iron, limiting operations of finishing iron and steel works. When it is remembered that before the strike the supply of pig iron was insufficient, it will be realized that any extension of the industry to cope with the great demand is out of the question for the present. In the ore mines of Yorkshire 9000 men were thrown out of employment Sept. 29, and an additional 12,000 men in the Cleveland district, 40,000 men at the Tees side steel works, 40,000 in South Wales, 10,000 in Sheffield, and at least 10,000 in the South Staffordshire district. North Staffordshire is particularly affected, as the works there are laid out almost wholly for railroad service. In every district the majority of the blast furnaces are blown out.

The furnaces in South Staffordshire are to some extent assisted in their coal supply by the canals; but this is useless as far as coke is concerned, because all the blast furnaces are dependent on the supply of coke from the North of England, which has to be brought by rail, while the same is true of ore. This accounted for the stoppage of Hickman's great blast furnaces and steel works at Bilston, South Staffordshire, which are fed with ore almost exclusively from the new ore field in Oxfordshire.

There is neither buying nor selling of pig iron at present. Finished iron and steel works are generally stopped, but the South Staffordshire district is a little more fortunate than some others owing to its alternative system of transport by means of canals. Birmingham has a network of canals, served by horsedrawn barges, often scoffed at as obsolete but now of some use. Scores of Birmingham works have been kept going, while the South Staffordshire iron and steel works, especially those which were able to accumulate small stocks of pig iron, kept their forges and mills in operation longer than many of their competitors elsewhere.

Another difficulty at present is due to the impossibility of storing large quantities of finished material, most iron works warehouses being little more than loading wharves. One of the few steel works still in practically full operation is the works of Lord Dudley, at Round Oak, as it is nearly self-contained.

While stopping production, the strike also has arrested the supply of imported semifinished material. A great deal of American steel has arrived at ports, where it must remain until railroad cars can be found to convey it to its destination. Before the strike some finishing mills were in great difficulties for raw steel, and these have been the first to cease operations for lack of material. At present no British steel works is willing to negotiate business for the supply of steel for rerolling purposes, so that the winter outlook is not promising.

The strike is particularly hard on the iron and steel workers whose wages boards have the most elaborate arrangements for discussion and negotiation, in fact, prohibiting stoppage of work. The arrangements have worked so well that for several decades no strike of any importance has occurred.

The bimonthly price ascertainment of selling prices under the Midland iron and steel wages board for July and August has been issued. It provides for an increase of 10 per cent in wages for all classes of iron workers, effective Oct. 5. This is an onerous burden to lay on an industry whose costs of production were increased by a wage advance of 27½ per cent two months ago. It is understood that the ironmasters will not consider any increase in selling prices to compensate them for additional cost, as they consider the trade already is crippled for competition by high prices. They prefer to bear the loss themselves, especially as under the sliding scale they would merely widen the circle of rising prices and wages which for the past two years has proved a handicap to the industry. It is likely that at many iron works a fairly long rest will be taken, whatever be the result of the strike in order that a good start may be made under new conditions.

The railroad strike has completely overshadowed the molders' strike, which still drags on, crippling the engineering works. A great deal of attractive and urgent business is being held up for want of castings. There is no prospect of a settlement, as the molders have not abandoned their claim for increased wages and their employers are more determined than ever to insist that they abide by the agreement under which the wages question was to be submitted this month to the arbitration court in connection with the Engineering and Employers' federation.

Another strike is threatened in South Wales. A number of the men engaged in the tinplate trade have not received the 12½ per cent war bonus and at a recent meeting of the joint industrial committee at Swansea the employers agreed to extend this to the whole of the trade. It is hoped that this may have the effect of averting the strike.

Birmingham tinplate warehouses have been besieged by customers anxious to obtain supplies. Merchants have been taking care of their stock and there has been no difficulty in meeting all demands. Buying is fairly active at the iron warehouses.

British Works Merge

An amalgamation has been effected between Messrs. Cammell Laird & Co., Ltd., and the Midland Railway Carriage & Wagon Co. Ltd., the latter a well known Birmingham wagon building company, according to a British correspondence to THE IRON TRADE REVIEW. It is planned to develop very largely the manufacture of steel railway wagons in connection with which the Midland company has established a large factory in Nottingham, in addition to its concern at Birmingham.

Refractories

Still Moving Slowly, Although Production is Being Kept Up

Pittsburgh, Oct. 28.—The movement of refractories is still extremely limited, as the iron and steel interests are specifying only against such requirements as they must have. Although the steel plant strike is nearly ended in most districts, the gain in working forces has been greatest among skilled workmen and common labor such as used in the unloading and piling of refractories still is scarce. The railroad administration maintains embargoes against the iron and steel works in its efforts to prevent car shortages, and the reason for this policy is said to be the shortage of common labor.

Though obliged to pile output quite freely, refractories manufacturers are not cutting down production, which still averages about 60 per cent of capacity. This course is dictated by the belief that present conditions cannot last indefinitely and the possibility of enforced curtailment of output in the event of a strike of the coal miners on Nov. 1 is another factor in the maintenance of production. Prices are unchanged, but are largely nominal in the lack of new business of any account.

Refractories

(Per 1000 f. o. b. works)

FIRE CLAY BRICK
(First Quality)

Pennsylvania	$36.00 to 41.00
Ohio	36.00 to 38.00
Kentucky	36.00 to 41.00
Illinois-Missouri	30.00 to 40.00

FIRE CLAY BRICK
(Second Quality)

Pennsylvania	$30.00 to 35.00
Ohio	20.00 to 25.00
Illinois-Missouri	25.00 to 30.00

(Per Net Ton)

55 per cent	$ 40.00 base
76 per cent	100.00 base

Leslie E. Freeman, according to announcement by the American Chamber of Commerce of Brazil, 37 Liberty street, New York, has arrived in this country to open trade relations between the United States and Brazil. Mr. Freeman is equipped with data concerning the markets of Brazil and will supply this information as requested to manufacturers. The chamber is affiliated with the Rio de Janeiro chamber and plans are being made for the publication of a Brazilian-American trade review which is to be printed in this country every month.

Trade Convention Plans Special Features

One of the important features of the Seventh National Foreign Trade convention, to be held at San Francisco, May 15-20, 1920, will be the world conference of American foreign traders, according to preliminary announcements just mailed to American firms represented at previous conventions, who are requested to have their representatives, living or traveling abroad, time their visits to this country so as to take advantage of the valuable opportunities afforded by this convention.

Three special steamers, chartered for the accommodation of delegates from abroad, will be provided for the ports on the Pacific ocean. Another steamer starting from New York, will go by way of the Panama canal.

Information regarding steamer routes, days of sailing and the program of the 1920 convention, is being furnished by O. K. Davis, secretary, National Foreign Trade council, No. 1 Hanover square, New York.

Addresses Foundrymen

H. D. Gates, of the Pangborn Corp., Hagerstown, Md., was the speaker at the regular monthly meeting of the Pittsburgh Foundrymen's association which was held at the Chatham hotel, Pittsburgh, Oct. 20. Mr. Gates' talk which was illustrated by lantern slides, was on "Application of the Sand Blast in General Foundry Work." Carleton S. Koch, president of the Fort Pitt Steel Castings Co., McKeesport, Pa., recently elected president of the American Foundrymen's association, talked briefly on the affairs of the American Foundrymen's association, its problems and aims. He intimated that there was some possibility of the next convention being held in Pittsburgh, provided an exhibition hall of sufficient size could be secured. Seven new applications for membership were presented.

Portable Furnace Burns Kerosene

The device shown in the accompanying illustration is a portable furnace designed to burn kerosene for heating rivets, tools, etc., giving a quick, hot flame. The furnace, which is a product of the Champion Kerosene-Burner Co., Kenton, O., is a self-contained unit with the fuel tank carried on the lower platform of the stand. These tanks are of various sizes, depending on the use to which the furnace is to be put.

Compressed air at a pressure of 90 pounds per square inch forces the fuel to the burner, which is located above the hearth. The fuel is transformed into a gas just previous to being ignited. Air for driving the fuel to the burner is forced into the tank by an air pressure hose or by a pump in cases where an air line is not available. The pressure is recorded by a gage located on the top of the tank.

NEW HEATING FURNACE

It is claimed that the furnace is economical as regards fuel consumption. Tests which were conducted for over a year indicated that with the furnace operating to maximum capacity, the fuel consumed did not exceed ¾ gallon per hour. These tests also showed that the flame gives a heat ranging from 2500 to 3000 degrees, Fahr., burning without any traces of hydrogen. This results in a nonoxidizing flame, which it is stated permits work to be left in the furnace for an indefinite period without danger of its burning up.

As no pipe connections from the furnace to a fuel supply source need be installed, the furnace with the flame in operation, can be lifted by a crane and deposited on another job in close proximity to the work that is waiting.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

WITH $50,000 preferred and $100,000 common stock, the Bossard Railway Signal Corp., Troy, N. Y., has been incorporated to manufacture railway signal equipment of all kinds. It has an exclusive license to market a system of signaling invented by two railroad engineers, Gisbert L. Bossard who is president and general manager of the company, and Rudolf Zaugg, who is its advisory signal engineer and serves on its board of directors. Other officers follow: W. Edward Hamilton, vice president; M. J. O'Sullivan, treasurer; John L. Lehman, secretary. Guy F. Swinnerton is a director and is the company's legal advisor. Mr. Bossard is a graduate in electrical engineering and has been connected with the railway signal equipment and allied industries for about 10 years in an engineering and sales capacity. Mr. Zaugg is in charge of the engineering department of the Federal railroads in Switzerland. Mr. Lehman is a graduate from Union college, Schenectady, N. Y., and until recently was senior inspector of metals at the United States arsenal at Watervliet, N. Y. The company intends to erect its own plant and desires to obtain trade information, catalogs, etc., regarding equipment. Its executive offices are located in the Frear building, Cannon place, Troy, N. Y. Negotiations for representation in England, France and Belgium now are under way. It is reported that over 300 miles of railroad in Europe utilize the signaling system invented by Messrs. Bossard and Zaugg and the company now is preparing plans for the installation of the system on a New York railroad with the object of submitting the system to tests by the interstate commerce commission, safety division.

* * *

ORDERS for complete tinning units for tin plate have been received from France and Japan by the Aetna Foundry & Machine Co., Warren, O.

* * *

COMPLETION of the largest contract in its history recently was achieved by the Weatherly Steel Co., Weatherly, Pa. The contract covered four steel barges for the United States government at a cost of $100,000.

* * *

CONTRACTS from Lacheze et Fils, Dijon and C. Markham & Co., Ltd., Chesterfield, England, for electric furnace installations, have been closed by the Electric Furnace Construction Co., Finance building, Philadelphia.

* * *

THE U. S. Fuel Co. will install a new steel head frame and screening plant, hoisting engine, engine house, concrete boiler stack, boiler room and power house at its Little Vermillion mine near Georgetown, Ill., at a cost of $100,000.

* * *

IN ORDER to care for its increasing Ohio business the J. W. Murray Mfg. Co., of Detroit, producer of auto parts, will establish an assembly plant in Cleveland. The expectation is that this plant will be in operation in about six weeks.

* * *

FOUNDED in 1832, the business of the Charles Parker Co., Meriden, Conn., manufacturer of screws, has grown rapidly. Its latest expansion comprises a 3-story, 50 x 200-foot, concrete addition to its plant. The contract for the construction already has been let.

* * *

THE Hills, McCanna Co., 153 West Kinzie street, Chicago, manufacturer of brass and aluminum castings, recently has acquired a plant at 2025 Elston avenue, Chicago. This plant affords ample space for the expansion of the company's machine shop and foundry.

* * *

IMPROVEMENTS to cost about $200,000 are under way at the north works of the American Steel & Wire Co. in Worcester, Mass. They include erection of an annealing plant, with 16 new annealing outfits, and alterations and additions to other buildings.

* * *

WHEN the Milton Iron Furnace Co., Wellston, O., resumes operation, it will be fully equipped and the plant will be thoroughly repaired. It is erecting a new draft stack, 150 feet high. A new stove also is being added to the blast furnace which will be 85 feet high, its present stove being 75 feet.

* * *

THE National Machine Co., Hartford, Conn., builder of presses and surface grinders, is to purchase the idle brick 2-story factory owned by the F. W. Robbins estate and formerly occupied by the Elmer Tool Co. in Wethersfield, Conn., and will open it within a few weeks, giving employment to 100 persons.

* * *

MACHINE tool specialties will be manufactured by the Sprague-Hayes Mfg. Co., 40-42-44 Leonard street east, Detroit, which recently was incorporated with $10,000 capital. At present the company does not contemplate the erection of a plant. Officers of the company are: President, E. W. Sprague; vice president, Fred Heal, and secretary, R. F. Hayes.

* * *

ON OCT. 6 and 7, 30 representatives from the different offices of the John F. Byers Machine Co., Ravenna, O., held their second annual sales conference at Ravenna. Matters pertinent to the manufacture and sale of the company's auto-crane were discussed and plans for 1920 were formulated. A new model of the crane was demonstrated.

* * *

AS CONTEMPLATED by the A. Garrison Foundry Co., Pittsburgh, its old foundry shortly will be entirely replaced by a new one which will be modern in every respect. One section 95 x 100 feet already is in operation and a section 95 x 120 feet is being added. When the second unit is complete, a third similar to the second will be added, after the remaining portion of the old building is demolished. While the improvements are being made, no loss in production is suffered. Arrangements are expected to be made for a new roll turning shop with twice the capacity of the company's present shop and an extension to its machine shop, likewise is being considered.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

GROUND has been broken at Watervliet, N. Y., for a new plant for the Troy Foundry & Machine Co., Inc., Troy, N. Y., successor to the West Side Foundry Co. The plant will be located on a 25-acre site, opposite the plant of the Troy Malleable Iron Co., which land was purchased by the Troy Foundry & Machine Co. about four years ago. The new building is expected to cost $100,000 and the company purposes to have it completed by Jan. 1, 1920. John T. Starkweather is vice president and general works engineer and will have charge of the construction. Charles A. Sleicher is president and general manager and through his aggressive administration the business has grown so rapidly that this expansion became necessary. Among the large contracts closed recently by the Troy company are one from the Gilbert & Barker Mfg. Co., Springfield, Mass., maker of automatic gasoline tanks, and one from the Sprague Electric Co., Bloomfield, N. J.

* * *

TO CONDUCT a general coal and coke jobbing business as well as to mine coal, the Continental Fuel Corp., Fayette Title & Trust building, Uniontown, Pa., has been incorporated at $25,000. So far the construction of the company's plant has not commenced. The officers follow: President, Frank E. Tuit; vice president, Charles A. Tuit; secretary and treasurer, Paul B. Hickman.

* * *

ACCORDING to an announcement by Vice President and General Manager H. M. Steel, of the Newton Steel Co., Newton Falls, O., the new plant rapidly is nearing completion. It is expected that production of steel will commence by April 1, 1920, and possibly before. It is the intention of the company to employ 600 or 700 men at first and gradually to increase that number.

* * *

AFTER Charles Sorenson, M. L. Bricker, C. R. Brubaker and O. A. Anderson, of the Ford Motor Co., Detroit, had inspected the Ford tractor plant at Hamilton, O., Mr. Sorenson announced that the installation of $1,500,000 worth of machinery is to commence at once and that by the first of next February the plant would be placed in operation, giving employment to 600 men.

* * *

TO PERMIT the better handling of its increased business in high speed steel, carbon tool steel, spring steel, music wire, drill rods, alloy steels, shafting, etc., the Aborn Steel Co., Inc., New York City, has completed its new warehouse and office at 22-24 Clarke street. Other warehouses and offices are located in Boston, Buffalo, Philadelphia, Pittsburgh, Rochester, N. Y., and San Francisco.

* * *

WITH an authorized capital stock of $200,000 the Hudson Mfg. Co., Janesville, Wis., has been organized by Frank B. Strickler and J. C. Strickler, owners of the Strickler Hay Tool Co., and J. E. Cox, also of Janesville. The new concern virtually is a reorganization. The line of hay tools will be enlarged to include farm machinery, barn equipment, etc. Additions to the present Strickler plant will be made at once.

* * *

ARTICLES for religious purposes will be manufactured entirely from metal by the O. N. J. Novelty Mfg. Co., New York, which recently was incorporated with $25,000 capital. The company was chartered by John Jacobs, M. S. Ornstein and A. Ornstein. According to advices from A. Ornstein, who owns the controlling interest in the firm, the company will manufacture its products from a metal of its own composition.

* * *

THE International Earth Boring Machine Co., of Chicago, manufacturer of an appliance designed to be used when mounted on motor trucks for making post holes for transmission lines, fences, etc., has purchased a site for its plant adjacent to the works of the Winther Motor Truck Co., at Kenosha, Wis. This is being done to facilitate the execution of a large order for combination trucks and digging appliances which has been placed by the American Telephone & Telegraph Co., it is reported. The site embraces 17 acres. Details of buildings to be erected have not been issued. Initial construction and plant equipment work is estimated to cost at least $250,000.

* * *

PURCHASED from Oscar Baur by the Fitzsimons Steel & Iron Co., Chicago, manufacturer of cold-drawn steel, etc., 17 acres on Kedzie avenue, between the south branch of the Chicago river and the Chicago & Illinois Western railway at Thirty-third street, will furnish space for expansion. The tract fronts over 700 feet on Kedzie avenue and has a depth of 1300 feet on the railway. It will become the site for a large manufacturing plant equipped with electric cranes, etc., as well as other labor-saving machinery.

* * *

CONSTRUCTION of a new plant for the Sterling Mfg. Co., Cleveland, manufacturer of ammeters and voltmeters, is nearing completion, and is expected to be ready for occupancy within three weeks. The building, which is of reinforced concrete construction, is two stories, 65 x 100 feet, and provision has been made for the erection of another story, if such should be found necessary. In addition to this structure, the company now is planning to erect an office building, 60 x 75 feet, and expects to start construction shortly.

* * *

FOR the purpose of making truck bodies and cabs for selling to the leading truck manufacturers, the Fitz-John-Erwin Mfg. Co., Muskegon, Mich., has been incorporated with $100,000 capital. The company's engineers now are at work on special designs and at present is making commercial bodies and cabs according to specifications furnished by the truck manufacturers. A woodworking plant with about 25,000 square feet of floor space and a site of six acres have been obtained. President H. A. Fitz John formerly was production manager of the Continental Motors Corp., and later, directed the purchases of the Dayton Wright Airplane Co. W. C. Powell is vice president; L. B. Erwin, secretary, and T. H. Hume, treasurer.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

TRUSTON P. DRAPER, who has been appointed general superintendent in charge of operations in all of the properties of the Sharon Steel Hoop Co., Sharon, Pa., succeeds George W. Short, who recently resigned. Mr. Draper is an operator of broad and general experience. He was graduated from Yale university in 1903 and immediately entered the steel business in Youngstown, O., being for some years with the Republic Iron & Steel Co. in various capacities in its blast furnaces, steel plants and rolling mills. In 1906 Mr. Draper became affiliated with the Inland Steel Co., at Indiana Harbor, as assistant general superintendent. He then returned to the Youngstown district as assistant superintendent of blast furnace and steel departments of the Youngstown Sheet & Tube Co., where he spent a number of years. Until recently, for about two years past, he has been identified with the Trumbull Steel Co., Warren, O.

Edward O. Werba has become affiliated with the Meriden Iron Co., Hibbing, Minn.

W. H. Schoen recently was elected president of the Pittsburgh Knife & Forge Co., Pittsburgh, succeeding P. A. McBride.

Maurice Kenyon has resumed his duties as purchasing agent for the New Departure Mfg. Co., Bristol, Conn.

K. K. Hood of the American Zinc Lead & Smelting Co., has been transferred to the American Zinc Co., of Tennessee, at Mascot, Tenn.

Charles H. Schmalz who recently resigned from the Hanna Engineering Works, Chicago, has become assistant factory manager of the Holt Mfg. Co., Peoria, Ill.

C. W. Cross, has been appointed by the Chicago Pneumatic Tool Co., Chicago, as manager of western railroad sales with head quarters at Fisher building, Chicago.

H. G. Hilton, who has been identified with the United Furnace Co., Canton, O., now is connected with the Steel Co., of Canada, Hamilton, Ont.

Phillip L. Getzinger, formerly with Edgar Allen & Co., recently was made manager of the Chicago branch of the Vulcan Crucible Steel Co., with offices at 16-18 South Clinton street, Chicago.

J. B. Throckmorton has been appointed to have charge of the New England district for the Lyon Metallic Mfg. Co., Aurora, Ill. His headquarters will be in the new branch sales office established at 161 Devonshire street, Boston.

B. F. Harper, formerly connected with the sales organizations of the Republic Iron & Steel Co. and the Ft. Wayne Rolling Mill Corp., Fort Wayne, Ind., has associated himself with Roland T. Meacham, Guardian building, Cleveland, investment broker.

Hugo Ritter Von Wessely, vice president and treasurer of the Rowe Calk & Chain Co., Plantsville, Conn., has resigned and will return to Austria, where his mother resides. Mr. Von Wessely has been with the company eight years and was in charge of its western sales office in Chicago.

S. W. C. Fitts, for the past two years superintendent of the Worcester Stamped Metal Co., Worcester, Mass., has resigned to accept a similar position in Los Angeles. He is succeeded by Victor Carlstrom, who comes from the Wire Wheel Co. of America, Buffalo.

Harry E. Figgie recently became sales manager for the Perfection Spring division of the Standard Parts Co., Cleveland, succeeding W. P. Culver, resigned. For the past few years, he has been sales engineer at that plant, prior to which he was assistant superintendent.

F. J. Buller resigned recently as treasurer of the Canadian National railways to accept the position of vice president and manager of the Canadian Steel Tire & Wheel Co., which will establish a large plant for the manufacture of locomotive and passenger car wheels at Montreal, Que.

Joseph H. S. Lynde, for the past 20 months supervising and safety service engineer for the Worcester Pressed Steel Co., Worcester, Mass., has resigned to accept a position of greater responsibility with the American Tube & Stamping Co., Bridgeport, Conn., Mr. Lynde formerly was a district engineer for the Westinghouse Machine Co., Pittsburgh.

George W. Goethals, builder of the Panama canal, has been elected president of the American Ship & Commerce Corp., New York, which recently was organized as a combination of the Wm. Cramp & Sons Ship & Engine Building Co., and the Kerr Steamship Co. Kermit Roosevelt, son of the late ex-president Theodore Roosevelt, is secretary for the corporation.

F. M. English has been appointed district sales manager in charge of the sales office recently established in Pittsburgh by the Reading Iron Co., Reading, Pa. R. A. Griffin is district sales manager in charge of the new Chicago branch sales office. Craig Geddis has been appointed advertising manager for the company and W. E. Dunham is production manager.

E. C. Morse, former assistant director of sales of the war department, Washington, has been made director of sales following the resignation from the latter office of C. W. Hare. Mr. Hare also was assistant director of munitions, but no successor to the latter office will be named. It was announced by Secretary of War Baker that the resignation of Mr. Hare was due to an indisposition which prevented his personal participation in the activities of his offices.

George S. Hewins, who has been general manager in the construction of ships for the United States shipping board at the yard of L. H. Shattuck, Inc., Portsmouth, N. H., since the United States entered the war has become general engineer in charge of construction of the system of the New England Power Co., with headquarters in Worcester, Mass. He succeeds Col. George W. Bunnell, who was president of the Power Construction Co., a subsidiary and who resigned last month to go to Santo Domingo, West Indies, as general manager of the Barahoma Co. At the outbreak of the war Mr. Hewins was engaged as chief engineer for the British Chemical Co., Trenton, Ont.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

GUY E. TRIPP, chairman of the Westinghouse Electric & Mfg. Co., East Pittsburgh, has been elected a director of the American International Corp., succeeding J. Ogden Armour. Mr. Tripp was one of the original directors of the American International Corp., but resigned upon entering the ordnance department of the army. He has been chairman of the Westinghouse Electric & Mfg. Co. for more than seven years.

H. W. Ross has been elected vice president of Templeton Kenly & Co., Ltd., Chicago, manufacturers of jacks.

L. A. Muttart has been made manager of the Chicago railroad sales department of the Western Electric Co., Inc., Chicago.

Edgar Reed, president of the Reed & Prentice Mfg. Co., Worcester, Mass., who has been on a three months' business trip to Europe, sailed for home Oct. 16.

Carl F. Dietz, sales manager of the Norton Co., Worcester, Mass., has left for Europe to look after the personnel and sales methods in France, Belgium, Germany and England.

William H. Savage, builder of machine tools, and Everett E. Wilbar, assistant treasurer of the Union Foundry Co., both of Fitchburg, Mass., are among the incorporators of the People's Trust Co., of that city.

Olof Ostlin, superintendent of the Bolinger Co., Ltd., Stockholm, Sweden, builder of crude oil engines, accompanied by P. Kindberg, a mechanical engineer of Stockholm, are in this country buying machinery.

James A. Carr, president of the American Seeding Machine Co., has been made a chevelier of the Legion of Honor of France for his services as business manager of the allied purchasing committee in Washington during the world war.

J. H. Deppeler, of the Metal & Thermit Corp., has been elected a vice president of the American Welding society, and P. F. Willis, president of the Henderson-Willis Welding & Cutting Co., has been elected a director of the society.

R. M. Dravo, of the Dravo-Doyle Co., Pittsburgh, and who was chief of the Pittsburgh district ordnance office during the war, received the distinguished service order medal from the war department last Friday in Washington.

Walter McCrum, who recently resigned as assistant manager of the Clark Electric Mfg. Co., Middletown, Conn., has accepted a position with the Haytian American Corp., which controls the electrical output of the island of Hayti, West Indies, and has left to take up his new duties.

Col. W. A. Starrett, who served throughout the war as chairman of the emergency construction committee of the war industries board in Washington, has been elected a vice president and director of the George A. Fuller Co., general contractor, New York, Boston and elsewhere.

R. Sanford Riley, president of the Sanford Riley Stoker Co., Ltd., Worcester, Mass., arrived in New York, Oct. 17, on the ADRIATIC after a two months' European trip in the interests of his own company and also the Norton Co., Worcester, of which he is a director. He returned to Worcester this week.

Arthur E. Barr has been appointed employment manager of the Heald Machine Co., Worcester, Mass., to succeed Harry W. Cobb, resigned. Frank Greiner, who has been with the Heald company for three years, has resigned as chief service engineer. L. C. Kenyon, who has been handling its New England territory for the past two years is to be transferred to Chicago to assist G. A. Pabst. He will be succeeded by M. F. McCormick, formerly with the Sperritt & Stoer Co., Philadelphia.

Albert H. Zimmerman, who for 14 years has been affiliated with the Continental Motor Co., Detroit, recently was made vice president, treasurer and general manager of the Supreme Motors Co., Warren, O. Mr. Zimmerman is 36 years old and began his business career as auditor and factory accountant for the Continental company. At that time the factory output was about 100 motors annually and this since has grown to 160,000. In 1912 he was made secretary and treasurer and a member of the board of directors as well as of the executive committee. He resigned in 1918 to take a much needed rest.

George H. McDade recently became affiliated with the Pratt & Whitney Co., Hartford, Conn., maker of machine tools and small tools, etc., in its main office. He has had a wide experience along mechanical lines and as a shop executive. He served as an apprentice and journeyman first with the Allentown Foundry & Machine Co., Allentown, Pa., and the Allentown Wire Co. Later he was chief inspector in charge of the time setting for the Bethlehem Steel Co., and became superintendent of the crane department at Philadelphia for the Niles, Bement, Pond Co., serving from 1901 until 1906. Special work for the Westinghouse Electric & Mfg. Co. took up the next four years and he then in turn became superintendent of the automobile department of the Flint Wagon Works; master mechanic of the engine department of the Buick Motor Co.; engine shop superintendent with the Hudson Motor Car Co., Detroit; factory manager with the Northway Motor & Mfg. Co., that city, and then back to Flint, Mich., to do some special work for the Buick company.

Charles W. Forcier, who for the past three years has been purchasing agent of Mackintosh, Hemphill & Co., Pittsburgh, recently resigned and has opened offices in the Union Arcade building as a sales engineer, in which capacity he will represent in western Pennsylvania, West Virginia and eastern Ohio, the Crucible Steel Forge Co., Cleveland, and the Exeter Machine Works, Inc., with a plant at Pittston, Pa., and executive offices at 30 Church street, New York. Before becoming identified with Mackintosh, Hemphill & Co., Mr. Forcier was with the Pittsburgh Railways Co. in the capacity of storekeeper. He has been treasurer of the Purchasing Agents' association of Pittsburgh for the past two years and will retain this position until the annual meeting of the association next month. Frederick K. Acker, who has been assistant purchasing agent of Mackintosh, Hemphill & Co., Pittsburgh, has been promoted to the position of purchasing agent, succeeding Mr. Forcier.

U.S. Exports Excess Is Dwindling

September Foreign Trade Figures Show Unprecedented Imports and Slightly Smaller Exports—Shipments to Nonallied Europe Up 400 Per Cent and to Allies But 6 Per Cent, Records Show—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

EXPRESSIONS of sentiment at the international trade conference at Atlantic City last week and the Manufacturers' Export association in session in New York the week before, that a restored equilibrium for world trade and upset foreign exchange depended upon increased imports and diminished exports for the United States, were echoed in the report of September exports and imports given out by the bureau of foreign and domestic commerce.

In it, American shipments abroad were seen to have declined 8 per cent while imports increased 28 per cent. Exports for September were valued at $593,000,000, a drop of $53,000,000 from the August total and of $335,000,000 from the June high record. In September of 1918 the exports were $550,000,000. It is interesting to note in this connection that England's exports for the same month exceeded those in August by $131,000,000 and those in September of last year by $304,000,000, all of which indicates the success that is attending the herculean efforts Great Britain is putting forth to recapture her foreign markets. Of the $1,009,000,000 increase in British exports for the nine months of the year, however, only $168,000,000 have come to the United States, the remainder representing sales to other parts of the world.

The fact that the September excess of exports for the United States was $158,000,000, which is smaller than any September since 1915 and less than any export monthly export balance since that date but two, is due to the advance in imports rather than the fall of exports the record shows. Imports last month attained the unparalleled figure of $435,000,000. This is $92,000,000 higher than the previous record established in June of the present year. The high level before the war was $184,000,000 for June, 1913. Only a portion of the increase over this figure can be accounted for by inflated prices.

How normal laws are working steadily toward the end of reducing this country's excess of exports and bringing the current foreign trade situation more into balance, with a consequent recovery in the exchange rates, is revealed in monthly record of trade balances for the year. The excess of exports for September of $158,000,000 is at the rate of $1,896,000,000 annually, as compared with the excess for January of $409,560,000 or at the annual rate of $4,908,000,000. How the excess is being hammered down, more by greater imports than by smaller exports, is disclosed in the following table, the last 000 being omitted from the figures:

	Exports	Imports	Excess exports
September	$593,000	$435,000	$158,000
August	646,258	307,331	338,917
July	570,082	343,999	226,083
June	918,252	293,069	625,183
May	604,896	328,927	275,969
April	714,513	272,956	441,557
March	604,912	267,588	337,324
February	585,097	235,171	349,926
January	622,552	212,992	409,560

Although it may seem strange that the exports remain so high despite the drastic exchange rates, a study of the destination of shipments clearly shows the effect of depressed exchange. Increased sales to Europe have gone to neutrals and to the central powers, rather than to England, France and Italy where especially in respect to the last two the exchange premium is next to prohibitive. Exports to the neutrals have increased approximately 400 per cent, or from $206,000,000 to $1,009,000,000 for the first eight months of the year while those to the allies have advanced but 6 per cent or from $2,329,000,000 to $2,488,000,000. For all of Europe exports have increased 41 per cent during the period and for the rest of the world 28 per cent.

How exchange rates are affecting exports to Italy where the premium on the dollar is 48 per cent is seen in the 21 and 31 per cent drop in imports from America for July and August respectively, while in France where the premium is 40 per cent the decrease was 37 and 28 per cent, respectivly, for the same months. Sales of 57,000,000 have been made to the Teutonic allies this year.

It is certain that the allies will not buy any thing but indispensable material in this country but even this will amount to a huge total, according to estimates made at the trade conference last week. Much steel and other materials will be needed to the extent, it is computed, of $2,750,000,000 before next summer. Secretary Redfield, at the conference, advocated the formation of a $500,000,000 foreign financing corporation to extend the credits necessary to make the exports possible.

The importance of keeping additional credits at a minimum and of pushing export trade in other parts of the world outside of allied Europe is made apparent when it is realized that the ultimate debt Europe will owe this country will probably reach $14,500,000,000, of which more than $10,000,000,000 will represent government advances and the remainder private loans previously extended together with those to be made to finance reconstruction.

Reporting out by the house committee last week of the Edge bill recently passed by the senate, brings the financing corporation project one step nearer. The first big foreign financing move since the armistice was made last week by J. P. Morgan & Co. in offering $250,000,000 British loan. Although foreign representatives at the Atlantic City conference were pledged the financial support in reconstruction, the success the British loan meets at the hands of investors will be the real index to future plans in this direction.

Great activity of the stock market characterized by advances of steel shares last week attracted much attention. On one day Republic Iron & Steel gained over 16 points. A part at least of the advance was believed due to the belief that the Supreme court would decide that stock dividends are not income and not taxable as such in the Towne case now before it. Arguments have been presented and the decision is due within a few weeks. A number of steel companies are known to have stock dividend declarations under contemplation and, provided the case is decided satisfactorily, distributions will be made.

Bethlehem Buys Elkins Coal & Coke Co.

Directors of the Bethlehem Steel Corp. at their meeting Oct. 23, an-

nounced the purchase of the Elkins Coal & Coke Co., a West Virginia corporation, owned and operated by the heirs of the late Senator Stephen B. Elkins. With respect to the purchase, the Bethlehem Steel Corp. announces:

"The property consists of 46,000 acres of coal land in West Virginia, with coal reserves of more than 150,000,000 tons. The property is equipped and developed for an annual output of 1,500,000 tons of coal, which will be increased to 3,000,000. Acquiring of the Elkins company by the Bethlehem interest, in conjunction with their present sources of supply, provides the corporation with its full requirements for coking, heating and steam coal.

"The shipbuilding plants of the corporation are operating at full capacity with no diminishing of orders on hand. New business is being booked at a rate in excess of billings.

"The steel plants, other than the rail mills, are running at full capacity, with an increasing volume of new business offering. The railroad buying is still below normal, but general commercial lines are rapidly filling the capacity usually operating on railroad orders.

"The corporation is continuing its program of extensions and additions to plants, having spent to date this year over $15,000,000 for new construction. A number of new plants are just now coming into operation and over the next five months a material increase in capacity will become available."

Pullman Earnings Under U. S. Control Less

Net profits of $12,730,057 were earned by the Pullman Co. during the year ended July 31, as compared with $13,402,205 for the previous, the annual report of the company shows. The operations of the company were under government control during the period and provisions for depreciation is missing from the income account. It is explained that this item accrues under the contract with the director-general. The company's compensation under federal operations has dropped off enormously. The financial position, however, is strong, with quick assets of $59,392,837 and net working capital of $30,844,743 against a net working capital of $21,169,743 in 1918.

The balance sheet of the corporation shows a loss of 94 cars and equipment, but the valuation was listed only $107,450 less. Securities held increased $600,000, while bills and accounts receivable grew from $3,629,577 last year to $10,423,721 in 1919. Accounts payable, however, expanded from $2,946,925 to $5,017,506. Total assets showed a gain of around $11,000,000 to the total of $171,254,870. Following is the comparative consolidated income account:

	1919	1918
Rev. from cars		*23,287,251
Fed. comp.	$11,750,000	†6,854,166
Ret. from mfg. inter., etc.	3,689,935	3,216,761
Gross income	$15,439,935	$33,358,178
Expenses and taxes	2,709,878	‡17,348,081
Depreciation	§	2,607,891
Balance	$12,730,057	$13,402,206
Dividends	9,599,792	9,599,792
Surplus	$3,130,265	$3,802,414

*Revenues from earnings of cars for five months ended Dec. 31, 1917.

†Federal compensation, seven months ended July 31, 1918.

§Provisions for depreciation during federal control accrues under the contract with director-general of railroads, and does not appear under expenses in income account.

‡Includes operating expenses, repairs of cars, taxes, and insurance for five months, amounting to net balance $13,646,027, and corporate expenses and taxes for seven months ended July 31, 1918, amounting to $3,664,666. the latter amount also including items of expense and taxes prior to Jan. 1, 1918.

Form New Export Concern

A statement just filed with the federal trade commission gives the details of the organization of the Namusa South American Corp., under the Webb Pomerene law for the purpose of exporting chemicals, agricultural implements, construction materials, hardware, machinery, machine goods, mill supplies, scientific and industrial implements, silverware and metal goods, etc. The plan of organization provides for $50,000 common stock par value $100, of which $3900 has been issued; 500 shares no par value authorized, issued at $100 a share, and a capital of $2500 to begin with.

Officers of the company are: President, R. H. Fullerton; vice president and treasurer, O. P. Hollander; secretary, E. F. Tompkins. Among the directors listed as W. H. Cowdery, chairman of the board, who is also president of the American Fork & Hoe Co., Cleveland; Albert C. Lehman, president of the Blaw-Knox Co., Pittsburgh; H. Read, president of the Read Machinery Co., Inc., York, Pa.; and Dr. Edward Weston, president of the Western Electrical Instrument Co., Newark, N. J.

Among the companies holding one or more shares of stock are the American Fork & Hoe Co., Cleveland; Bethlehem Fabricators, Inc., Bethlehem, Pa.; Blaw-Knox Co., Pittsburgh; Excelsior Hardware Co., Stamford, Conn., Read Machinery Co., Inc., New York; Rowe Calk & Chain Co., Plantsville, Conn.; Urschel Valve Mfg. Co., Toledo, O.; and the Western Electrical Instrument Co., Newark, N. J.

Curtiss Assets Decline

Total assets of $16,072,220 are reported by the Curtiss Aeroplane & Motor Corp. in its annual statement for the year ended June 30. This represents a shrinkage from the total of $24,343,054 at the end of 1918. A reduction from $6,484,600 to $610,540 is reported for the inventory account. Accounts and notes payable are reduced from $4,907,873 to $254,229.

Cash on hand compares $2,858,390 with $669,238 last year, while accounts and notes receivable show a falling off from $7,503,404 to $2,740,744. The reserve for taxes is $700,000 less, at $500,000. The profit and loss surplus stands at $2,271,020, against $681,095 at the close of 1918.

The company is retiring 5369 shares of its preferred stock at 110 and the accrued dividend, in accordance with sinking fund provisions, and it has extinguished its funded debt of $4,788,235. The company owes $4,000,000 to the United States government on account of advances on war contracts, but this will be liquidated when these contracts are settled. A bill has been introduced in congress to settle the government's contracts with the company at $6,114,126 and purchase the Buffalo plant of the corporation.

Financial Crop Ends

THE Spicer Mfg. Co., South Plainfield, N. J., has purchased the Parrish Mfg. Corp., with plants at Detroit and Reading, Pa., makers of automobiles, trucks, frames, and the Sheldon Axle & Spring Co., Wilkes-Barre, Pa. The authorized capital will be $2,000,000 preferred stock; $5,000,000 common stock; $3,000,000 surplus and $3,000,000 one to five year serial 6 per cent notes which have been purchased by the company's bankers.

* * *

A favorable vote to increase the capital stock from $1,500,000 to $2,000,000 has been taken by the stockholders of the North & Judd Mfg. Co., New Britain, Conn. The proceeds will finance the W. & E. T. Fitch Co., New Britain, which the company recently acquired.

* * *

A new organization which it is said will include 90 per cent of the safety razor business of the world, has just been affected in Boston. The consolidation involves the Gem, the Ever-Ready, and the Star Safety Razor companies. The new company will be known as the American Safety Razor Co., with an authorized capital of $20,000,000.

Prospective Tool Business Large

Closings at Present Represent Many Small Tools and Much Light Equipment—Large List Out From General Electric, American Car and Foundry and Chevrolet Motor Companies—Sizable Crane Business Pending

MUCH space is being taken up in order books of machine tool and equipment sellers today, although the aggregate value is not surprisingly large. This is by reason of the fact that most of the sales made are for light equipment or for small numbers of small tools. Answers to the numerous inquiries being received are taking much of the dealers' time and in some cases mean working after regular hours. This prospective business looms large, however, and presages well for the late fall and winter months. While it is probable that a coal strike will affect the machinery market somewhat, the fact that the steel strike practically has fallen through promises to produce much equipment business at an early date.

Sizable orders at times interrupt the continuity of the smaller ones in practically all districts. Lists issued by the General Electric Co., Schenectady, N. Y.; American Car & Foundry Co., New York City, for shops at Depew, N. Y., Buffalo and Chicago; Chevrolet Motor Co., Bay City, Mich., aggregate about $100,000 worth each. A large list is expected from the Willys Corp., which is enlarging its Elizabeth, N. J., plants, involving an expenditure for buildings and equipment of about $4,000,000. Much special machinery will be bought. The company recently purchased 10 special machines. Other buyers, prospective and actual, include the J. H. Williams Co., Brooklyn, N. Y., manufacturer of drop forgings; S. P. Townsend & Co., Orange, N. J., manufacturer of lawn mowers, etc.; Empire Axle Co., Dunkirk, N. Y.; American Motors Co., Plainfield, N. J.; E. W. Bliss Co., Brooklyn, N. Y., for Hastings, Mich.; Ellis Motor Car Co., Newark, N. J.; H. H. Franklin Co., Syracuse, N. Y.; Nash Motors Co., Milwaukee, Wis.; Samson Tractor Co., Janesville, Wis.; the Stromberg Motor Devices Co., Chicago, and a large number of automobile manufacturers in Detroit, including Dodge, Hudson, Ford, Cadillac and Packard.

Railroad purchases of machinery requirements slowly are taking form and further legislation looking toward the return of the railroads to private ownership seems an early possibility. Against such action railroad purchasing agents are lining up their 1920 requirements. The Santa Fe railroad has made some minor purchases already but most of the inquiries are tentative. These include some from the Pennsylvania lines west and the New York Central. The Stark, O., shops of the former road are said to be ready for machinery but many purchases yet have to be made. One steel fabricator in the Chicago territory bought $12,000 worth of tools. In that district there seems to be a large demand for sheet metalworking machinery with a consequent lack of punch presses.

Some slight stir exists in the eastern crane market. The American Car & Foundry Co. wants five cranes for Chicago and three for Buffalo. The Kennedy-Van Saun Mfg. Co., New York, wants seven cranes of various sizes. The Newton Machine Tool Works, Inc., Philadelphia, wants electric cranes, as does the Empire Axle Co., Dunkirk, N. Y. The Harley Co., Springfield, Mass., wants four and the Midvale Steel & Ordnance Co. is reported to be in the market for a like number for Johnstown, Pa. Three cranes are wanted by the Leffel Mfg. Co., Springfield, O. The American Tube & Stamping Co., Bridgeport, Conn., wants a traveling crane and a gantry crane is wanted by A. Bentley & Son, Toledo, O.

Past Month Has Been Active for Eastern Sellers

OCTOBER, now closing, is regarded by the eastern machine tool trade as one of the most satisfactory months so far this year. Inquiry has been well in excess of several of the preceding months, and buying has been of good volume, for in addition to several sizable orders, there has been considerable small miscellaneous business. Possibly the most significant development has been the interest displayed by the automotive and allied industries. This has been manifested in the Middle West for sometime past, but not until recently has it been in evidence in the East. The biggest inquiry, however, to come out from these sources, that of the New Departure Mfg. Co., Bristol, Conn., continues pending.

Other branches of industry are also represented by sizable inquiries. The General Electric Co., with the addition of a list just issued, is in the market for approximately $100,000 worth of equipment for its Schenectady, N. Y., plant, and is expected to bring out another list within the next few days. Another large inquiry is that of the American Car & Foundry Co., 165 Broadway, New York. Machine tools aggregating a similar amount are desired for its plants at Buffalo, Depew, N. Y., and Chicago, in addition to considerable fabricating equipment. The E. W. Bliss Co., Brooklyn, N. Y., continues in the market for machine tools for its plant at Hastings, Mich., already having placed some business. The J. H. Williams Co, manufacturer of drop forgings, also of Brooklyn, N. Y., has been a buyer of the past week.

A large list is expected shortly for the Elizabeth, N. J., plant of the Willys Corp. Plans have been completed

Say you saw it in THE IRON TRADE REVIEW

for additions, estimated to cost, equipped, around $4,000,000. It is believed that purchases will involve much special machinery. The company recently bought 10 special machines. The Ellis Motor Car Co., Newark, N. J., will require a few tools for a repair shop. The H. H. Franklin Mfg. Co., Syracuse, N. Y., has taken a long term lease on a building which it will convert for manufacturing purposes.

Possibly the largest inquiry to come out recently in the eastern crane market is that of the American Car & Foundry Co., calling for two 5-ton and three 10-ton overhead cranes, with spans of 50 and 90 feet respectively, for Chicago; and one 10-ton crane, with 100-foot span, and two 10-ton cranes, with 90-foot span, for Buffalo. It is understood this list absorbs the 10-ton crane with 90-foot span, recently inquired for. Another sizable list now pending in the East is that of the Kennedy-Van Saun Mfg. Co., 120 Broadway, New York, manufacturer of crushers. This list involves one 5-ton, one 10-ton, three 20-ton, and two 30-ton cranes. The spans involved are 24 and 60 feet.

Although no award has been announced, it is reported that bids on a 10-ton overhead crane, with 75-foot span, for the Stanley Works, New Britain, Conn., have been closed. The Harley Co., Springfield, Mass., has bought two Shepard and two Curtis cranes. The cranes were of two tons capacity, with spans of 24 feet. The Leffel Mfg. Co. is reported to have placed one each, 5, 10 and 20-ton overhead cranes for its plant at Springfield, O., with the Case Crane Co. An unconfirmed report of interest to the trade is to the effect that the Midvale Steel & Ordnance Co. has placed four 10-ton overhead cranes for its plant at Johnstown, Pa., with the Alliance Machine Works, Alliance, O. The Midvale company also has been inquiring for a 75-ton ladle crane, with 47-foot span, and two heavy ladle trolleys.

The American Tube & Stamping Co., Bridgeport, Conn., continues in the market for a 5-ton traveling crane with 25-foot span. A. Bentley & Son, Toledo, O., contractors, are inquiring for a gantry crane.

Labor Troubles Make Buyers Withhold Orders

ACTIVITY in machinery and tools in the Pittsburgh district continues more prospective than actual. With a strike of the coal miners coming on just as the steel strike was considered to be practically broken, hopes do not run particularly strong that much of the prospective business will materialize in the immediate future. Numerous inquiries for cranes are out, but few if any of them are being closed because of the labor situation. Dealers in tools report a fair amount of sales from the floors, but no new inquiries of any account. The Pennsylvania railroad, lines west, is putting out tool inquiries almost daily, but is closing on few if any of them. It is said that the Stark, O., car shops of this railroad is practically completed and ready for the installation of equipment but that most of it still is to be ordered.

Prospects for Winter Trade Good

BUYING of machine tools in the Chicago market continues excellent with prospects for winter trade being heavy. As has been the case for some time, most buying is of single tools or a small number but in addition to this several large consumers are covering their requirements by a series of orders. The Nash Motors Co. is preparing its first installment of requirements for the new plant being built at Milwaukee, and figures will be considered shortly. This is not expected to cover more than a small part of its eventual purchase. The Samsom Tractor Co., of the General Motors Corp., at Janesville, Wis., continues to spread its business, which has run into a large sum. The Santa Fe railroad recently placed an order for two shapers, one of the few recent purchases by railroads.

A fabricating concern recently placed an order for a heavy punch which represented an outlay of about $12,000. Another sale recently made was of a 60-inch planer with reverse motor, which also involved a large expenditure. Much demand is being made for heavy sheet metal-working machinery so much so that punch presses are almost unobtainable. Demand for soft drinks has stimulated activities of soda fountain supply manufacturers and the Liquid Carbonic Co. recently bought a large quantity of equipment for making holders for gas and charged water. This represented lathes, drills and other machinery for working copper, brass and steel. The Stromberg Motor Devices Co., Chicago, recently closed for considerable equipment.

Machine Tool Sellers Active in Cleveland

TRADING among Cleveland machine tool sellers at present consists mainly of small equipment and lighter tool sales. Despite great activity the aggregate value of orders placed seemingly is not commensurate with the energy expended. Much business, however, is prospective. Inquiries are numerous, so much so for one dealer that notwithstanding the combined effort of his clerical force, some of Friday and Saturday's voluminous mail had to be held over until Monday of this week. Action by purchasers on many of these inquiries will be delayed until the labor situation becomes definitely more settled. It is thought that if the impending coal strike becomes an actuality and is extended, its effect will be noted in decreased sales of equipment.

Larger inquiries come from the Detroit automotive field. About $100,000 worth of equipment is being inquired for and ordered by the Chevrolet Motor Co., Bay City, Mich. Dodge Bros., Detroit, has been a recent purchaser and an addition in course of erection will require more machinery. The Packard Motor Car Co., and the Paige-Detroit Motor Car Co., as well as the Ford Motor Co., and the Hudson Motor Car Co., Detroit, continue to figure among the larger purchasers of machine tools, etc. It is understood that the Ford tractor plant at Hamilton, O., now is ready for the installation of $1,500,000 worth of machinery. Much of this is on order but it is reported that a considerable amount still has to be specified. Machine shops for the Detroit Motor Car Co., Detroit, 275 x 528 feet; Escanaba Motor Car Co., Escanaba, Mich., 100 x 120 feet, and the Novo Engine Co., Lansing, Mich., 130 x 160 feet, all are about to issue lists of equipment requirements or have already done so. The National Spring & Wire Co., Grand Rapids, Mich., is installing machinery in its new plant. Presses, etc., will probably be required by the Jackson Stove & Stamping Co., Jackson, Mich., recently incorporated by Walter V. Sherwood and others at $200,000. The Gilmore Marine Motor Corp., 404 Twenty-fourth street, Detroit, is to increase its output of marine motors and this will necessitate the addition of considerable equipment. The Lemnar Mfg. Co., Saginaw, Mich., paper-baling machinery, is erecting an addition, quadrupling its capitalization to $200,000.

From outside of what is known as the Cleveland-Detroit territory, come a few inquiries which are of interest to dealers. Present equipment of S. P. Townsend & Co., Orange, N. J., manufacturer of lawn mowers, ball bearing mowers, etc., is to be doubled. A new building

FARRELL-CHEEK

Steel Castings

THE CONSULTATION

Between expert Engineer and Metallurgist is the real beginning of a Farrell-Cheek Steel Casting.

Here the tensile strength, thicknesses, pattern, etc—are discussed—and the alloys and ingredients determined.

From the time the blue prints and specifications leave their experienced hands until the casting is finished and examined for the last time—the same skilled care is given to each detail with the result of uniform smooth castings, specially suited to the particular needs.

Isn't *that* the casting you want?

Farrell-Cheek Steel Foundry Co.

Makers of Steel Castings that are a little better than the next best.

Sandusky, Ohio., U. S. A.

MEMBER OF

providing 70,000 additional square feet of floor space is being erected and a formal list of equipment requirements is expected soon. A fair sized list is issued by the Empire Axle Co., Dunkirk, N. Y., which is to double its present output of worm drive axles. Machinery, machine tools, electric cranes, power apparatus, etc., all will be purchased. Considerable equipment will be purchased by the American Motors Corp., 141 Broadway, New York City, which is building an addition to its plant in Plainfield, N. J., 60 x 280 feet. One forging furnace, one 13-inch lathe, one 16-inch shaper or crank planer, three or four presses, an automatic wire straightening and cutting machine, a welding machine, and a bench drill, motors, etc., will be purchased by the Kunehelm Mfg. Co., Gardner, Mass., manufacturer of children's vehicles.

Numerous smaller inquiries from the immediate vicinity of Cleveland are before sellers. The Post Tractor Co., Cleveland, is asking for a 2-spindle drilling and tapping machine among other tools. The Ohio Heating & Pipe Bending Co., 1063 West Eleventh street, Cleveland, is in the market for power apparatus, two lathes, etc., having increased its capital to $250,000 in order to erect a new plant. The Automatic Products Co., Cleveland, has been in the market for some equipment and has placed some orders, as has the National Screw Products Co., Detroit. The Wheeling Radiator & Mfg. Co., Cleveland, is understood to have filled its requirements of grinding machinery. The Lang Body Co., Cleveland, is making tentative inquiry for its equipment requirements for its enlarged plant. The Minerva Engine Co., Cleveland, is looking toward its new machine shop requirements. It is expected that some of the requirements of the Springfield Advance Machine Co., Springfield, O., incorporated by H. S. Bradley and others with $50,000, will be placed in Cleveland. When the F. R. Fortune Tool & Mfg. Co., Wooster, O., moves the business of the H. R. Lewis Tool Co., Detroit, which it has purchased, to the former town after the new plant is built, it will doubtless issue a list of machine tool needs.

Increased activity on the part of the railroads is noted. Inquiries are being received from the Pennsylvania lines west, as well as from the New York Central railroad, as referred to last week. Railroads consider that the outlook has improved for remedial legislation which will allow for a return of the railroads to private operation early next year. It is against that time that the railroad purchasing agents now are lining up shop requirements.

Further information about the proposed $50,000,000 steel car plant at Chillicothe, O., is unobtainable. Dealers and manufacturers representatives who went to Columbus, O., to see the engineer, W. H. Monahan Jr., reported to have charge of awarding 35 cranes, returned without being successful in communicating with the latter. Another effort is being made this week.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

BOSTON.—The Massachusetts Electric Dredge Co. has been incorporated with $50,000 capital by Charles E. Fay, Fred C. Fernald and Forrest H. Abbott, Quincy, Mass.

CHARLESTOWN, MASS.—The Crosby Steam Gauge & Valve Co., Boston, contemplates a foundry extension and office addition.

EAST CAMBRIDGE, MASS.—The H. B. Smith Co., Westfield, Mass., heating apparatus, is taking bids for a 1-story, 100 x 200-foot storehouse to cost $50,000.

EAST PROVIDENCE, R. I.—The Standard Oil Co. is having plans made for a 2-story and basement, 42 x 62-foot with a wing 32 x 30-foot laboratory and a 2-story and basement garage to include a 32 x 100-foot boiler room to cost $500,000.

MANSFIELD, MASS.—A large warehouse will be erected here by the Union Warehouse Corp.

MARLBORO, MASS.—The Koehler Mfg. Co. has let a contract for a 2-story, 50 x 250-foot plant.

SPRINGFIELD, MASS.—The Oliver Mfg. & Sales Co. has been incorporated to make a vehicle brake with $100,000 capital, by Oliver Patterson, Abraham Ratner and Max Rabinovitz.

SPRINGFIELD, MASS.—The Russell Electric Co. has been incorporated to make appliances with $10,000 capital, by Matthew Russell, Harold P. Litchfield, Newton, Mass., and Willmot Nash, Wollaston, Mass.

SPRINGFIELD, MASS.—The Eldridge Electric Mfg. Co. has been incorporated to make tools, appliances and hardware specialties, with $25,000 capital, by Arthur C. Wright, Norman B. Ellison, Holyoke, Mass., and R. A. Wright.

WATERTOWN, MASS.—C. M. Leach, Boston, has been awarded a contract to erect a 1-story, 67 x 75-foot building at the United States arsenal.

PAWTUCKET, R. I.—The Collyer Insulated Wire Co. will build a 60 x 110-foot plant addition at an estimated cost of $100,000.

PROVIDENCE, R. I.—The Crompton & Knowles Loom Works will build an addition to its foundry, 83 x 222 feet.

PROVIDENCE, R. I.—The Mueller Metal Co., 288 Dyer street, contemplates a plant, 2-stories, 50 x 100 feet, to cost $33,000.

BRIDGEPORT, CONN.—The Bridgeport Brass Co. has awarded a contract for an addition to its foundry, 120 x 220 feet, to cost $150,000.

RBIDGEPORT, CONN.—The Columbia Graphophone Co. will erect two 6-story and 4-story plants, which will be equipped with machinery for the manufacture of records.

BRIDGEPORT, CONN.—The O. K. Spring & Machine Co., Inc., has been incorporated with $5500 capital by A. F. Brown, Alex Langfelder and Ignatz Czeisler, both of New York.

BRIDGEPORT, CONN.—The Motive Products Corp. has been incorporated to make roller bearings, etc., with $300,000 capital, by Jonathan Grout, Fairfield, Conn., Louis C. Held and L. E. Disbrow.

CAMBRIDGE, MASS.—Bids closed Oct. 29 for a 4-story, 74 x 90-foot addition to the Cambridge Rubber Co.

EAST BERLIN, CONN.—The Connecticut Metal & Chemical Co. has started work on a plant addition, 1-story, 115 x 321 feet.

EAST HARTFORD, CONN.—Property has been purchased by the Atlantic Refining Co. for a new plant.

EAST NORWALK, CONN.—Plans are being drawn for a 5-story, 60 x 300-foot plant addition and a 2-story, 60 x 150-foot power house for the Crofut & Knapp Co.

HARTFORD, CONN.—The Hartford Rubber Works Co. contemplates spending several hundred thousand dollars on plant additions.

HARTFORD, CONN.—The Hartford Electric Welding Co. has been incorporated with $25,000 capital by George F. Smart, Harry A. Wilcox and S. W. Wilcox.

HARTFORD, CONN.—The Hanson-Whitney Mfg. Co. machine tools, has let the contract for a 4-story 60 x 120-foot plant, which with equipment will cost about $100,000.

HOLYOKE, MASS.—The Walsh's Holyoke Steam Boiler Works will build a 1-story erecting shop, at an estimated cost of $10,000.

MERIDEN, CONN.—The Charles Parker Co., maker of guns, screws and hardware, has let the contract for the erection of a 3-story, 50 x 200-foot plant addition.

MILFORD, CONN.—The Milford Machine & Tool Co. has been incorporated with $10,000 capital by

An Open Letter About Wood Block Floors

By P. C. REILLY

President Republic Creosoting Company, Manufacturers of Kreodone Wood Floor Blocks

EVERY man who is going to put a wood block floor in his factory should give most serious consideration to just what a wood block floor must be and what it must do for him.

If he orders "a wood block floor," without *knowing* the ins and outs and the whys and wherefores, he runs a pretty good chance of buying a costly disappointment.

The advantages and economy of wood block floors have been demonstrated and established beyond question, even before creosoted lumber was used.

The early decay and absorption of moisture by untreated blocks was overcome as soon as the antiseptic and sealing properties of creosote oil were established, and we developed the first creosoted wood block floor manufactured, using, then as now, a pure creosote oil as the preservative.

So it went on, step by step, until at last Kreodone Wood Floor Blocks were evolved. These perfect blocks are preserved with a creosote oil so pure and of such a high grade that we call it Kreodone Oil in order to avoid confusion with the general term of "creosote oil," which is indiscriminately applied to creosote oil of almost every grade.

Kreodone Oil is *not* an adulterated creosote oil; that is no tar or petroleum products are added to cheapen its cost and reduce its efficiency. Kreodone is a refined creosote oil; it is a creosote that has the volatile elements removed and only the constant, efficient elements of creosote left.

A wood block floor depends for its life and wear upon two things—the quality of the wood and the quality of the preservative oil used.

Kreodone Wood Floor Blocks are made of long-leaf yellow pine of the finest quality. This wood is given our own special treatment with our own Kreodone Oil. This antiseptic oil stays there permanently. It keeps out moisture; it prevents the action of decay. It increases the wearing resistance of the block.

You will know a Kreodone block by its *light brown* color. Split the block and you will see that this color characterizes the inside as well as the outside.

Now, when a poor grade of creosote oil is used, tar in some quantity is present. Such a block will be very dark, often black. After it is laid, the tar will exude, making the surface of the block sticky. That is annoying, but the real evil is that this poor oil is volatile. It *evaporates*. The tar coloring may remain, but the preservative is gone, and although the block may last for a few years—just as any wooden floor will—decay will eventually set in and the floor must be replaced.

These are important points for you to know. Installing a wood block floor is an investment of some consequence, not so much by reason of the money involved as because of the *service* you can and *should* receive from such a floor.

Our engineers will be glad to go into this matter fully with you. We can show you proof of the superior quality of Kreodone Blocks, and from a technical standpoint we can make it clear to the layman just why he should accept nothing less than Kreodone Wood Floor Blocks.

Write to us, telling us the space you have to cover and we will either send a representative to see you or write you exactly what in our judgment is the best way for you to get the full benefit of Kreodone Floor Blocks.

NEW BRITAIN.—Work has been started by the Stanley Steel Works, on its new plant in this city. The main building will be 300 x 700 feet.

NEW BRITAIN, CONN.—The American Hardware Corp. has awarded a contract for a foundry addition, 2-stories, 62 x 264 feet, to cost $125,000.

NEW BRITAIN, CONN.—The Knebel Mfg. Co. has been incorporated to make steel, brass and other metals, with $50,000 capital by Richard Knebel, Herman G. Markie and William C. Betz.

NEW HAVEN, CONN.—The Wengraf Auto Hoist Co. has been incorporated with $10,000 capital by Jacob Sharpe, Frank Wengraf and S. C. Rosenberg.

NEW HAVEN, CONN.—The New England Iron Works has been incorporated with $250,000 capital by S. Z. Poli, Edward Poli, Abraham Natkin, James A. Natkin, Matthew A. Natkin, Benjamin A. Natkin, Harry L. Brooks and Walter M. Sheehan.

PLANTSVILLE, CONN.—A 50 x 240-foot forge shop will be erected by the Atwater Mfg. Co.

SOUTHINGTON, CONN.—Peck, Stow & Wilcox are progressing rapidly with a new plant addition, and equipment will be installed shortly.

TORRINGTON, CONN.—Plans are being drawn for a 3-story, 60 x 150-foot factory to cost $65,000 for the Torrington Mfg. Co., builder of machinery.

WATERBURY, CONN.—The Waterbury Farrel Foundry & Machine Co. has let a contract for a 72 x 102-foot machine shop and a 1-story hardening room. A foundry building will be erected later.

WORCESTER, MASS.—The Norton Co. has let the contract for a 1-story, 30 x 140-foot warehouse.

North Atlantic States

BROOKLYN, N. Y.—William E. Taylor & Co., Inc., contemplates making elaborate improvements to its plant.

BUFFALO.—The Contractors Ornamental Steel Co. recently was incorporated with $10,000 capital, by H. W. Meyer, J. H. Wilting and W. F. Schuets.

CORTLAND, N. Y.—The Cortland Sweeper Co., street sweepers, plows and harrows, has been incorporated with $25,000 capital, by F. L. Tichenor, G. F. Beaudry and E. W. Smith.

LONG ISLAND CITY, N. Y.—The Connelley Iron Sponge & Governor Co. has purchased a site on which it plans to erect a modern plant.

LONG ISLAND CITY, N. Y.—The Leeds Phonograph Record Co., Record and Review streets, contemplates a boiler house, 1-story, 28 x 49 feet, to cost $5000.

MINEOLA, N. Y.—The Allied Automotive Corp. has been incorporated with $250,000 capital, by J. F. Egan, W. E. Kisselburg and E. E. Gilman, 149 Broadway.

NEW YORK.—The Perth Amboy Dry Dock Co. is having plans drawn for a shipbuilding plant.

NEW YORK.—The Aeolian Co., 29 West Forty-second street, plans a warehouse and a boiler house.

NEW YORK.—The Liberty Auto Ignition Co. has been incorporated with $150,000 capital, by H. Eissenbach, L. Kretzer and L. Baskin, 1121 Tinton avenue.

NEW YORK.—The Geyser Electric Washing Machine Co. has been incorporated with $20,000 capital, by F. H. Butehorn, E. S. Hawley and R. S. Baker, 37 Wall street.

NEW YORK.—The Overland Caterpillar Chain Co. has been incorporated with $500,000 capital, by G. D. Proctor, J. J. Hegan and J. J. Krauss, 1213 Wheeler avenue.

NEW YORK.—Emilio Bracchi, machinery and metals, has been incorporated with $10,000 capital, by E. Bracchi, G. J. Giudici and N. Greenberg, 3 West 112th street.

NEW YORK.—The Vitreous Enameling & Stamping Co. has been incorporated with $300,000 capital, by H. Bruckner, W. J. Flynn and G. P. Morrell, 1632 University avenue.

NEW YORK.—The Utility Products Corp., electrical machinery and devices, has been incorporated with $100,000 capital, by G. Tiernan, 64 Wall street, G. H. Parcell and others.

NEW YORK.—The Gairas Mfg. Co. has been incorporated to make and repair machinery with $25,000 capital, by J. A. Poytras, G. F. Geiszler, and J. A. Lyons, 319 East 159th street.

NEW YORK.—The Utility Products Corp., machinery and electrical supplies, has been incorporated with $100,000 capital, by F. H. Parcell, G. Tiernan and J. B. Parcell, 64 Wall street.

NIAGARA FALLS, N. Y.—The Republic Carbon Co. is taking bids for a large plant addition and a new office building, to cost $175,000.

NORTH TONAWANDA, N. Y.—The Horschell Spillman Co., 102 Sweeney street, has awarded a contract for a motor building addition, 64 x 114 feet.

ROCHESTER, N. Y.—The American Laundry Machinery Co. has had plans drawn for a machine shop addition.

SYRACUSE, N. Y.—The Vulcan Die Casting Corp. recently was incorporated with $150,000 capital, by C. M. Kessler, E. B. Frost and A. L. Wellhoefer.

SYRACUSE, N. Y.—The Whiting-Graser Co. has been incorporated to operate a machine shop with $25,000 capital, by J. T. Whiting, T. T. Graser and E. L. Wildman.

SYRACUSE, N. Y.—The C. W. Leed Mfg. Co. has been incorporated with $100,000 capital to manufacture hardware specialties in addition to a ball-bearing lubricating device.

ALLENTOWN, PA.—George H. Hardner has a permit to erect a machine shop, 75 x 85 feet, for James and Benjamin Eastwood.

CHAMBERSBURG, PA.—The Southwark Foundry & Machine Co., Philadelphia, has leased the plant of the Quincy Engine Co.

LANCASTER, PA.—The Lancaster Foundry Works has been incorporated with $150,000 capital, by Charles E. Long and others.

PHILADELPHIA.—The Pennsylvania Forge Co. has awarded a contract for a forge shop, 100 x 200 feet.

PHILADELPHIA.—Max Haupt has awarded a contract to the Standard Construction Co. for a forge shop addition.

PHILADELPHIA.—Plans are under way for a power house at the Frankford arsenal. The building will be 1-story, 135 x 139 feet.

PHILADELPHIA.—The Philadelphia Dyeing Machine Co. has awarded a contract for a plant, 1-story, 64 x 108 feet, to cost $22,000.

WASHINGTON, PA.—The Washington Molding Foundry & Machine Co. is reported planning a new foundry and cupola.

ELIZABETH, N. J.—The property of Runkel Bros., Inc., adjoining the plant of the Duesenburg Motors Corp., has been purchased by the Willys Corp.

JERSEY CITY, N. J.—The A. R. Burnette Corp. has been incorporated to manufacture tools, etc., by C. A. Cole, R. A. Van Vorhis and A. R. Oakley.

NEWARK, N. J.—A proposed plant costing $10,000 will be expended by the Ellis Motor Car Co. on a new garage 268 x 339 feet.

LINK-BELT
LABOR-SAVING CONVEYORS

THESE illustrations show some of the Link-Belt Assembling Conveyors designed and built by us for the Willys-Overland Company, Toledo, Ohio.

The high increase in production of automobiles by the several prominent American Manufacturers was made possible only by the use of such time-and-labor-saving equipment and today these concerns are practically dependent upon modern and efficient labor-saving conveyors.

Let our experienced engineers look over your methods of production, and find out if there is a better way to handle your products. The present-day scarcity of labor makes it necessary for the progressive manager to select the simplest methods of production. Link-Belt Conveyors can be found today in some of the smallest as well as the very largest plants in the country. Write today.

New Trade Publications

AIR HOISTS.—The Northern Engineering Works, Detroit, has published catalog No. 35, in which it describes and illustrates several types of vertical and horizontal air hoists. One type is equipped with a double beam socket bearing trolley, for use on cranes where head room is limited. Air jacks and air operated elevators are also described and illustrated in the booklet.

STRUCTURAL STEEL.—A 24-page illustrated booklet has been issued by the Truscon Steel Co., Youngstown, O., in which the use of structural pressed steel for floors, roofs, walls, partitions, etc., is described and illustrated. A number of the illustrations are of buildings in the process of construction, showing how pressed steel beams and reinforced concrete beams are used.

TURBINE BLADING.—A thorough description, accompanied by numerous illustrations, of steam turbine blading, is given in a 26-page booklet recently published by the Allis-Chalmers Mfg. Co., Milwaukee. The various methods of manufacture are described at length. The booklet contains a description of the manner in which the modern steam turbine attained its present status in industry. The booklet is interesting and contains much valuable information.

FORGINGS.—An 18-page booklet is being circulated by the Allis-Chalmers Mfg. Co., Milwaukee, which contains a number of illustrations showing the various equipment in the forging department of that company. The heating an annealing equipment is oil fired and equipped, and the plant is modernly equipped with chemical and physical laboratories. The illustrations indicate the wide range of work done in the plant.

ELECTRIC HOISTS.—The Northern Engineering Works, Detroit, has published a 16-page booklet in which electric hoists are described and illustrated. In these hoists, the gearing is of forged steel, annealed. Gears are enclosed. All hoists are equipped with two brakes and a limit stop automatically stops the hook at the top of the lift. The bearings are of phosphor bronze and are automatically lubricated. Other data and numerous illustrations are given.

OIL-BURNING EQUIPMENT.—The General Combustion Co., Chicago, has issued three bulletins, Nos. 52, 53 and 54, in which oil burning equipment is described and illustrated. Bulletin 52 gives general data pertaining to the equipment. It contains a number of illustrations. A rivet forge, 16 x 21 inches and weighing 180 pounds, is described and illustrated in bulletin 53. Continuous forge furnaces are described in detail in bulletin 54. This bulletin contains a number of excellent illustrations including several line drawings.

GRAPHIC RECORDS.—A circular entitled "Typical Graphic Records," is being distributed by the Esterline Co., Indianapolis, in which curves showing the power consumption of machines are reproduced and explained. The booklet points out the valuable use of records in comparing the amount of power used by various machines, and which results in the detection of faulty practice. A number of records were described in the Oct. 23 issue of THE IRON TRADE REVIEW. The booklet also contains a number of charts which show the power consumed in the operation of furnaces, shears, electric elevators, etc.

FANS.—A unique booklet entitled "A Dance, A Fan and The Girl," has been issued by the Clarage Fan Co., Kalamazoo, Mich. This booklet is a novel departure from the usual trade literature. It contains a story of how an assistant foundry superintendent had to call off an engagement when a fan at the foundry got out of order. Years later the incident is called to his mind when the purchasing agent of the plant of which he is general manager, buys a fan which can be fixed in a fraction of the time it took him to repair the fan years before. The story is interesting and various points of the fans manufactured by the Clarage Co. are brought out in a pleasing way.

FLEXIBLE SHAFTING.—Bulletin No. 104 issued by the Stow Mfg. Co., Inc., Binghampton, N. Y., describes and illustrates flexible shafting. This shafting consists of an inner core constructed of built-up wire coils and a protecting casting with bearings and suitable fittings, for the transmission of power from some source such as an electric motor, countershafting or engine, to the desired tool. The core is brazed or soldered into end fittings, asembled into a reinforced leather or metal casing, which supports the bearings, and is held in the case in such a way that when the shaft is bent no strain will come on the core longitudinally. Various data pertaining to this shafting is given, as well as a number of illustrations showing its use with various tools and in various operation.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

A company in India desires to purchase iron and steel goods, hardware, heavy industrial chemicals, etc. Opportunity No. 30880.

A firm in Spain desires to purchase machinery for mixing, kneading and stamping names on biscuits. Opportunity No. 30924.

A newspaper in France desires to purchase labor-saving machinery, particularly rapid rotary presses, flat-bed presses, punching machines, wire-stitching machines, cutters and folding, mailing, molding, typesetting and autoplate machines, etc. Correspondence should be in French. Opportunity No. 30931.

An engineer in Italy desires to secure an agency for the sale of mechanical and electrical goods. Opportunity No. 30932.

A list of inquiries for American merchandise, such as oil refining machinery, metal goods, chemicals, surgical apparatus, rubber goods, etc., has been received from the American consul at Valencia, Spain. Firms interested in this trade may secure copies of these lists upon application to the bureau or its district offices. Opportunity No. 30944.

A list of inquiries for American merchandise, such as oil refining machinery, metal goods, chemicals, etc., have been received from the American consul at Valencia, Spain. Firms interested in this trade may secure copies of these lists upon application to the bureau. Opportunity No. 30944.

A business man in North Africa desires an agency for the sale of steel products, such as steel bars, galvanized sheet iron, annealed steel wire, etc. Opportunity No. 30949.

A business man in North Africa desires an agency for the sale of steel products, such as steel bars, galvanized sheet iron, annealed steel wire, etc. Opportunity No. 30949.

A Russian civil engineer desires to represent in Latvia American manufacturers of automobiles, typewriters, elevators, engineering supplies, concrete machines, machine tools, etc. Opportunity No. 30964.

The purchase of motors, 3-phase, 40 cycles, 220 volts, controllers, starters, transmission equipment, railroad equipment, centrifugal pumps, steel cables steel balls, office equipment, etc., is desired by a manufacturing company in Belgium. Opportunity No 30966.

A firm in Spain desires to be placed in touch with manufacturers and exporters of metals, timber, chemicals, etc. Opportunity No. 30967.

An American firm is authorized by its main office in China to purchase complete machinery and equipment for the refining of crude camphor. Opportunity No. 30974.

A Frenchman, who has been in this country for some time and is about to return to France, desires to secure an agency for the sale in that country and in Belgium, of textile machinery, etc. Opportunity No. 30978.

Laundry machinery, including washing machines of alternating movement, dryers, pressers, etc., are needed by a firm in France. Correspondence should be in French. Opportunity No. 30980.

A Swiss wholesale merchant of steel and metal products desires to enter into direct business relations with steel works, copper and brass smelting houses, and wire-drawing concerns, as well as firms which can supply dynamo sheet iron, transformer sheet iron and motor sheet iron. Opportunity No. 30983.

An agency is desired by a firm in Spain for the sale of wrought-iron tubes and metallic fittings. Opportunity No. 30984.

A representative of an Australian house importing machinery, now in this country, desires agencies for the sale of windmills, small refrigerating machinery, motor trucks, oil and gasoline engines and lighting plants. Opportunity No. 30985.

A man in Australia desires to be placed in communication with manufacturers of canning machinery. Opportunity No. 30988.

An agency is desired by a man in South Africa for the sale of small suction gas engines, iron piping, barbed wire, iron standards, etc. Opportunity No. 30989.

An agency is desired by a firm in Italy for the sale of heavy motor trucks, motor cranes, agricultural machinery, etc. Correspondence should be in Italian. Opportunity No. 30990.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, November 6, 1919 No. 19

Coal Strike Has Slight Effect

Iron and Steel Producers Comfortably Supplied For Limited Period—Connellsville Region Operating at Increased Rate—Pig Iron Production Being Restored With 54 Stacks Gained in October—Prices Still Advancing Steadily

IRON and steel production as yet has escaped any appreciable effects from the coal strike. A prolongation of the present curtailment of the country's basic fuel output, however, is bound to be expressed in operating difficulties on an ascending scale. The Connellsville coal and coke region, the key point of supply for a large fraction of the blast furnaces of the country is nonunion and production this week is greater than usual. A number of idle ovens in fact has been lighted. Should the government decide to commandeer coal from this district for the railroads, this situation is likely to be considerably complicated. By-product coke plants scattered throughout the industry are reasonably well stocked with coal, sufficient in most cases for a month or more of operations. As a contributing factor to the steel strike now in its last stage, the walkout of the coal miners at this time at least, promises to be slight.

Loss of production recently sustained by the mills and furnaces, however, continues to exert a pronounced market influence. Early supplies of finished steel are almost unobtainable and premium prices are general. The Steel corporation continues to name former prices for shipment at mill convenience and some of the independent companies are doing likewise but on definite orders the prevailing tendency is to ask higher figures. Nuts, bolts and rivets have been advanced and bar iron is up $5 a ton at Pittsburgh. A large maker of wrought iron pipe has raised his schedule $8 to $10 a ton. Warehouses are almost bare of sheets and bars and jobbers are advancing these products. Semifinished material has been definitely established $2 to $5 higher by settlements on round tonnages under term contracts at $40.50 on large billets, $44 on small billets, $43 on slabs and $45 on sheet bars.

Famine in Spot Iron

Something approaching a famine condition obtains in pig iron for spot delivery. Buyers are willing to pay almost any price asked for the exceedingly scant supply available, and small sales at fancy figures are being made in various districts. Buffalo No. 2X has been sold up to $35.25. Pig iron prices continue to advance all along the line for deliveries through the first half. A western Pennsylvania interest has converted into open-price contracts 100,000 tons of tentative orders for foundry iron for first half. The 1920 demand for iron is heavy. A leading inquiry calls for 15,000 to 20,000 tons of foundry and malleable grades for the General Motors Corp.

Iron Output Recovering

Pig iron production is coming back rapidly after having been severely reduced by the strike through the banking of many stacks. The number of furnaces in blast on Oct. 31 was 217 against 163 on Sept. 30. Of the 54 stacks gained, 41 were steelworks units. October's output incorporates the main loss sustained from the strike, this amounting to 502,272 tons over September and 763,863 tons over August. October production was 1,978,218 tons against 2,480,790 tons in September and 2,742,081 tons in August.

Coke prices have received the natural impetus from the coal strike. Spot furnace fuel is selling at $5.50 and spot foundry coke at $7.00, Connellsville, with considerably higher done in instances. Two 1920 furnace coke contracts have been negotiated at $5.50 and $5.60, Connellsville.

Lake Superior ore shipments for the season are now closely defined around 48,000,000 tons against 62,836,082 tons in 1918. Ore interests figure that because of the interrupted pig iron production, there will be several million tons more of ore on docks or in furnace yards May 1, 1920, than May 1, 1919.

Railroads in the Market

As the expected restoration of private control draws nearer, railroad buying is becoming more prominent. Rails especially are active. The Pennsylvania lines east are asking for 200,000 tons with the proviso that the orders are cancellable should government operation continue. Uncertainty over this latter point makes the mills reluctant to close contracts and 100,000 tons remain pending at Chicago. The railroad administration has placed with the Bethlehem Steel Corp. 41,000 tons for eastern roads as part of the 200,000 tons on which bids were taken several months ago.

Public Sentiment Takes a Hand

IF FURTHER demonstration were necessary to reveal to the country at large the dominating note of class before mass which has seized upon the leadership of organized labor in this country with almost a frenzy that proof has been abundantly supplied by the coal strike now in progress. Absolute disregard for the rights of and their obligations toward the general public has been shown by those in authority in the coal strike and in a way that has menaced the comfort, wellbeing and even the lives of the everyday citizen. And for what? For the exaction of a set of demands which to the average man seem so extreme and preposterous that they border almost on industrial insanity. To those familiar with the special and difficult conditions which surround the labor of mining coal and the possible rate of production where effort is honestly applied, a reduced basic work-week might have some justice, were it not for the suspicion that it constitutes simply a maneuvering point for higher wages. Too often union labor has made claims of humanity and health in behalf of a lower basic day, only to have them turn out to be mere pretexts for the gouging of an increase of pay. It is pretty difficult for the general public to accept a 30-hour week as a reasonable proposition under any circumstances when it contrasts its own individual conditions and hours of employment. Especially is this so when the familiar and crying need of the hour of increased rather than restricted production is brought to mind. But when it comes to a 60 per cent increase in wages demanded by the union, there can be no division of opinion among sane and sensible people. Added to this, the clear fact that the union is attempting on a purely technical question where the weight of reason is against it, to evade its contract entered into under government auspices, and the insulting not to say unamerican demeanor of its leaders toward the President and governmental authority, there could be no doubt as to the side where the overwhelming opinion of the public rests. Without being necessarily pro-operator it is vigorously and determinedly anti-union.

The coal strike represents in a way more direct and more easily discernible to the average individual, the same effort at union dictation and the same vicious thrust at democracy and equality in this country that has been involved in the steel strike. Both are aimed at the advancement of class against the dictates of all logic, reason and fair play and as such are a menace to fundamental government. The steel strike has been lost because of its radical leadership. The same outcome must result in the coal strike because public sentiment, the determining factor, has grasped the dangerous character of these disputes.

In the present unhappy and disturbed condition of the country with two major strikes in progress and threats of a third filling the air, the hopeful and encouraging thing is the militant display of Americansim at Washington. Congress especially by its attitude in recent weeks has shorn itself of any suspicion of undue consideration for the demands of organized labor, based on political expediency which have marked many of its actions in the past. Much the same thing might be said of the executive arm of the government. But congress now is giving the country a wholesome demonstration of character, of patriotism and of clear-sighted appreciation of the dangerous currents that traverse the national life. And its inspiration for this is to be found in the strong and definite crystallization of public opinion. Out of this situation it is not too much to hope that positive and definite legislation governing the intemperat and destructive acts of organized labor of which the country long has been in need, will emerge.

Expect New Data on Open Hearth

ALL PERSONS who are familiar with the information on the construction and operation of blast furnaces contributed to iron and steel literature during the past decade thoroughly ap-

preciate the importance of the papers dealing with that subject presented at the various meetings of the American Iron & Steel institute. Among the notable papers published during the past four years are those written by A. E. Maccoun, Ambrose N. Diehl, Arthur J. Boynton, George W. Vreeland, Walker Mathesius, James E. West and Jacob A. Mohr. These authors contributed valuable data on recent progress made in the design and operation of blast furnaces, modern methods of burning blast furnace gas, progress in hot blast stove design, distributing raw materials in the blast furnace, chemical reaction of iron smelting and recent changes in blast furnace lines. These papers collectively form what is certainly the most comprehensive and probably the most valuable treatise ever written on the subject of the modern blast furnace.

In view of the success attending the series of blast furnace papers, the announcement that the American Iron & Steel institute will inaugurate a series of papers dealing with the design, construction and operation of open-hearth furnaces will be greeted with the hearty approval of all who are interested in that subject. Dr. Henry M. Howe, in the first paper of the series, has ably set forth an outline of the problems confronting engineers in further developing the open-hearth. The outline, which appears elsewhere in this issue indicates the probable trend toward improvement in the construction and operation of open-hearth furnaces. Judging from the past performances of engineers, executives and metallurgists associated with the American iron and steel industry, we may be sure that a number of notable contributions to the literature on open-hearth practice may be expected which will serve their purpose in promoting an advanced scientific standard for the American steel industry.

Clean Out the Scum

ORGANIZED labor, casting aside all semblance of conservatism, has turned radical and is doing its best to abet and strengthen the hands of those who desire to bring about a social and industrial revolution in the United States. Its autocratic demands know no bounds. This attitude has been sharply manifested in the steel strike. It has been greatly emphasized in the coal strike.

But with the government taking more drastic steps, at least firmer steps than it has been wont to take during the past few years, confidence is felt that organized labor is riding for a severe fall, probably the worst in its career. Perhaps it may be a fatal fall. That can be determined only by organized labor itself, which, if it regains sanity may proceed as an important factor in industrial life. Or it may be determined by the government, if it compels organized labor to recognize authority and the rule of the majority.

But even after organized labor either voluntarily comes back within the law, or is compelled to do so, there still will remain the disturbing agitators, including the so-called reds. Some of this renegade crew are native born—not many, fortunately. Laws exist to take care of these and they should be enforced to the limit. This leaves the foreign disturbers to be dealt with. They include a heterogeneous and vicious group. They must be rounded up and deported.

Attorney General Palmer has asked for the enactment of a law to deport interned alien enemies providing for the permanent exclusion of anarchists and it is about to be passed by congress. The request of the attorney general should be heeded quickly. And the passage of this law should be followed by similar action on the bill of Senator Sterling to imprison and then deport all aliens who in any way advocate sedition. Apparently laws now on the statute books do not cover such cases.

With the country rid of undesirables, much progress can be made toward restoring sane conditions.

Germany Trades Without Money

THE demoralized state of the German mark in the exchanges of the world is compelling that nation to resort to various resourceful strategems in order to obtain urgently required necessities of life from other countries without, at the same time, paying the enormous premiums which cash money dealings would entail. Among the most successful of these plans is a reversion to the primeval method of "barter and exchange" of commodities. Another is what might be termed "percentage manufacturing."

Business interests in England, Holland and other countries are sending raw material to Germany to be manufactured by German factories. For example, Germany is devoid of raw hides for making shoes and an order for hides is placed in a country where there is a supply. German tanneries will finish the stock and German shoe manufacturers will make shoes. Then the shoes are sent back to the country supplying the hides with a certain amount deducted.

By the return to primitive trading methods Germany is enabled to sell its products and to purchase those of which it is in the most need without the exchange of a cent of money.

Germany thus is able to put to effective use her large manufacturing capacity without a comparable outlay of working capital. An arrangement by France with Germany to convert some of the former's excessive supply of iron ore would not be a surprising outcome of the present trade relations which the allied nations are resuming with their erstwhile enemy.

Iron and Steel Prices

Pig Iron Prices Still Advancing

Virtually Famine Condition Exists In Spot Iron And Buyers Pay Large Premiums Without Hesitation—Western Pennsylvania Producer Books 100,000 Tons of Foundry Iron—General Metals Corp. Wants 15,000 to 20,000 Tons

Pittsburgh, Nov. 4.—Although the prices have not yet been made, merchant furnace interests with three stacks operating in western Pennsylvania recently have converted into contracts inquiry involving more than 100,000 tons of foundry pig iron for shipment over the first half of 1920. This producer now has comparatively little free iron for first half. Generally those who have any foundry iron for shipment between now and Jan. 1, are quoting a basis of $30 furnace for No. 2 (1.75 to 2.25 silicon). Single carloads have been done at this price and in some instances more. No dimunation is noted in the demand for malleable of which 2000 tons recently were sold for this year at $30 valley furnace, and on 1000 tons for first quarter delivery, close to $31 furnace is said to have been obtained. Nothing recently had been done in gray forge but it is held at a higher price in keeping in advance of foundry grade, now being rated normally at $29 furnace. Purchases of 500 tons of southern foundry iron running 2.25 to 2.75 silicon is noted by the Standard Sanitary Mfg. Co. for its Louisville, Ky. plant. This iron was sold at $29 furnace for No. 2 grade, plus 4 per cent for the half point higher silicon, or $30.16. This now is the method of quoting employed by southern furnaces. An unverified report is that 2000 tons of basic iron recently was sold for prompt shipment of $28 by a valley furnace interest but makers of this grade generally report inquiries few and small, and actual sales higher than the old nominal base of $25.75 furnace are lacking. The N. & G. Taylor Co., Cumberland, Md., recently put out an inquiry for 3600 tons of basic for first quarter 1920 delivery, but as yet this inquiry has brought few quotations. A sale of 500 tons of standard bessemer is noted at $28.95 furnace for prompt shipment to an eastern consumer, or $1 ton advance over recent prices. Most sales of this grade, however, have been in lots of 150 to 200 tons and carry the old quotation of $27.95 furnace. W. T. Snyder & Co. report the average sales prices of valley iron for Octo-

Scarcity Leads to Higher Prices

New York, Nov. 4.—In view of the scarcity the continued demand for pig iron in the east continues to push up prices. Eastern Pennsylvania foundry iron for this year, which is almost impossible to obtain, has been sold during the past week at $33, furnace, for 2.25 to 2.75 silicon, and this is the present minimum. Central Pennsylvania foundry of this grade has been sold during the week at $35, furnace, for November shipment. Foundry iron containing 1.75 to 2.25 silicon also is scarce but not as much so as 2.25 to 2.75 silicon, and the former grade still may be quoted at $31 to $32, eastern Pennsylvania furnace. Some Virginia foundry, containing 1.75 to 2.25 silicon, continues obtainable for the next 30 to 60 days, at $31 furnace. Very little Virginia 2.25 to 2.75 silicon is to be had, so that the market on this grade is nominal at $32. The price view of a leading Virginia interest, which, however, is out of the market at this time, is $34.25 for this grade. Virginia high silicon iron is commanding big premiums. Some foundry iron containing around 4 per cent silicon, has brought $38, furnace.

There is more inquiry for low phosphorus iron. One sale of 1500 tons of copper-bearing iron has been made at $36, furnace, and higher prices in some cases are being quoted. Inquiry for malleable iron is active. Some off-malleable has been sold at $30, eastern Pennsylvania furnace, but no standard malleable is to be had. About 1000 tons of low phosphorus basic have been sold in this district at around $28.25, about $1.25 higher than the figure at which standard basic recently has been selling.

Famine Prices Prevail

Cleveland, Nov. 4.—A famine condition in spot pig iron continues and buyers are paying practically any price that is asked. Southern Ohio, 1.75 to 2.25 silicon, iron for quick shipment in small lots and off in sulphur has been sold at $32 furnace or $34.40, Cleveland. A small lot of 2.25 to 2.75 silicon Pensylvania iron for December delivery was placed locally at $33 furnace or $36.30 delivered. Buyers are going far out of their geographical zone to obtain iron as is shown by sales of approximately 1500 tons of malleable to Michigan point at $29, valley furnace, and a small lot of off-basic for eastern shipment at $26 northern Ohio furnace. Cleveland malleable for next year has been sold at $30, furace, and 1.75 to 2.75 foundry iron now is held on that basis. Sellers in this district have a heavy inquiry for next year but only a small part of this is for the Cleveland district. Some of the motor car builders are figuring on heavy tonnages, the most important of which is 15,000 to 20,000 tons of foundry and malleable for first half for the General Motors Co. One interest which is not quoting at present now has accumulated about 50,000 tons of inquiry from its regular customers and is expected to name its

price for next year soon. The Westinghouse Electric & Mfg. Co. which has had an indefinite inquiry for its local plant of next year has done nothing with this. Local production is increasing but only a limited amount of merchant iron is being shipped since most of the output is for connected steel works use. The car situation is less troublesome than a week ago. Some southern Ohio makers of silveries now are quoting $45.25 for 8 per cent.

Foundry Inquiry Falls Off

Cincinnati, Nov. 4.—Inquiry for first half foundry iron has fallen off. This is considered natural after a heavy buying movement of the past two weeks. The first part of last week a considerable tonnage of both northern and southern iron was taken by local and nearby melters. As a result the majority of producers in southern Ohio and the South have withdrawn from the market, or have made sharp advances. It is understood that the bulk of the 1.75 to 2.25 silicon iron bought recently went at $29 to $29.50, Birmingham, and at $29 to $29.75, Ironton. Prompt shipment quotations in both districts are hard to obtain as melters have been willing to pay premiums to obtain spot metal. The South seems to be fairly well cleaned up as far as this year is concerned, with the exception of some off iron or odd lots of high silicon.

Good Demand at St. Louis

St. Louis, Nov. 1.—Demand for pig iron is urgent, and selling agencies report the most general and brisk inquiry for foundry grades noted since the armistice. In the aggregate large tonnages have been disposed of during the past week or 10 days, individual sales ranging from 200 to 1000 tons. Most of the transactions have been for prompt shipment, though fair tonnages have been sold in the South for delivery through the first quarter. A number of the latter sales were made at an advance of $1 over this year's figure. A feature of the most recent business has been the large number of sales to the North, including Iowa and Nebraska. One melter has placed an order for 1200 tons of No. 2 foundry (1.75 to 2.25 silicon), with the local agent of a leading Birmingham furnace interest.

Coal Situation Stimulates Sales

Boston, Nov. 3.—Not until the eve of the coal strike did New England pig iron consumers awake to the far reaching possibilities of any prolonged shortage of coal. Then however there was a scramble after any iron offered and prices were almost overlooked in the excitement. Iron which advanced $3 in one day was sold without difficulty and the meager supplies available were rapidly depleted until the first of this week finds scarcely a pound of 2X Northern iron for 1920 delivery to be had anywhere for shipment to New England. The Sullivan Machinery Co., Claremont, N. H., is asking for 300 tons of 3.25 to 3.75 silicon iron for delivery over the first quarter and so far has received no offers whatever. An urgent demand for spot malleable has found no reply even though the inquiry was sent as far west as Cleveland and other points west.

This unusual demand has caused some iron to come into the market for resale and prices of $39 and $40 delivered have been asked. Eastern Pennsylvania iron has been sold at $33 at the furnace for 2X eastern (2.25 to 2.75 silicon) for spot shipment.

In the Virginia field low silicon iron and special manganese iron is available and sales have been comparatively heavy. Spot iron of 1.75 silicon has sold for $36 delivered. One textile machinery foundry which has previously bought up to the end of the first half is now inquiring for 1000 tons for first quarter. The sales among local dealers have been light because of the absence of iron.

Buffalo Prices Advancing

Buffalo, Nov. 4.—Scarcity of iron in this district is driving the prices steadily upward. Three producers are out of the market, one by reason of the strike, while the fourth is booking very little iron, and that at an advance in price. This interest is selling iron at the following prices: No. 2 foundry (1.75 to 2.25 silicon) $34; No. 2X (2.25 to 2.75 silicon) $35.25; No. 1X (2.75 to 3.25 silicon) $37. A considerable tonnage for prompt delivery was sold at these figures. Another maker which may have some prompt shipment iron in a limited quantity before the first of the year, states that the price will not be less than $35 for 1X grade. That these prices will not prevail for the first half is partially indicated by the fact that one interest announces that when it goes into the market for first half iron, which may be within two weeks, its schedule will be $31 for No. 2; $34 for 1X and $32.25 for 2X. Malleable iron is scarce and offers of $32 to $34 have failed to bring any out. It is estimated that the total amount of inquiry in this district for the past week has been close to 50,000 tons.

Iron for 1920 Selling Readily

Birmingham, Ala., Nov. 4.—Southern furnaces which are still in the market are having no difficulty in selling iron for 1920. Three companies continue out of the market, waiting to see what effect the coal miners strike will have. Quotations are around $28 for spot, No. 2 foundry (1.75 to 2.25 silicon), while the same grade of iron for first quarter delivery is quoted at $29. Banking of fires in the Vanderbilt furnaces of the Woodward Iron Co. will not affect the output materially. Inquiries for iron are being received in this district from sections where the steel strike effects have been more serious.

Advance is General

Chicago, Nov. 4.—Higher prices for pig iron are being asked by practically all producers, especially for 1920 delivery, and most makers find their output for first half going so fast they must use every effort to limit selling to absolute necessities. As a result buying is becoming increasingly difficult. Severe loss of production during the steel strike and the present menace of the coal strike conspired to make the situation uncertain and to limite free selling. Local producers are almost out of the market until the situation clears. Iron is being received from other producing centers, but at advanced figures. Sloss iron has been advanced to $30, Birmingham, for 1.75 to 2.25 silicon with 4 per cent added for each 50 points of silicon. This company formerly was selling prompt iron at $28, Birmingham. Woodward is out of the market. Prompt iron on cars is sold as soon as offered. A Wisconsin melter recently took 1500 tons of malleable at $31, valley furnace. The American Radiator Co. bought some iron recently and is now seeking 2000 tons for this year. The Crane Co., Chicago, is inquiring for about 500 tons for last quarter. A northern Illinois user desires 1500 tons of foundry iron for first quarter and several Michigan melters are inquiring for about 2000 tons each of foundry for first half. High phosphorus iron is in demand to mix with northern iron deficient in that element. All producers of silveries are practically out of the market and this grade is almost impossible to obtain at present. A Tennessee stack which has been selling for 1919 delivery has not yet opened its books for 1920. Lake Superior charcoal iron is not being quoted openly in this market, but quotations furnished on specific inquiries range from $33 to $35, furnace, for 1.50 silicon.

Prices Rising Steadily

Philadelphia, Nov. 4.—While pig iron demand is not large in this district it is insistent and the effect of the scarcity is to put up prices steadily. Eastern Pennsylvania No. 2X (2.25 to 2.75 silicon) $33 is the ruling price and $34 is asked. Eastern Pennsylvania No. 2 plain (1.75 to 2.25 silicon) has been sold at $32 furnace and this now is minimum. Central Pennsylvania No. 2X has been sold at $33.50 furnace. No. 1X (2.75 to 3.25 silicon) is $1 to $1.50 higher than No. 2X. Buffalo iron is selling at $32.25 furnace for No. 2X for November-December-January, with No. 2 plain at $31 and No. 1X at $34. Virginia No. 2 plain is selling at $31 furnace, No. 2X at $32.25 and No. 1X at $34. One Virginia furnace has asked $37 on No. 1X for next year. There is little disposition to sell for next year and this is being done only in exceptional instances. Malleable is exceedingly difficult to get and one eastern consumer bought a round tonnage at $32.25, Ohio furnace, plus $5.10 freight and some iron was sold in New York state at the same Ohio furnace price. In this case, however, a certain analysis was wanted and the price done does not represent eastern malleable market. Although no basic was sold in the past week it is said that considerably higher than the last price of $28 delivered now would have to be paid. The N. G. Taylor Co., Cumberland, Md., is inquiring for 3600 tons of basic for next year. About 3000 tons of standard low phosphorus iron was sold at $38 eastern furnace and 2500 tons of copper-bearing at $35 furnace. A round tonnage of gray forge was sold at $31.50 delivered eastern Pennsylvania. The coal strike has not had time to affect furnace operations. It is estimated that if coke shipments were com-

pletely cut off, it would take about a week for most eastern furnaces to go out of blast.

Ore Supplies

Will Be Plentiful at Furnaces During Rest of the Year

Cleveland, Nov. 4.—As the season for shipping ore from the Lake Superior district draws to a close it becomes apparent that furnaces will have a plentiful supply of ore for operations during the remainder of 1919, and that they will have available on May 1, 1920, fully as much, if not more than they had on the same day this year. Difficulties encountered in shipping ore from the Lake Superior district during the past season have been offset by the strike in the iron and steel industry which has served to reduce consumption.

On May 1, 1919, the tonnage on docks at lower lake ports amounted to 5,686,000, and furnaces had a balance of 15,000,000 tons in stock, the total tonnage of Lake Superior ores available on that date amounting to 20,686,000. This season's shipments will amount to about 48,000,000 tons.

The total production of pig iron in the United States from May 1 up to Nov. 1 was 19,847,058 tons, and in this comparison allowance is made for a total make of 28,000,000 up to May 1, 1920.

Of this total approximately 85 per cent will have been made with ores from the Lake Superior district, and on a basis of 1.85 tons of ore for a ton of pig iron, consumption of Lake Superior ore will amount to 44,050,000 tons. This deducted from the total amount of ore available for the period indicates a balance of 24,650,000 tons available May 1, 1920. An element of uncertainty in the calculation is the output of pig iron before May 1, 1920. With a return of normal labor conditions production may proceed apace, but making allowances for good output, there still would be available at least 20,000,000 tons. The United States Steel Corp.'s shipments up to Oct. 1 last year were 42 per cent of the total, and this year 47, so the comparison applies with nearly equal significance to both the corporation and independents.

The car shortage is not deterring shipments to furnaces at present so much as the shortage of labor to unload cars at the furnaces. In a number of instances loaded cars have been returned to the shippers. Despite this situation, however, a leading interest estimates that its deferred shipments to furnaces, due to the strike, amount to but between 2.50 and 3 per cent of the season's business.

There is an entire absence of the usual fall buying movement, and a large number of boats are being taken out of the ore trade.

Shipments of ore in October amounted to 6,201,883 tons, which was 2,339,710 tons less than shipments in October, 1918. Combined shipments for the season up to Nov. 1 were 43,978,414, a decrease of 12,892,457 from the shipments up to the same day last year.

Contract for 1920 Coke

Two Large Lots Placed Around $5.50 and $5.60—Spot Furnace Grades Quotable at $5.25—Market Unsettled

Pittsburgh, Nov. 4.—At least two good sized contracts for first half of 1920 foundry coke have been concluded in the past few days. One of these is for 10,000 tons a month and was placed by an Ohio maker of silvery iron of $5.60, ovens. The other contract is to run for the entire year beginning Jan. 1 and for the first six months carries a price of around $5.50. The buyer is a valley interest operating a furnace, which at this time is a merchant producer. Several other contracts are understood to be under negotiation but there seems to be no particular anxiety on the part of either producers or consumers to close the business. As nearly as can be determined from the business that has been placed for first half, the contract market is quotable from $5.50 to $5.75, ovens. The higher quotation, however, is more of an asking than a selling price, as consumers generally believe that they will be able to cover at $5.50. Some coke oven operators are not much inclined to book for 1920 until the coal strike is ended and they have a better line on costs. Although most spot sales of furnace coke still are reported as high as $6, ovens, and among the sales at this figure was one involving 2000 cars for immediate shipment to a Pittsburgh district steel company, the market is not quotable at higher than $5.25 to $5.50 on direct business to regular consumers. As a matter of fact, brokers have been covering most of such inquiries as they have had recently at around $5.25. Sales above $5.50 represent an emergency demand and are hardly typical. The whole coke situation is somewhat beclouded at the moment by the coal strike and opinion as to the immediate course of the market is somewhat divided. On the one hand, it is figured that the price of $5 a ton or better for coke, with unregulated shipment, is much more profitable than $2.35 for mine-run coal, which price has been re-established as a maximum by the fuel administration. Already, it is stated, a number of ovens have been lighted preparatory to going in for coke production. Sales of spot foundry coke still are heard of as high as $7.50 and $8, ovens, but this is about $1 above what the largest producers are quoting on demand from their regular customers. The production of coke in the Connellsville region for the week ended Oct. 25 is estimated by *The Connellsville Courier* to have been 203,130 tons as compared with 204,445 tons the previous week.

$10.90 to Govern Sales

Boston, Nov. 3.—The foundry coke market has followed coal and pig iron in the general scramble during the last few days. The Everett, Mass., by-product producer has announced a price of $10.90 to govern November sales under the sliding contract schedule. This price is also in effect for the flat rate contracts covering balance of the year but higher prices for spot delivery are expected almost any day. Sales have been exceptionally heavy, one dealer alone reporting 12,000 tons of new business.

Strike Scare Forces Buying

New York, Nov. 1.—Foundries in this district, alarmed by the coal strike threat, have been heavy buyers of quick shipment coke during the past week. Thousands of tons of beehive foundry fuel have been sold for spot delivery at $6.50, $6.75, and in some cases, $7 Connellsville, for standard brands. Large tonnages of by-product foundry coke also have been sold. On this fuel, the northern New Jersey by-product producer, continues to quote $6, Connellsville, or $9.10 delivered at Newark and other northern New Jersey points for shipment this year, but it is likely that this price will be adjusted shortly to accord with the present Connellsville market. In addition to the spot business, there also has been considerable first half buying. For this period, the northern New Jersey by-product maker is selling at $6.50, Connellsville, and there also has been considerable beehive foundry coke sold for first half at this price.

Export business continues a factor. Two lots of foundry coke aggregating 5000 tons, were sold to South American buyers during the week at about the regular market. Both lots were sold by the northern New Jersey by-product maker.

Spot furnace coke was sold in the east during the past few days at $6.50, Connellsville.

Coke Growing Scarcer

Cincinnati, Nov. 3.—Much pressure is being brought to bear on producers to rush forward shipments of both furnace and foundry coke. While foundries are slowly accumulating supplies they are not yet sufficiently large. In the Connellsville district foundry coke is around $6.50 to $7, and operators are somewhat slow in accepting future business at even the higher figure. Wise county foundry coke is scarcer, although occasional odd lots may be had for this year's shipment. The price ranges from $8 to $9, ovens. New River foundry is also scarce and is bringing from $9 to $10, ovens. Practically none can be had for either prompt or forward shipment.

Scramble for Fuel at St. Louis

St. Louis, Nov. 1.—Demand for foundry coke is urgent, and there is a scramble for every available car. Prices are advancing, 72 hour Connellsville being quoted at $6.75 to $7, and it would be easy to sell heavy tonnages at the latter figure if deliveries could be guaranteed. Furnace grades are needed in the St. Louis district and in the West and Southwest.

Cast Scrap Is Bid Up

Scarcity of Pig Iron Causes Strong Demand For Cupola Material—Steel Tonnage Taken In East—Market Firmer

FOR COMPLETE SCRAP PRICES SEE PAGE 1298

Pittsburgh, Nov. 4.—A large and insistent demand still is observed here for No. 1 cupola cast and prices have been further advanced. Sale of 500 tons of this grade is noted at $28, delivered, and it is doubtful if any tonnages could be bought for less today, while dealers generally are talking $30. Supplies are extremely limited while consumers are eager to secure tonnages to make up the deficiency in shipments of pig iron. Wrought and malleable scrap also are in good demand while another active grade is rerolling rails, in which business is reported at considerably above the quotations. Demand for the latter grade is accounted for by the fact that a good market exists for light sections rolled from old rails and also for concrete reinforcing bars. While demands for the purely steel-plant grades still are limited, consumers are issuing permits freely against tonnages due them on contracts. It is believed that with the clearing up of the labor situation an active buying movement will start, and already this expectation is finding some reflection in sellers' views. While no business of any account has been done in heavy melting steel higher than $21, delivered, recently, a bid of that price today would get practically no consideration. Some business in low phosphorus is noted at $25. Not much interest yet is apparent in bundled and baled sheet scrap.

Boston Market is Active

Boston, Nov. 3.—The scrap iron and steel market is again active. Pennsylvania furnaces have been buying large tonnages here during the week and an exceptionally strong demand exists from New England consumers. Blast furnaces in Pennsylvania have been particularly urgent buyers and a sale of 1000 tons at the going market figure is reported for one such furnace. Many grades have advanced in price and No. 1 machinery is particularly active and hard to obtain. Cast iron borings have sold at $16 and turnings and foundry scrap have also jumped up in price. The district ordnance office continues to offer steel and brass scrap. An award of 125 tons of round steel bars was recently made by this office to the Garden City Plating & Mfg. Co. at $42.50 per net ton.

Cast Scrap in Demand

New York, Nov. 3.—The growing shortage of pig iron has resulted in a heavy demand for cast scrap in the local market. Consumers generally throughout the east are active, and a particularly good tonnage is now moving into New England. Reflecting this demand, prices are moving rapidly upward. No. 1 heavy cast is holding at $23.50 to $24, f.o.b. New York, an advance of $1, and No. 1 machinery cast at $24 to $25, a gain of approximately $1.25. Large tonnages of heavy melting steel and borings and turnings continue to move at advancing prices. Heavy melting steel is quoted at $15.75 to $16.50, and a similar gain of about $1 is noted in offers for machine shop turnings and clean cast borings. Other descriptions are not in such heavy demand, although an improvement is in evidence all along the line.

Buys Tonnage of Steel

Philadelphia, Nov. 3.—The Lukens Steel Co. which did not participate in the buying movement in scrap here a few weeks ago has bought 15,000 tons of heavy melting steel the past week. It is understood around $20 delivered was paid for most of this tonnage but it is said that practically all the tonnage was cleaned up that was obtainable at this figure. Other grades of scrap are in good demand particularly cast scrap, forge and bundled sheets and all borings and turnings. Blast furnaces have bought round tonnages of machine shop and blast furnace turnings and rolling mills and steel works have bought good tonnages of machine shop turnings and cast borings. The biggest buyer was the Central Iron & Steel Co. which sent out a letter offering $18 delivered for clean cast borings.

Buffalo Market is Strong

Buffalo, Nov. 4.—Mills are again coming into the scrap market, and some of those in the Buffalo district are buying extensively. There is a steady demand from outside districts. The preference seems to be for heavy melting steel, car wheels, malleable, cast scrap and cast borings. The market is strong and dealers say that if it were not for the coal strike, the market would be in a very satisfactory condition.

Market Tone is Strong

Cleveland, Nov. 4.—Scrap iron and steel dealers here are expressing a great deal more activity than they have been the past few weeks, but are doing practically no more trading. Bids are being asked and given on a great many lots, while some efforts have been made to locate shipments for use "after the strike ends." But no actual trading has occurred so far. Some of the foundry grades have been pushed up 25 to 50 cents during the week. The tone of the entire market is strong, and quite a flourishing business is looked for once the coal and steel strikes are ended.

Chicago Demand is Good

Chicago, Nov. 4.—Consumers of iron and steel scrap are taking good tonnages of practically all grades, although heavy melting steel and similar descriptions are not quite as active as others. There is considerable scarcity of cast scrap, stove plate and rerolling rails, and recently No. 1 wrought has been difficult to obtain. The Chicago & Northwestern is offering 4000 tons of scrap, including 1000 tons of No. 1 rails and 300 tons of malleable scrap, the Chicago, St. Paul, Minneapolis & Omaha, 1050 tons, and the Chicago, Burlington & Quincy, 300 tons.

Car Supply Still Short

Cincinnati, Nov. 3.—With the exception of cast borings, which are a trifle firmer and are now quoted around $10.50, there are no changes in scrap prices. The car supply is still deficient and business under way is limited. There is a better demand for heavy melting steel from the outside, but cars cannot be obtained. Dealers see no prospect for improvement until labor troubles are settled.

St. Louis Prices Advanced

St. Louis, Nov. 1.—Prices of practically all grades of scrap have advanced, and the trend continues upward. The strength is based chiefly on speculative activity. Dealers and yard interests are bullish and are unwilling to sell at current quotations. Industries are buying only when absolutely necessary, and many are covered by contracts. Rolling mill grades are particularly strong, although no large sales are reported. Little cast scrap is to be had and inquiries bring out prohibitive prices. Rerollers are much in demand, with none coming out, and the inquiry from the oil regions of the Southwest is insistant. Even busheling and horseshoes have advanced, the latter going up $1 to $21 to $21.50. The country is sending in nothing and no railroad lists have been issued, though several are looked for.

Quotations Tending Upward

Birmingham, Ala., Nov. 4.—Scrap iron and steel quotations in the South are tending upward, as the market begins to show some life. Dealers say consumers are showing evidence of needing old material. No. 1 cast is now up to $24 to $25, stove plate is selling at $22.50, while heavy melting stel is held at $20.

Prices Increased

By Another Maker of Wrought Iron Pipe—Production Behind

Pittsburgh, Nov. 4.—The A. M. Byers Co. has announced an advance of $8 a ton in lapweld and $10 a ton in buttweld pipe, making the base discount on ¾ to 1½-inch buttweld 34½ per cent on black, and 18½ per cent on galvanized, while the base discount on lapweld, 2½ to 6-inch, is 30½ per cent on black, and 17½ per cent on galvanized. The Wheeling Steel & Iron Co. some time ago raised its prices on steel pipe. With these exceptions, however, makers of tubular goods are holding to the March 21 prices and are making no attempt to obtain higher prices. Although general production is much behind the demand and supplies, especially of oil country goods, are so urgently needed

by some buyers that they would be willing to pay premiums, manufacturers are giving little consideration to new business except to take on limited tonnages from regular customers. Wheeling manufacturers still are down and the recovery from the effects of the strike in Youngstown, O., is rather slow, although it is probable that with the order of the Amalgamated Association of Iron, Steel and Tin Workers that its members resume work with companies which had signed the scale, the Girard, O., plant of the A. M. Byers Co. will resume shortly. The National Tube Co. maintains normal operations at all of its plants except Benwood, W. Va., which is down, and the Pennsylvania works in Pittsburgh. At the latter an additional furnace has been put on this week, bringing operations to 80 per cent of normal and 67 per cent of the total. The Jones & Laughlin Steel Co. is running its pipe mills at Woodlawn, Pa., 100 per cent, but is neither quoting nor taking new business at present.

Mills Flooded

By Demand for Wire Products—Offer High for Nails

Pittsburgh, Nov. 4.—It is extremely difficult if not impossible for buyers to place orders for wire or wire products at present, for while production is gaining steadily the output is under contract. One company had a little available tonnage for shipment this year, but fearing that present obligations might become a liability in 1920 in the event the coal strike interferes with shipments, it withdrew. Other makers are filling old orders to the best of their ability. Prices are of minor consideration with buyers who need wire nails, it being reported that they have offered as high as $4, Pittsburgh. It also is said that $4.25 and even $4.50 have been offered by foreign buyers. Pittsburgh district plants of the American Steel & Wire Co. are doing better than at any time since the strike began. At the Donora works the company has the blooming mill on double turn, and is operating six open-hearth furnaces, one blast furnace and two rod mills, while all of the finishing mills and the zinc works are operating, though far from full. At Braddock and Rankin, the rod mills are working double turns and all finishing capacity is running. The Jones & Laughlin Steel Co. is running normally, but the Cambria Steel Co. has not yet resumed and valley plants are gaining slowly.

Mills Are Buried

Chicago, Nov. 4.—Demand for wire and wire products continues much heavier than mills can accommodate and much care is being exercised in accepting further business. Operating conditions continue much disturbed as a result of the strike of steel workers, although production is gaining steadily. Shipments are much under normal and mills are refraining from bidding on much of the inquiry which comes to them. Only regular customers are able now to place business.

Sheet Production

Shows Further Improvement — Mill Operations on the Increase

Pittsburgh, Nov. 4.—The position of sheetmakers both in the matter of active capacity and in production shows further improvement. The American Sheet & Tin Plate Co. today has 88 per cent of its sheet mills in operation and has brought production up considerably in the past week because more men have returned. Independent mill operations also have been increased due to the resumption yesterday of the Newport Rolling Mills, Newport, Ky., which suspended operations before Sept. 22. All makers are running rather light in their galvanizing departments which were manned largely by foreigners, comparatively few of whom have come back. Some difficulty also is being experienced in getting production of highly finished sheets up to the requirements of consumers, but the situation in this direction is better than recently. It is reported that some of the independent companies are obtaining premiums over the March 21 bases for prompt shipment, but as practically all of the current production is needed to meet contract obligations, little business can be accepted except at the expense of old obligations. Makers generally are inclined to satisfy these demands before giving consideration to new orders. About all the tonnage available for early shipment is from warehouses or manufacturers' stocks.

Pay Premiums for Sheets

Philadelphia, Nov. 4.—The leading eastern sheetmaker continues out of the market because of a strike in the sheet mill, and most of the other makers are not selling. Sheets are very hard to get, and premiums of from $10 to $15 a ton have been paid during the past week.

No Tonnage is Available

Youngstown, O., Nov. 4.—Consumers of sheets who look to Mahoning valley mills for their supply are encountering much trouble because practically no tonnage of any grade is available. This weeks' mails contained many heavy orders which the active mills declined to accept on account of their sold-up condition. Makers whose mills are idle are not entertaining any further business. Buyers particularly are anxious for No. 26 gage and lighter in both black and galvanized. Little encouragement, however, is held out to buyers of these gages so far as valley shipments are concerned. Only two sheet-mill plants are rolling and these are booked solidly for the balance of the year. Two additional plants are making every effort to get under way this week. Notwithstanding the heavy demand for sheets, no effort is being made to obtain higher prices.

In order to obtain any grade of sheets, jobbers and dealers are obliged to go out of this territory. They are successful in locating small tonnages at times but are compelled to pay substantial premiums for firm business. They experience no trouble in disposing of 50 or 100 tons of black or galvanized, and can get almost any figure they set on spot shipments.

Higher Prices

Of from $2 to $5 Definitely Established on Semifinished Material

Cleveland, Nov. 4.—Semifinished steel is on a definitely higher price basis of from $2 to $4 per ton. Settlements of large tonnages under term contracts have been made by mutual agreement between buyers and sellers on the basis of $40.50 Pittsburgh and Youngstown for 4 x 4-inch billets, $44 for small billets, $43 for slabs and $45 for sheet bars. Local makers are receiving heavy inquiries for sheet bars but are unable to accept any of this business on account of their reduced output and contract obligations. The local maker of semifinished steel now is operating at two-thirds capacity.

Billets Quiet in East

Philadelphia, Nov. 4.—While billets are quiet, some slab tonnage has been sold in the East at higher than $45, delivered.

Sheet Bar Shortage Still Acute

Pittsburgh, Nov. 4.—Although the Carnegie Steel Co. now is operating more than 70 per cent of its ingot capacity, other producers, especially in the Youngstown and Wheeling districts, have made only moderate recovery toward normal production of steel. Shortage of sheet bars is especially marked and makers having any tonnage available for the open market have no trouble in obtaining premiums of $3 a ton or more over the March 21 base. At the same time few sheet or tin plate mills are down as a result of the scarcity of steel. A recent sale by a valley producer of 250 tons of standard bessemer billets for shipment east was made at $42, or $3.50 above the old base. The scarcity of billets, however, is far less pronounced than that of sheet bars, due to the fact that more sheet and tin plate capacity is active today than is the case with merchant mills and others rolling billets. Wire rods are in demand from both domestic and foreign sources. One maker reports having turned down an export order from South America for 6000 tons.

Strip Production Lags

Pittsburgh, Nov. 4.—Although makers of strip steel in this district are operating fairly well, production in the country is considerably behind requirements, and since the demand is chiefly from automobile manufacturers anxious to keep up car output, the makers whose plants are operating are being pressed for delivery on old orders. The West Leechburg Steel Co., West Leechburg, Pa., still is crippled as a result of the strike, but the Superior Steel Corp. has its plant at Carnegie, Pa., running practically full and practically normal conditions also prevail at the plant of the Weirton Steel Co., Weirton, W. Va.

Steel Bars Are Scarce

Many Mills Out of Market—Production Gains in Valley and Chicago—Bar Iron, Rivets and Nuts Advanced

Chicago, Nov. 4.—With mill operation increasing steadily, the situation as to soft steel bars is growing better each week and demand is more than keeping pace. However, much care is being used in shipments in an effort to keep consumers as well supplied as possible. Mill operation under present circumstances is not efficient and less steel is being shipped than would be indicated by the percentage of men employed. However, the men are fitting in to their places better and the percentage of production is being increased markedly. A recent inquiry from Canada asks about 1800 tons of bars and shapes for the fabrication of 985 transmission towers.

Demand for bar iron continues strong and orders on books are increasing faster than shipments are made, giving something of a backlog, a thing which has been lacking in this product for many months. Railroads continue to remain out of this market except for a few small tonnages. The quotation is unchanged at 2.72c, Chicago mill.

Demand for hard steel bars rerolled from rails continues strong and most mills are now sold up for their production to the end of the year. The quotation is unchanged at 2.65c, mill.

Bars Scarce; Nuts Advanced

Philadelphia, Nov. 4.—Steel bars are hard to get. The Cambria Steel Co. is not yet quoting, while Jones & Laughlin Steel Co. and the Bethlehem Steel Co. are out of the market. Orders can be placed only by scouring the market thoroughly. Mills that are operating are doing all they can to take care of customers. Iron bars are quoted at 2.50c to 2.75c, Pittsburgh, most makers naming the latter figure. Nuts have been advanced 40 cents per 100 pounds. Blank nuts were quoted at 3.10c off list, Pittsburgh, but are now 2.70c off. Tapped nuts were 2.85c off, and now are 2.45c off. The Hog island shipyards have placed orders for 1350 kegs of bolts, and other shipyards have placed good orders. The Emergency Fleet corporation is in market for 500 kegs.

Exporters Pay Premiums

New York, Nov. 4.—So scarce are steel bars, that interests wanting to buy them for export have been forced to offer substantial premiums in order to interest the makers. One exporter has placed an order for 250 tons of steel bars at 4.00c, Pittsburgh. Another exporter says that the best price that he is able to get on 2000 tons of steel bars for abroad is 4.50c, Pittsburgh.

Production is Smaller

Pittsburgh, Nov. 4.—Scarcity of merchant steel bars finally has affected the operations of makers of cold-finished steel bars. Those companies depending upon valley steel plants for their steel or bars have not been getting shipments recently and have practically exhausted their reserve stocks. Automobile and tractor production is threatened by this decline in production. Great difficulty is being experienced in securing full shipments of highly finished sheets such as are required for automobile construction and makers of steel springs for cushions also are much behind in their deliveries. On top of these conditions comes the decline in the output of cold-finished steel bars and makers of automobile accessories are hard put through their inability to secure sufficient supplies of screw stock. Makers are holding to 2.60c base Pittsburgh although demands are urgent and if they were so disposed they might obtain premiums.

Special Extras Are Named

Cleveland, Nov. 4.—Manufacturing consumers are inquiring actively for bars and other form of steel for first quarter delivery, in order to protect themselves on programs and estimating work which they have before them. Some of the automobile accessories manufacturers are among this number. Certain of the leading steel makers still are unwilling to quote for that period. Others while disinclined to ask advances on base prices, in cases are quoting special extras; in one instance a $3 per ton charge for chipping blooms was named on an inquiry for rounds. Bars for early shipment are scarce and usually can only be obtained from warehouse stock.

Iron Bars Are Higher

Pittsburgh, Nov. 4.—Leading makers of iron bars in this district have made an increase of $5 a ton since a week ago and now are quoting common merchant iron at 3.00c base, Pittsburgh, and refined at 3.25c base Pittsburgh. Demand is reported to be heavy, partly because of the shortage of soft steel bars. Another reason for the advance is that raw material costs are tending higher. The situation as far as operation and production are concerned in merchant steel bars is somewhat better this week than it was last, due to the fact that the Youngstown, O., district bar mills gradually are coming back. Three of the four bar mills of the McDonald plant of the Carnegie Steel Co. at Youngstown started up this week after being shut down since the first day of the strike due to the cutting off of the power which this plant obtained from the Ohio works of the same company. One additional bar mill was put on at the Upper and Lower Union Mills of the Carnegie Steel Co. at Youngstown, making a total of eight out of 12 mills now in operation. The Carnegie Steel Co. is still 2.35c base, Pittsburgh, for steel bars but is taking no early delivery orders. Some of the larger independent companies are neither quoting or accepting business in bars. In the smaller sizes makers are extremely heavily committed and prompt shipment practically is unavailable.

Bolt Quotations Higher

Chicago, Nov. 4.—Under strong demand for nuts and bolts, which exceed the ability of makers to meet, some sellers are quoting 10 per cent over the prevailing schedule. However, this is not general and most bids are at the schedule. Under present conditions of pressure, most makers are able to take new business only from regular customers.

Prices Tend Upward

Pittsburgh, Nov. 4.—Stronger tendencies are noted in prices of nuts, bolts, and rivets as a result of a good demand and the fact that good production is more or less affected by the scarcity of rods and bars. Some makers now are quoting 4.15c for structural rivets and 4.25c for boiler rivets. Smaller rivets are quoted as high as 15 per cent off list. Both carriage and machine bolts are quoted higher and few makers of nuts are quoting less than 2.70c off on blank nuts and 2.45 off on tapped.

Orders Backing Up

Pittsburgh, Nov. 4.—Considerable backing up of orders for hoops and bands is noted by makers in this district as production remains considerably behind contract obligations. Automobile manufacturers were heavy buyers of band steel earlier in the year and in their efforts to keep up production are pressing makers for deliveries. The situation in cotton ties is relatively easy. Makers have sufficient stock to accommodate all specifications. The November price of ties is $1.77½ a bundle of 45 pounds in lots of 3000 bundles or more.

Spot Ferro

Sells at $115 and English Metal at $100—Ferrosilicon Higher

New York, Nov. 4.—Spot ferromanganese has been scarce of late with the result that some of this metal has been bought during the past few days at $115, delivered, for 80 per cent, an advance of $5 over the previous quotable market. The amount of business done was small. In fact, demand is very quiet. The market now may be quoted at $110 to $115, delivered. Recently, some 70 per cent metal changed hands at $90 to $100 per ton delivered. No English ferromanganese now is being offered. One English maker, which recently authorized its agent here to sell at $100, c.i.f. tide-water, has withdrawn this authorization and is out of the American market for this year. It is understood considerable domestic buying of ferromanganese has been done in England as a result of the recent reduction in prices there.

A stronger tone is noted in spiegeleisen, and sales of 500 to 1000 tons of 19 to 21 per cent metal have been made during the past few days at $35 furnace.

Offerings of imported ferrochrome now appear to have been absorbed

and the low prices recently quoted have disappeared. The supplies of foreign material involved a considerable tonnage in the aggregate and were disposed of at prices ranging from 16 to 24 cents, delivered. American makers are quoting 27 cents and upward, per pound contained, for alloy containing 4 to 6 per cent carbon. It is understood an increasing quantity of alloy containing 6 to 8 per cent carbon now is being marketed, at prices about 1 cent a pound below the price for alloy containing 4 to 6 per cent carbon. Alloy containing 2 to 4 per cent carbon is quoted 34 cents a pound contained and less than 1 per cent carbon is quoted about 70 cents a pound contained.

Makers of standard ferrotungsten are holding at $1.25 a pound contained, but business has been done in imported alloy down to $1.10 a pound contained.

Ferrosilicon remains quiet. Sales of 50 per cent ferrosilicon are reported at less than $80, delivered Pittsburgh district. Several manufacturers who have ceased to operate but who have stocks of alloy have been unloading at the best price.

English Ferro Sold at $100

Philadelphia, Nov. 4.—Eastern consumers have bought several hundred tons of English ferromanganese for the first quarter at $100, tidewater, on offers outstanding for some weeks. No English metal now is being offered. The demand for ferromanganese is better, and several sales of domestic metal for nearby delivery have been made at $110, delivered.

Sell Spiegeleisen for First Half

Pittsburgh, Nov. 4.—Sales of spiegeleisen for delivery over the first half of 1920 comprise the most recent development of interest in the ferroalloys market here. Sales of at least 2000 tons have been made to Pittsburgh district consumers and it is understood that a deal is pending for 1000 tons more. This business was done at about $35, furnace, for 18 to 22 per cent material.

Not much activity is noted in ferromanganese, but the market shows a stronger tendency in domestic material than it did recently as some uncertainty has arisen as to the ability of English producers to make deliveries. As a result, American manufacturers are no longer inclined to shade their asking price of $110, delivered, for 80 per cent.

Sales of 50 per cent ferrosilicon still are in small lots, around $80, delivered Pittsburgh. Domestic makers generally are asking $85 or more, but Canadian makers are quoting $80, and in some cases less, and are getting most of the business.

Bessemer Ferrosilicon Advanced

Cleveland, Nov. 4.—Ohio makers have advanced bessemer ferrosilicon for first half $5 a ton to $54.75 furnace for 10 per cent, $58.05 for 11 per cent and $61.35 for 12 per cent. About 2500 tons of this metal chiefly 10 per cent recently have been placed in this district at several dollars under the schedule and this is ascribed either to resale offerings which in some cases were met by the producers.

Want Many Ship Plates

Chicago Has 30,000-Ton and Pittsburgh 25,000-Ton Inquiries—Eastern Contracts Take 30,000 to 35,000 Tons—22,000 Tons Placed

Chicago, Nov. 4.—Numerous factors are giving the plate market great strength and demand for this form of finished steel is increasing steadily. An inquiry has been received from a shipbuilder on the Pacific coast for 30,000 tons of ship material, of which about two-thirds is plates. Another inquiry asks for 2500 tons of plates, shapes and bars for five coast guard cutters. Most of this material is plates. Carbuilders have been taking contracts for repair of rolling stock, the railroad administration making efforts to put equipment in shape before the roads are turned back to their owners. One interest in Chicago has received inquiries recently for about 15,000 tons of steel, mostly plates, for this purpose. Plates are steady on the basis of 2.94c Chicago.

Boats Let—Export Demand Active

New York, Nov. 1.—A big demand for plates continues to come out in this market from export sources and the mills say that they are having no difficulty in obtaining 2.65c, Pittsburgh, for all the tonnage they will take. These orders run into hundreds of tons daily. Present export orders are running to the lighter gages and a great many of the orders being booked involve ⅛ and 3/16-inch material. The eight tankers which tentatively were placed by the Atlantic Gulf & West Indies Steamship Co. finally have been closed. Two 14,800-ton tankers were placed with the Newport News Shipbuilding & Drydock Co., four 12,600-ton with the Bethlehem Shipbuilding Corp. and two 10,600-ton with the Sun Shipbuilding Co. These vessels require 30,000 to 35,000 tons of plates and shapes. Many additional boats for various buyers are expected to be placed with eastern yards shortly.

Large Orders Placed in East

Philadelphia, Nov. 4.—A brisk demand for plates continues in the east and one leading mill reports it is quoting 2.75c, Pittsburgh, in some cases to hold off orders. Numerous orders were placed during the past week involving several thousand tons each, including several good orders from shipyards. The Bath Iron Works has bought 3500 tons of steel plates for two boats for the Crowell & Thurlow Co., Boston. It is reported here that a contract for 10 boats has been let on the Pacific coast, but the details are not known. An eastern mill has been given 22,000 tons of plates covering ship work recently placed.

Again Offering Tonnage

Cleveland, Nov. 4.—Some independent steel makers which a week ago withdrew from the market have resumed offering of plates for shipment at the maker's convenience at 2.65c Pittsburgh. Local shipbuilders who have been bidding on small boats requiring about 2500 tons, did not obtain this business. They have since sought protection on 1000 tons for similar work. Local plate production is on the increase.

Light-Gage Orders Heavy

Pittsburgh, Nov. 4.—Platemakers in this district have all the business they can fill during the next 60 days with bookings especially heavy in the lighter gages. As has been the case for several months, the principal demand is from the makers of tanks and the fabricating interests, but recently some good sized export inquiries have been noted for ship plates. One inquiry calls for 25,000 tons of plates in addition to 10,000 tons of shapes and 5000 tons of bars, the inquiry coming from France. Although new demands are frequent and urgent, and some buyers probably would be willing to pay more money for prompt deliveries, the Carnegie Steel Co. is holding at the March 21 base of 2.65c, Pittsburgh, and other makers are not making much effort to boost prices.

Tin Plate Output

Steadily Increasing—Heavy Demands Coming From Domestic Consumers

Pittsburgh, Nov. 4.—Tin plate mill operations have made a further gain with the American Sheet & Tin Plate Co. now operating more than 60 per cent of its mills. The McKeesport Tin Plate Co., has 24 of its 44 mills operating and will increase the number as it is able to work off the heavy accumulation of tin mill black sheets. The Standard Tin Plate Co., at Canonsburg, Pa., is somewhat hampered by a shortage of steel, but the Canonsburg Steel & Iron Works and the Washington Tin Plate Co., are reported to be operating practically normal. The American Sheet & Tin Plate Co. has 10 of its mills at Elwood, Ind., in operation, a gain of four over a week ago, and is maintaining the gains made elsewhere in the past fortnight. This company has 14 of its sheet and tin plate mills running 100 per cent. Heavy demands still are coming out for tin plate from domestic consumers for early delivery, but they are having considerable trouble in interesting makers. Some of the latter are neither quoting nor accepting business fearing to become obligated too far ahead in the event that the coal strike interferes with shipments. Sales of stock tin plate are being made at the full market price of $7 per base box, Pittsburgh, and this material is understood to be moving to consumers as high as $7.50.

Directors of the Packard Motor Car Co., Detroit, have voted to decrease the par value of the common shares from $100 to $10.

Export Shapes Placed

Various Countries Buyers of Sizable Lots of Eastern Mills—20,000-Ton Order For India Closed—Domestic Contracts Numerous

Philadelphia, Nov. 4.—Demand for shapes is active, and mills cannot promise delivery of some sections before two or three months. A considerable tonnage of shapes for ships was placed here recently. The past week's business includes numerous export tonnages, of which 1500 are for Japan, 1000 for South America and 700 for the Dutch East Indies. There are export orders for from 5000 to 10,000 tons pending. A considerable tonnage will be required for large plant extensions for the Willys Corp., Elizabeth, N. J., the general contract for which has been let. There is some talk among eastern shape makers of quoting higher prices to keep business away, as it is coming in too fast in some cases to be handled. Costs are said to be very high.

Ask Bids for Many Buildings

Boston, Nov. 3.—An increased number of buildings open to bids during the week has brought an easier feeling among construction circles here. The awards for steel construction outside of the new First National bank building have fallen off slightly, however, below the total of the previous week. The First National bank building which was awarded to Stone & Webster Engineering Corp., Boston, will require about 3000 tons of structural steel although definite figures have not been given.

October Awards Are Less

New York, Nov. 3.—Although no definite figures are available, it is generally believed that structural lettings in October aggregated less than in the preceding month. Tonnage was placed somewhat freely during the latter half, but it was not sufficient to make for the lull in the early part according to usually well informed interests. During the past few days new inquiry has been small, few sizable tonnages coming out. However, there has been a fair amount of buying.

Large Foreign Contract Let

Pittsburgh, Nov. 4.—The contract for the steel plant building of the Tata Iron & Steel Co., Sakchi, India, has just been let to the McClintic-Marshall Co., and comprises the largest structural award announced for sometime. The business includes the steel for practically all of the buildings of the plant, about 20,000 tons. A large number of structural projects are in prospect, but investors are inclined to move slowly in placing them pending a clearing of the labor situation.

Vote on Many Building Projects

Cleveland, Nov. 4.—Elections throughout Ohio today on the issuance of many millions of dollars in school bonds are expected to bring forth new building projects for figuring during the slack winter months. Cleveland already has a $5,000,000 school building program mapped out, while Cincinnati also has decided to go ahead with building projects calling for the expenditure of several million dollars.

The Fort Pitt Bridge Works is understood to have obtained one of the largest contracts recently let in Cleveland. This is for 5000 tons of structural shapes for the Buckley building, a combination theater, garage and office building. Several smaller jobs were let during the week. New jobs are being figured, there apparently being no let up in work coming out.

About 3000 to 4000 tons of bridge work for the Pennsylvania, Hocking valley and other railroads have been let to the Mt. Vernon Bridge Co.

Many Projects Closed

Chicago, Nov. 4.—After a fairly quiet season covering the past few weeks, a number of important structural projects have been closed in the west. The John Crerar library at Chicago, requiring 1450 tons, and the Farmers & Mechanics bank building, at Fort Worth, Tex., 1700 tons, have been awarded. Bids will be opened Nov. 15 on 15,000 to 20,000 tons of steel for the Union station, Chicago. This tonnage has been up in previous years, but various interruptions have prevented its being placed.

CONTRACTS AWARDED

Ambassador hotel, Atlantic City, 2000 tons to Heddon Iron Construction Co.

Art museum, Philadelphia, 875 tons to independent shop.

Farmers & Mechanics bank building, Fort Worth, Tex., 1700 tons, to Decatur Bridge Co.

John Crerar library, Chicago, 1450 tons, to American Bridge Co.

Cattle barn and sale ring for department of agriculture, state of Iowa, at Des Moines, 525 tons, to Pittsburgh-Des Moines Steel Co.

Foundry building for Bridge & Beach Mfg. Co., St. Louis, 397 tons, to Christopher & Simpson.

Scottish Rite temple for Bloomington consistory, Bloomington, Ill., 320 tons, to Decatur Bridge Co.

Building for East St. Louis plant, for St. Louis Pressed Steel Co., East St. Louis, Ill., 220 tons, to Stupp Bros.

Viaduct for the city of Twin Falls, Idaho, 209 tons, to Missouri Valley Bridge & Iron Co.

Addition to Plymouth mills, Lawrence, Mass., 250 tons, let to American Bridge Co.

Addition to International Boiler Works, Straussburg, Pa., 600 tons, let to independent.

Art museum, Philadelphia, 875 tons, let to independent.

Apartment house, Philadelphia, 400 tons, let to Phoenix Bridge Co.

New Ambassador hotel, Atlantic City, 2000 tons, let to the Hedden Iron Construction Co.

Government hangars, Newdorp, Staten island, approximately 650 tons, general contract let to Smith, Hauser & McIsaac.

Building for First National bank, Boston, approximately 300 tons; to Stone & Webster Engineering Corp.

Building for New England Tel. & Tel. Co., 800 tons, to New England Structural Co.

Steel plant building for the Tata Iron and Steel Co., Sakehi, India, 20,000 tons to the McClintic-Marshall Co.

Building for the American Steel Foundries, Alliance, O., 450 tons to the McClintic-Marshall Co.

Wheel shop extension for the Hockensmith Steel & Iron Co. and Wheel and Mine Car Co., Penn State Pa., 150 tons to the McClintic-Marshall Co.

Additions and improvements to the plant of the Union Shipbuilding Co., Baltimore, 5000 tons to the McClintic-Marshall Co.

Buckley building, Cleveland, 5000 tons; let to Fort Pitt Bridge Works.

Building for Walker Motor Co., Cleveland, 250 tons; let to Forest City Steel & Iron Co.

School building, Troy, O., 100 tons; let to Fred S. Fravel Co., Columbus, O.

School building, Fletcher, O., 100 tons; let to Fred S. Fravel Co.

School building, Cleveland Heights, O., 60 tons; let to Republic Structural Iron Co.

Cleveland avenue viaduct, Columbus, for Pennsylvania railroad, to Mt. Vernon Bridge Co.

Miscellaneous railroad bridge work, 3000 to 3500 tons to Mt. Vernon Bridge Co.

Building for Stevens-Duryea Co., Holyoke, Mass., 350 tons, to Phoenix Iron Co.

Building for Worth Steel Co., Claymont, Del., 1500 tons, to Phoenix Iron Co.

CONTRACTS PENDING

Union station, Chicago, 15,000 to 20,000 tons, bids to be taken Nov. 15.

Addition for American Steel Foundries, Detroit, 600 tons, bids asked.

Theater for Panacea Theater Co., Chicago, 300 tons, bids asked.

Building for Guide Motor Co., Cleveland, 250 tons; general contract let to Crowell & Little, Cleveland.

Building for *Cleveland Plain Dealer*, Cleveland, 200 tons; general contract let to Crowell & Little.

Building for National Electric Lamp association of the General Electric Co., St. Louis, 500 tons; bids being taken.

Bank and office building for Steubenville Bank & Trust Co., Steubenville, O., tonnage indefinite, bids being taken.

Factory for Portage Rubber Co., Barberton, O., tonnage indefinite; bids being taken.

Building for Republic Brass Co., Cleveland, 200 tons; general contract let to Sam W. Emerson Co.

Plant extensions for Willys Corp., Elizabeth, N. J., tonnage indefinite; general contract let to Warren Moore & Co., Philadelphia.

Rail Tonnages

Becoming More Active—Pennsy Asks 200,000 Tons—41,000 Tons Placed

Philadelphia, Nov. 4.—An inquiry for 200,000 tons of rails for next year's delivery has been issued by the Pennsylvania lines east. It is provided in connection with this inquiry that if the orders are placed, they are subject to cancellation in the event government control continues. Eastern makers are not inclined to quote because they do not know what their costs will be.

Administration Buys 41,000 Tons

Washington, Nov. 4.—An award of approximately 41,000 tons of open hearth rails has been made to the Bethlehem Steel Corp. by the railroad administration at $47 mill for delivery beginning at once and to be completed by Jan. 1. This is the only portion to be placed of the 200,000 tons upon which bids were taken several months ago. It represents the absolutely necessary tonnage for the upkeep of eastern roads which can take delivery from the Bethlehem mills. No indications are given as to when the remainder of the original inquiry may be placed.

Roads Looking Ahead

Chicago, Nov. 4.—Considerable inquiry for standard steel rails for 1920 delivery is being put out by western roads. This is of a tentative character, however, as the railroads do not appear to be certain of their ground, although it is expected the government will relinquish its hold at the end of this year. Under present circumstances it is not possible for contracts to be made but the preliminary inquiry is coming out and about 100,000 tons of rails are involved. Practically the same condition is true of track fastenings, which are in strong inquiry, but comparatively little buying is actually being done.

Exports Temporarily Checked

Higher Prices Fail to Cut Off Foreign Purchases of Light Steel Goods, However, Failure of Transportation Offers the Greatest Hindrance to Business—Big Order for Structural Steel Placed for India

NEW YORK, Nov. 3.—Export trade still is being hampered by the strike situation. Although mill production has picked up considerably and many export houses have not been frustrated entirely in their efforts in placing foreign orders, the tie-up in transportation is a serious detriment. The port of New York has been embargoed for practically four weeks. The railroads have rescinded their orders for issuing g. o. c. permits and such products intended for loading on board ships as have been successful in escaping the embargo have been diverted into other ports. The effort of the railroad administration to move all coal possible before the miners' strike caused a diversion of gondola cars. It is absolutely necessary to ship certain iron and steel products in gondola cars. Since only box cars have been available in certain sections of the country the export trade has been blocked likewise in this way.

The ingenuity of the export house to obtain the goods desired by the foreign purchaser is at the moment a precious asset. An unusually large number of ships have been tied up at the docks in the harbor of New York due to the trouble with the longshoremen. This has resulted in removing much available tonnage from the field temporarily. Yet ocean rates have not advanced. The shipping board has, on the other hand, put into effect new schedules reducing the rates. The rates to North Africa, Red Sea and Levant were reduced 10 per cent. The steamship operations are preparing for further reductions in ocean rates after the first of the year.

All of this only goes to show that while it is difficult at present to ship out of the country, the tendency is in favor of exporting. On the other hand the orders and inquiries from abroad have decreased perceptibly, but it is believed this also is but a temporary condition. Two months ago the volume of foreign inquiries in the market gave cause for greatest optimism. But the foreign purchasers have for one reason or another failed to place orders, and today they are holding off until they are assured that industrial conditions in the United States are tending once more to the normal.

Prices now being paid for exportable goods are so fluctuating that it is difficult to gage the market. The continuation of the unsettled industrial conditions makes this situation more confusing. The export demand for light steel goods, such as sheets, bars and wire products, is reported as very heavy. There is little in the way of immediate business on account of the oversold condition of the plants and the tendency toward higher prices.

Exporters generally are shopping around for the various materials that have a market abroad. One dealer who is accustomed to receive approximately 30 carloads a week at his warehouse said that now he is getting only about one, and in addition the mills are shipping him only small sizes and extremely large sizes, for which the demand is exceptional rather than common. Prices quoted on those commodities which are difficult to find are much higher than they were three weeks ago. One exporter buying 250 tons of bars was compelled to pay the mill 4.00c, Pittsburgh. The best quotation another exporter could get on 2000 tons of steel bars was 4.50c, Pittsburgh.

Despite this situation the market shows extreme activity, which undoubtedly is due to the necessity of expending more effort to find the commodity One of the big deals which went through recently was an order for 20,000 tons of fabricated plates and shapes for making extensions to the plant of the Tata Iron & Steel Co., at Jamshedpur, India. This order was placed with the McClintic-Marshall Co.

Oriental business appears to hold up fairly well. One company has contracted to erect two ice plants in China These will have a capacity of 20 tons each. An order has also been placed for the erection of a drag line cableway excavator in Singapore. A firm which has an order for bars for India was compelled to transship the goods and send them through Philadelphia.

A sale of 300 tons of light rails to Java was reported during the past week. Japan has sent in orders for 100 tons of shovel steel and 1250 tons of pipe. Japan is also in the market for 2000 boxes of tin plate. The inquirer has offered to pay $9 c.i.f., Kobe, but the domestic makers have been holding out for a higher price.

Among the sales reported made to South America was 100 tons of tire steel. Brazil has purchased a small tonnage of boiler tubes. Exporters have experienced great difficulty in getting their orders shipped from the mill. One house reported that it had a fair tonnage of heavy pipe, finished and held at the mills because no cars for moving were available. In another instance the exporter, who had sold a fair tonnage of pipe to Mexico was compelled to re-ship and send the tonnage through the port of New Orleans. Such shifting in the transportation plans is costly and another excuse for levying extra charges on foreign purchasers. Porto Rico has placed an order for a small tonnage of pipe.

The Nonferrous Metals

	‡Copper	Future Straits N. Y.*	†Lead, New York basis	Zinc St. Louis basis	Aluminum	Spot antimony	Nickel ingot

No. 4	Holiday in New York						

*Future shipment from Singapore.
† American Smelting & Refining Co.'s price.
‡Open market.

NEW YORK, Nov. 3.—Additional uncertainty was injected into the nonferrous metal markets the past week by the calling of the coal strike, which further discouraged consumers from committing themselves for future requirements.

The copper market declined under pressure of offerings from second hand sellers together with active participation in the market by leading producers, while demand was poor. Electrolytic copper for delivery this year sold down to 21.00c, New York. Producers, however, so far as known, did not shade 21.25c. There was some further buying of copper for export but this business remains low. Casting copper sold down to 20c, and lake copper sold down to 21.50c.

Active export inquiry for zinc was the feature of the zinc market. France, England, and Japan continued to show interest, while Germany also asked for prices on a large tonnage. Prime western sold down to 7.45c, last week, but on Monday recovered to 7.55c, East St. Louis basis. Demand from galvanizers and brass mills remains extremely slow, although some galvanizers, who several weeks ago asked that shipments on their contracts be held up, have resumed operations in some of their mills and soon will require shipment. High grade zinc sold at 8.37½c, to 8.50c, New York.

The lead market reflected further the strong statistical position of this metal. An active demand was experienced for spot supplies in the east, while outside sellers were able to obtain a premium over the quotation of the leading producer who maintained a price of 6.75c New York, 6.60c, East St. Louis. Early shipment lead sold by outside producers at 6.90c to 6.95c, New York.

The return of some of the striking longshoremen improved the situation as regards spot tin supplies slightly early this week, but the situation remains acute. Upwards of 8000 tons of tin of value of around $9,000,000 are tied up in the port. Straits tin for shipment from Singapore in November and December, was obtainable the past week at around 53.50c, f.o.b. New York, and for shipment the same months from London at the same figure. Spot Straits tin ex-store, was quoted 55.50c, to 56.00c, whereas tin on dock was quoted around 53.00c to 53.50c. Ninety-nine per cent tin was quoted about ¼c below the price of Straits tin.

Aluminum prices remain steady. Some imported Virgin ingot was offering at 32.50c, as against the producers' price of 33c. No. 12 alloy was firm at 30.50c. A number of foundries in the Middle West who have received requests to hold up shipments of aluminum castings from automobile builders and others, who in turn have been experiencing or anticipating a shortage in the supply of steel, have requested shipments of aluminum be held up. Demand for aluminum sheets is brisk, some mills being sold up for six months.

Coal Strike Having Little Effect

Iron and Steel Industry Has Supplies of Coke and Coal Sufficient for Four to Six Weeks—Walkout of Miners Fails to Complicate Steel Strike—Amalgamated Association Practically Withdraws Its Support

LATEST reports regarding the coal strike are to the effect that the strike will not interfere with or at least interrupt furnace and mill operations, unless it is continued beyond all expectations. With union officials enjoined from directing the strike and with the government striving in every way to force an early settlement, the general opinion is that the strike will be short lived. On the other hand, supplies of coke and coal at furnaces and mills are said to be ample for normal production for from four to six weeks, and in some instances, even for a longer period. Coke operators declare there is no cause for worry on the part of furnace interests, while the railroad and fuel administrations have released some of the coal seized at the outset of the strike, indicating that the government does not fear a serious shortage.

The coal strike has had no effect on the steel strike. Steel workers are returning in increasing numbers, despite the moral support the leaders may have hoped to obtain from the walkout in the coal regions. Mill interests have sought to reach a clear understanding with the Amalgamated Association of Iron, Steel and Tin Workers as to whether it purposes to honor its agreements, and the issue has been presented to the association in such a way as to leave no loophole. The association has practically withdrawn from the strike; more of its members showing a willingness to work. In the Pittsburgh district the strike has "simmered down to one involving only common labor."

Employes of three mill departments of the Bethlehem Steel Co., at South Bethlehem, Pa., have voted in favor of a 10-hour shift, instead of an 8-hour, and if a majority in the other departments concur the company will put it in effect.

Furnaces and mills in the Cleveland district which have been the slowest in making headway show the most gains of the week, while operations in the Youngstown and Chicago districts also have improved.

Association Withdrawing From Strike

PITTSBURGH, Nov. 4.—The steel strike has simmered down to one where only common labor is involved. Skilled workmen, most of whom were out because of intimidation, practically all have gone back to work in this district and much the same is the case in all other districts, with the exception of Wheeling. Perhaps the most significant development in connection with the strike has been the practical withdrawal of the Amalgamated Association of Iron, Steel and Tin Workers from the organizations which were responsible for the walkout.

This organization went into the movement against the best judgment of its officials, who were influenced by the fact they could not very well go contrary to the vote passed at the convention of the American Federation of Labor, with which it is affiliated, in St. Paul, Minn., in June last year, and also by the assurances that the strike would not involve the plants of the manufacturers who have signed agreements with it. Developments in the strike were contrary to the unions' expectations and plants operated under an amalgamated agreement went down with the others. This has been a matter of some concern to the Amalgamated officials and they have been busy lately in an effort to restore the contracts which were in serious danger of becoming void. This has resulted in undoing much of the work of the strike officers.

Outside of the shortage of common labor all manufacturers in the Pittsburgh district have more men back at work and more capacity in operation than since the first few days of the strike. Production also has made some gains, although it still is considerably behind what should be expected from the capacity which now is manned.

The coal strike finds most of the steel companies fairly well fortified by reserve supplies, although if the strike should be protracted a shortage certainly would develop. For operations of both boilers and by-product plants the companies in the Pittsburgh district may be said to have at least a month's normal supply of coal. The impression is quite general that the strike will be of short duration and that it will be practically over by next Monday. This belief is based on the expectation that the injunction secured by the government at Indianapolis last week will be made permanent on Saturday.

In this event it is figured that it will be but a step for the strike call to be rescinded, and this is expected, since only after the return of the strikers will the government act in the matter of setting up a court of arbitration to hear the case. The serious side of the present situation is contained in the railroad and fuel administrations' orders which make it extremely difficult for steel plants to secure fresh supplies of coal, since they are not included in the preference list of consumers. Union mines quite generally suspended operations on Saturday, but the nonunion mines are practically unaffected.

Bethlehem Employes Vote For 10-Hour Shift

New York, Nov. 4.—The Bethlehem Steel Co. Saturday received petitions signed by all employes of three departments of its South Bethlehem plants asking for a 10-hour basic day. The men said strikes and radicalism have gone far enough, and that the country is suffering for lack of production. They declared they know prevailing high prices are due to under-production, and they proposed to increase production to aid in getting the country back on a normal basis. They asked simply for 10 hours' pay for 10 hours' work.

The management has decided to put the question up to the entire works, and if the men desire to adopt the suggestion of the three departments they will be put on 10-hour shifts.

The Trenton plant of the John A. Roebling's Sons Co. is shut down for lack of coal, but operations are expected to be resumed as coal will be brought from the plant at Roebling, N. J.

Production of by-product coke in this district can be continued for three weeks with the supply of coal now on hand. The Seaboard By-Products

Coke Co., the leading producer in this territory, in addition to its stock, has 30,000 tons of coal enroute, but this coal is being confiscated right and left, so there is no certainty as to how much will be delivered. The Seaboard interest produces 1700 tons of coke per day and is an important source of supply for the foundries of New Jersey, New York, New England and eastern Pennsylvania. While the Camden Coke Co., Camden, N. J., produces 625 tons per day, a rather small percentage of it is used as foundry fuel. The Semet-Solvay Co., Syracuse, N. Y., produces about 100 tons per day.

More Mills in Valley on Productive Basis

Youngstown, O., Nov. 4.—Further improvement in steel-plant operation throughout the Mahoning valley is shown this week. Additional mills were placed on a productive basis Monday, which gives operators considerable encouragement. At the Ohio works of the Carnegie Steel Co., five open-hearth furnaces, which is two more than was reported last week, are making steel. One blast furnace, a bessemer converter and the blooming mill also are in operation at this works.

A 10-inch bar mill at the Upper Union works of the same company started rolling Monday. With the resumption of this unit, the company now has eight bar mills out of 12 in operation at this particular plant. At the McDonald plant further up the valley, two bar mills were placed under power and it is expected that additional units at this works will get under way before the end of the week.

Eight sheet mills at the Youngstown Sheet & Tube Co.'s plant were rolling today. Present orders warrant continued operation in this department throughout the week on a three-shift basis. Three stacks at this plant are blowing and expectations are that the fourth will be placed in blast this week. Operations in the bessemer and pipe-making departments show a decided increase. This company at its East Youngstown plant has every department, except its puddling mills, in operation.

Not much change is noted in operating conditions at the plants of the Brier Hill Steel Co., except that the car dumper and ore bridge again are handling ore. One blast furnace, five open hearths, the coke ovens and the blooming mill at its Brier Hill plant and one plate mill at its Mosier plant are working.

Several bar mills at the Brown-Bonnell plant of the Republic Iron & Steel Co. would have begun rolling and an additional open-hearth furnace would have been charged last Monday had it not been for the shortage of fuel. The company, however, continues to operate two blast furnaces and four open-hearth units with the fifth ready for charging. The DeForest group of sheet mills of the Republic company at Niles, O., is still idle. Structural iron workers employed in assembling the frame work for the new sheet-mill buildings of the Falcon Steel Co. there, recently were called off their jobs due to efforts of local steel plant strikers. Construction work at this plant is at a standstill.

The A. M. Byers Co., Girard, O., was successful Monday in starting 27 of its 88 puddle furnaces. The men who returned are affiliated with the Amalgamated Association of Iron, Steel and Tin Plate Workers and their action was sanctioned by M. F. Tighe, their national president. In general, however, more

No interruption of steel-plant operation due to the present coal strike is expected at valley mills for several weeks, most plants having a sufficient supply of fuel to carry them well into 1920 under present conditions.

Connellsville Miners Are Increasing Output

Uniontown, Pa., Nov. 4.—Coal production in the Connellsville district is increasing, due to the fact that the miners started a six-day week beginning Monday. The district is unaffected by the strike either at the mines or at the ovens, the United Mine Workers having failed in their efforts to organize the workers. While the miners in other districts walked out, those in the Connellsville district, who had been working but five days a week, carried out their intention to work six days. The general attitude was one of indifference as to what course is taken by the union miners in other districts, local conditions being satisfactory. In Washington county, where practically all of the mines are organized, about 20,000 men are out. Mines suspended include the Vesta mines of the Jones & Laughlin Steel Co., and three of the Pittsburgh Coal Co.

Operations of Cleveland Plants Increasing

Cleveland, Nov. 4.—Resumption of operations at least on a partial basis is reported by practically every iron and steel company in this district. One of the larger companies reports operations on practically a 100 per cent basis, while others report they would be operating at nearly normal capacity if repairs which are being made to their plants did not interfere.

Unless the coal strike lasts a greater length of time than is generally expected, blast furnace operators will not be handicapped by a lack of coal, as they have limited but sufficient supplies on hand to last for a while. Finishing mills report they have supplies of coal which were shipped in during the early part of the steel strike and which stood on track, due to the refusal of the men to unload them. These cars are now being unloaded.

About 40 per cent of the employes of the Lake Erie Bolt & Nut Co. have returned to work, and the bolt and nut departments are working on a partial basis. The blast furnace of the Upson Nut Co. is in operation, as are three out of five open-hearth furnaces. Officers of this company report enough men have returned to operate the finishing mills, but these departments have not been opened because of repairs now being made.

Two of the four blast furnaces of the McKinney Steel Co. are running. Two of four batteries of by-product coke ovens are operating, while eight of 14 open-hearth furnaces are operating and two others have been lighted. The blooming mill is rolling. This company has about 30 days' or more supply of coal on hand.

The Otis Steel Co. reports its Riverside plant operating on a 100 per cent basis, while more men are reporting daily at its Riverside plant. One furnace of the Cleveland Furnace Co. is in blast. Conditions have remained about the same during the week at the plants of the American Steel & Wire Co., subsidiary of the Steel corporation, though one of the central group of furnaces is going.

The return of men to work in large numbers on Monday at the plants of the Berger Mfg. Co. and the United Alloy Steel Corp., at Canton, O., is reported. In that city the Stark Rolling Mill is reported operating 16 of its 28 mills. Conditions at Massillon, O., also has materially improved.

Chicago Cokemakers Have Large Coal Supplies

CHICAGO, Nov. 3.—Production of by-product coke by steel plants and by companies manufacturing coke for the market is not expected to be affected disastrously in the Chicago district by the present coal strike, as a surplus stock of coal is always accumulated during the summer. The accumulation at present is somewhat larger than usual. The Inland Steel Co. and the By-products Coke Corp. ship the major portion of their supply by water during the summer, supplementing this stock by rail shipments during the winter. The Illinois Steel Co. receives its coal principally by rail, but uses Pocahontas, the field in which this is produced not being affected by the strike.

To all intents and purposes the steel strike is ended in the Chicago district.

Relight 54 Stacks In October

More Than Half of Furnaces Blown Out In September Have Resumed—Iron Production Drops But Large Gains Have Been Made in Past Few Weeks

ALTHOUGH the output of coke and anthracite pig iron in October was less than that produced in September, present conditions in the industry reveal that by the end of the present month production will be on a normal basis. Since the steel strike did not occur until late in September, production for that month was not seriously affected, so that it remained for October to show the greater part of the loss. At the same time, most of the improvement and recuperation took place during the latter part of that month and this gain will not be noticed until the November records are compiled.

MONTHLY PRODUCTION

	1919	1918	1917
January	3,306,279	2,403,227	3,159,839
February	2,947,555	2,318,242	2,649,935
March	3,088,023	3,209,996	3,255,813
April	2,474,374	3,273,355	3,328,061
May	2,107,729	3,451,884	3,413,677
June	2,114,028	3,316,148	3,260,234
Total 1st half.	16,037,988	17,972,852	19,067,559
July	2,424,212	3,408,584	3,337,442
August	2,742,081	3,378,479	3,238,970
September	2,480,790	3,413,223	3,140,742
October	1,978,218	3,482,392	3,296,286
Total 10 months	25,499,131	31,655,530	32,080,999
November	.....	3,347,844	3,198,597
December	.....	3,434,114	2,885,380
Total 2d half..	.....	20,464,636	19,097,417
Grand total..	25,499,131	38,437,488	38,164,976

Total production in October was 1,978,218 tons, a decrease of 502,572 tons from the September figure of 2,480,790 tons. On a daily basis, this total represents an output of 63,813 tons per day, an average 18,879 tons less than that of the previous month when the average was 82,692 tons. With this figure for daily production, October sets the lowest record since February, 1915, when the average was 59,521 tons. The loss in output over September represents a drop of 22.8 per cent compared to the fall of 6.5 per cent of September over August.

Nonmerchant or steel works stacks produced 1,393,283 tons compared to 1,891,418 tons during the previous month. This is a loss of 498,135 tons. These figures represent an average daily production of 44,944 tons for October and of 63,047 tons for September, the loss being 18,103 tons or 28.8 per cent. Merchant iron production totaled 564,697 tons compared to 567,608 tons in September, a decrease of 2911 tons. In average daily production these figures represented 18,216 tons for October and 18,920 tons for the preceding month. The loss, therefore, was only 704 tons or 3.72 per cent. September's merchant iron production was a decided improvement over that of August and the October output is well above the August figure. It is of significance to note that throughout the entire country, merchant furnaces, which were in blast during both September and October, showed increased production during the latter month.

Active stacks on Oct. 31, numbered 217 compared to 163 on the last day of September. This is a gain of 54 stacks. In other words, 54 or over half of the 103 stacks blown out on account of the strike in September, were relighted within a month. Of the 54 stacks placed in blast, 41 were steel works stacks. Sixteen merchant stacks were blown in and three blown out making a net gain of 13 stacks.

AVERAGE DAILY PRODUCTION

	1919	1918	1917	1916	1915
Jan.	106,654	77,523	101,930	102,319	51,323
Feb.	105,270	82,794	94,641	106,157	59,521
March	99,614	103,548	105,026	107,343	66,009
April	82,479	109,112	110,936	107,517	70,484
May	67,991	111,351	110,119	108,535	72,747
June	70,467	110,538	108,675	107,127	78,998
July	78,200	109,954	107,659	103,907	82,687
Aug.	88,453	108,983	104,483	103,156	89,510
Sept.	82,692	113,774	104,691	106,935	94,478
Oct.	63,813	112,335	106,332	113,167	100,656
Nov.	.....	111,595	106,620	110,593	101,174
Dec.	.....	110,602	93,077	102,715	103,278
Av.	84,301	105,293	104,562	106,610	81,022

No steel works stacks were blown out during October.

Spiegeleisen production increased from 155 tons in September to 5074 tons in October, a gain of 4919 tons. The output of ferro also increased, the October figure of 15,164 tons being an increase of 14,594 tons over the September figure of 570 tons.

Will Build Sheet Mill

While options on three different sites are held by the Superior Steel Co., Canton, O., for its new sheet mill, it is believed that the Canton site will have the preference. This company has been organized with a capital stock of $2,000,000 and is headed by Henry A. Roemer, former assistant general manager of the Canton Sheet Steel Co. Other incorporators include D. A. Williams, until a week ago general superintendent of the Canton Sheet Steel Co.; P. L. Howenstine, production manager, and Thomas H. Heacock, master mechanic of the same company.

The new plant will be electrically driven throughout and will embody the most improved equipment. It will include cold-rolling, annealing and galvanizing departments. When complete, its eight mills will have an output of 50,000 tons of sheet steel annually. While the company will do a general steel business, its chief products, initially, will be black and galvanized sheets.

Build Foundry for Motor Industry

In New Saginaw Plant a Systematic Arrangement of Equipment and Study of Factors Entering into Production Have Been Made to Obtain Large Tonnage of Duplicate Parts

IN A comparatively short time, motors and motor cars have become the principal product of Michigan industries. Immense plants have been erected in various parts of the state and in spite of their large output they cannot keep pace with the demand. Large foundries are operated in connection with nearly all of these plants.

One of the finest and most modern of these foundries has been built recently in Saginaw, Mich., at a cost of $3,000,000 for the Saginaw Products Co., a subsidiary of the General Motors Corp. The foundry was designed by Frank D. Chase, Inc., industrial engineers, Chicago, and built under their supervision. The property set aside for foundry use comprises 65 acres and the foundry which has been erected covers about one-third of that area. It is the intention of the company to eventually erect two similar units adjacent to the first and thus utilize the entire property.

The group of buildings, which forms a complete unit, consists of a foundry building, 165 x 490 feet; a coreroom, 101 x 390 feet; a cupola room, 60 x 80 feet; two cleaning rooms, one 40 x 165 feet, and the other 110 x 281 feet; an L-shaped boiler house, 87 x 93 feet; a pattern shop, 100 x 158 feet; and, a building, 80 x 280 feet, containing locker and bath rooms, a cafeteria and foundry office.

Steam Condensation Avoided

The buildings are of steel-frame construction, the walls of brick and concrete and the roof of gypsum tile. The latter is porous and eliminates all danger of steam condensing and dropping back to the floor in the shape of drops of water. An A-frame construction on the roof of the coreroom and also the cleaning room, and a modified Pond truss on the roof of the foundry together with an almost continuous window sash in the walls, insures an adequate supply of light on all the floors thus affording better working conditions.

The cupola installation and facing-sand mixing machinery occupy one end of the foundry building and the preliminary cleaning room the other, leaving an available foundry floor, 164 x 380 feet. This in turn is divided into four bays each 41 feet wide. A center aisle, 23 feet wide, extends an equal distance on each side of the center row of columns. The aisle serves as a roadway for the electric trucks which carry the cores to the molding floors and also as a dumping place for the castings before they are hauled away to the cleaning room. A pouring gangway, 9 feet wide, runs under the monorail which is mounted on the two outside rows of columns; while an aisle or gangway 17 feet 7 inches wide extends along each side next to the wall. The four molding floors are each 24 feet

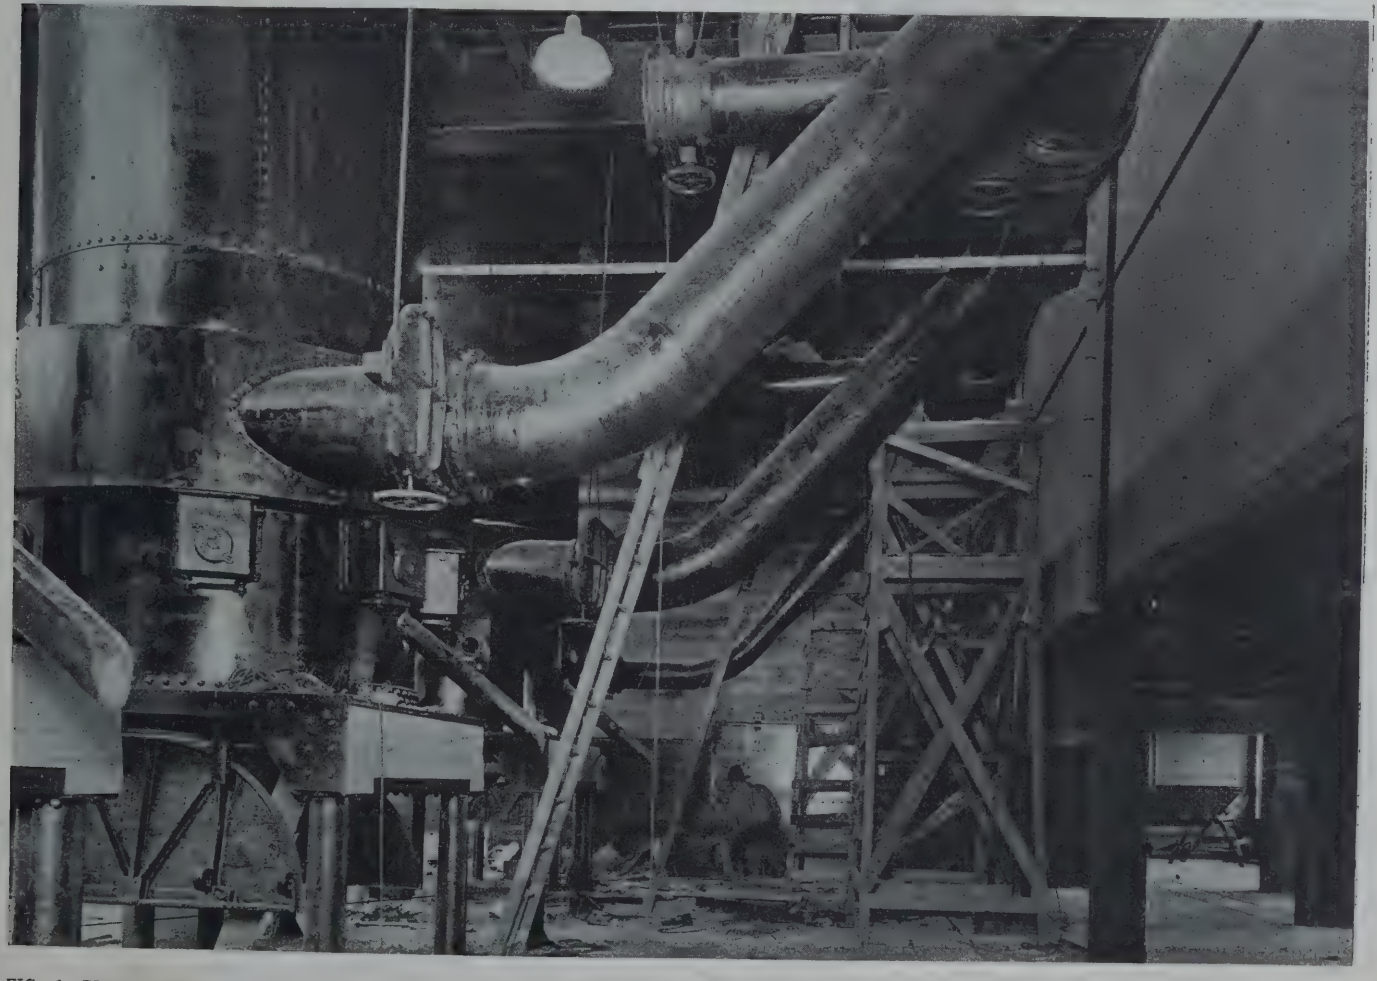

FIG. 1—BLAST GATES ARE PROVIDED IN THE HEADER BETWEEN EACH FURNACE AND ALSO NEAR THE JUNCTION OF EACH PIPE WITH THE WINDBOX

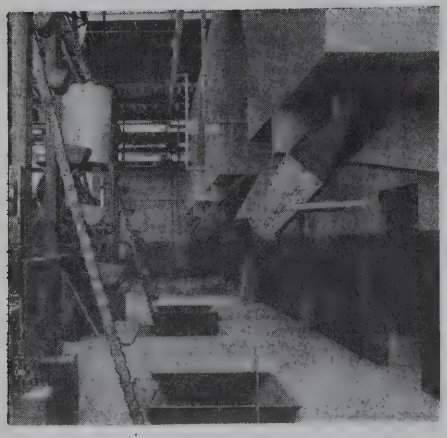

FIG. 2—HOPPERS AND CORE-SAND MIXING MACHINERY

wide and extend the full length of the interior of the building. These floors supply considerable room for mold makeup.

A 4-inch pipe line in the center and extending the full length of each floor has 2-inch connections at 8-foot intervals. Air, water and electric current connections are available at every other column. Two 3-ton cranes built by the Pawling & Harnischfeger Co., Milwaukee, and several 1-ton air hoists made by the W. W. Sly Mfg. Co., Cleveland, comprise the lifting equipment. The floors are laid with wooden blocks and the gangways paved with concrete.

When the foundry is placed in operation it is expected to furnish employment for 900 men and to produce 200 tons of cleaned castings daily. The melting equipment includes three 65-inch and one 40-inch cupolas built by the Whiting Foundry Equipment Co., Harvey, Ill., the blast for which is supplied by three positive-pressure blowers. The latter were built by P. H. & M. F. Roots Co., Connersville, Ind. Each blower is driven by an individual, 75-horsepower motor manufactured by the General Electric Co., Schenectady, N. Y. The three blowers discharge into a 36-inch header. The blast from the latter passes into the large cupolas through 26-inch pipes and into the small one through a 10-inch pipe.

Blast gates operated by a rack and pinion are situated between each furnace on the header and also on each pipe near its junction with the windbox. A 10-ton Pawling & Harnischfeger crane which has a 70-foot span and is equipped with a 62-inch magnet, lifts the iron from the yard to the charging floor. The gates, sprues and shop scrap are loaded in boxes and hoisted by means of an elevator to an upper charging floor, 12 feet above the first one.

FIG. 4—CORE OVENS WITH FAN FOR INDUCED DRAFT

Coke is stored in a room having a capacity of 1000 tons. This room is adjacent to and on a level with the main charging floor.

The machinery for mixing the facing sand is situated between the cupola room and the three storage bins each of which is 22 x 40 feet. It consists of two specially-designed revolving screens, two pan mixers, built by the National Engineering Co., Chicago, and two centrifugal sand mixers made by William Sellers & Co., Philadelphia.

The foundry is separated from the

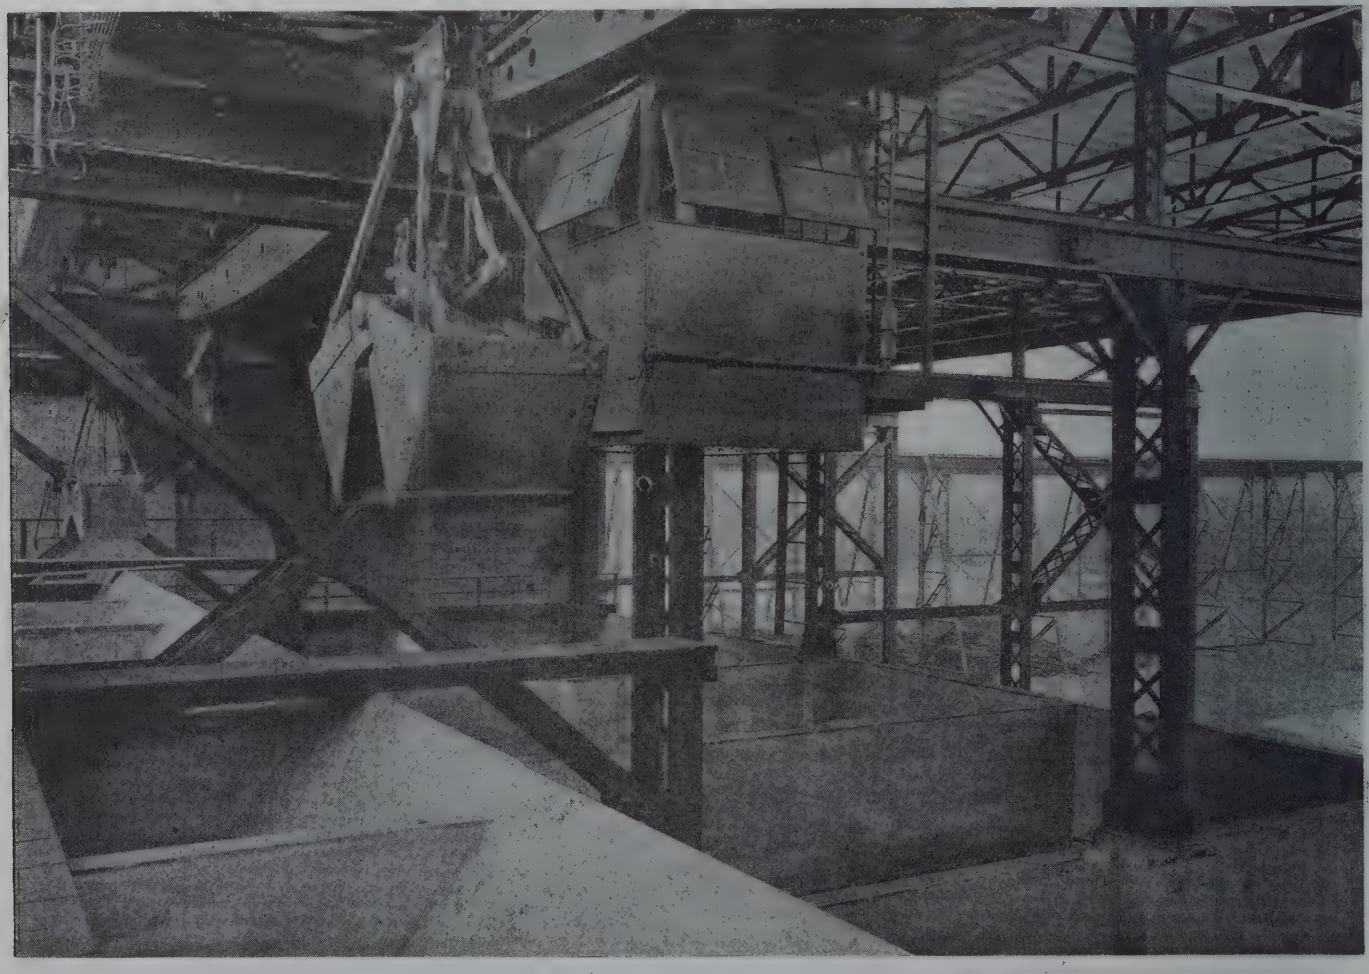

FIG. 3—CORE-SAND BINS WITH A COMBINED CAPACITY OF 8000 TONS. SAND IS HANDLED BY CRANE AND GRAB BUCKET

coreroom by a court, 40 feet wide, which facilitates the lighting of these buildings Core sand is stored in four bins located at the same end of the building as the molding-sand is kept. The bins have a combined capacity of 8000 tons. The sand is transferred from the cars by three 3-ton cranes. From the bins the core sand is removed by means of grab buckets and dropped into hoppers which lead to mixing machines in the coreroom. Two 27-foot mixers, which were built by the Standard Sand & Machine Co., Cleveland, and one manufactured by the National Engineering Co., Chicago, are used in preparing the core sand.

The 32 core ovens, each 6½ x 7 x 12 feet, were built by Holcroft & Co., Detroit. They are arranged in batteries of 16 and are built back to back in rows of eight to a side. The firing room is in the basement, both forced and induced draft being used to expedite the heating of the ovens. Provision has been made for doubling the number of ovens if necessary.

Two cleaning rooms have been provided. The first is intended for cylinders and other cored castings, and, is equipped with two sandblast units built by the Pangborn Corp., Hagerstown, Md. Four hopper-shaped openings in the floor lead to a moving belt which carries all the waste and burned sand outside the building. Here the sand is deposited in cars which in turn carry it to the dump. The second cleaning room contains 36 tumbling mills, built by the W. W. Sly Mfg. Co., Cleveland; one sandblast unit built by the Pangborn Corp., Hagerstown, Md., and, a surface grinder and 12 double-wheel grinders built by the Norton Co., Worcester, Mass. Individual dust pipes lead from each machine to mains, 42 and 36 inches in diameter respectively; the mains in turn, terminate in one twin and two-single dust arresters, each 40 feet long. Suction is supplied by two double exhausters, each driven by an individual 100-horsepower motor. A counting and a platform scale are used to record the weight of the castings on their way to the shipping platform on the west side of the cleaning room.

Electric current, which is supplied by outside interests, enters the plant at 2200 volts, 3-phase 60-cycle and is stepped down in two sets of transformers.

FIG. 5—CRANE RUNWAY AND STOCK YARD. THE CRANE HAS A SPAN OF 70 FEET AND OPERATES ON A TRACK 300 FEET LONG

Measuring Furnace Temperature

Solution of Pyrometer Problems Depends Upon Co-operation of Steelmaker, Scientific Man in Research Laboratory and the Instrument Maker — Intensity of Radiation is Governed by Many Factors

BY GEORGE K. BURGESS

THAT every steelmaker is convinced of the importance of adequately defining quantitatively the role of temperature in the various stages of steel manufacture is readily conceded. However, is it not also true that no steel manufacturer can state for liquid steel, other than in vague terms if at all, the relation of temperature at each stage of the process of melting, refining and casting, to any of the other factors influencing his product?

It was reserved to an American, E. F. Morse, to invent in 1902, the most convenient type of pyrometer for use in measuring the temperatures of liquid steel and other incandescent and inaccessible objects. This pyrometer has since been simplified and improved by others. The steel industry itself furnished the basis for this invention, which was an improvement of a method invented by Messrs. Taylor and White for use in controlling the temperature of certain hardening baths at the plant of the Bethlehem Steel Co.

Need Steelmaker, Scientist and Instrument Maker

In the portable form with tripod, or in that in which no tripod is required, the brightness of a small incandescent lamp at the focus of a telescope is matched in brightness against the incandescent background of the liquid steel or other hot object. The electric current taken by the lamp gives a measure of its temperature and thus also of the steel if certain very important conditions are also fulfilled. For the solution of problems of this kind, there is generally required the co-operation of the steelmaker, who best knows his problem; the scientific man in the research laboratory, who can bring the application of abstract principles and methods of measurement to bear on the problem; and the instrument maker who can put in concrete and sufficiently robust form the ideas of the scientific man that best meet the needs of practice.

As illustration of the role played by the research laboratory in this problem of temperatures of liquid steel, let us take the determination of the corrections to be applied to the optical pyrometer readings to give true readings. The need of such correction arises from the well known fact that the intensity of total and also of monochromatic radiation of any substance, not enclosed within a furnace uniformly heated, depends not alone upon its temperature but also upon the nature and character of the radiating surface. It then becomes necessary in the case of liquid iron, steel, oxides, and slags, to find their emissivity or specific radiation for the colored light used with the pyrometer. This can best be done in the research laboratory and not in the steel plant. This fact needs emphasizing as it has sometimes been said, the research laboratory of a steel plant should be the steel plant itself.

We spent considerable time in various steel plants trying to determine the radiation characteristics of liquid steel but with unsatisfactory results. The actual determinations were made in the laboratory with an instrument we have devised which is identical in principle with the optical pyrometer above mentioned except that it was a microscope instead of a telescope, and the masses of steel operated upon, instead of being 50 ton heats, were of the order of a few thousandths of a milligram. With the micropyrometer, as we call it, we were able to show that the emissivity of pure iron is 0.37 with light of wave length, $\lambda=0.65\ \mu$. In other words for red light used with the pyrometer, a free surface of iron radiates only 37 per cent of the same light from a furnace at the same temperature as the iron. Furthermore, this quantity ($e=0.37$), remains constant over the whole temperature range of steel manufacture and is not altered by the presence of any of the elements which may be present in steel and iron, and is also nearly identical with the emissivity of nickel and even, as very recent measurements show, of monel metal and other alloys of iron or nickel so long as they show no change in color caused by alloying. Similar measurements were made for iron oxides in liquid and solid states and of slags. It was then a simple matter to construct correction tables for the pyrometer when sighted on any of the substances. In steel manufacturing practice it was found advisable to adopt the value of 0.40 rather than 0.37 for iron and steel and the correction tables are based on the $e=0.40$ for $\lambda=0.65\ \mu$, for reasons explained in the United States bureau of standards *Technologic Paper* 91, published 1917.

The question of measuring accurately, most conveniently, and practically instantaneously, or to better than 5 degrees at 1500 degrees Cent. in intervals of 5 to 10 seconds, the temperature of running streams of liquid steel, as in tapping a furnace or teeming ingots, may be said to have been solved some time ago by the use of the optical pyrometer of the modified Morse type, to the readings of which corrections are to be applied based on $e=0.40$ for $\lambda=0.65\mu$ when sighting on iron or steel, with similar corrections for liquid iron oxide ($e=0.53$) and slags ($e=0.65$ or thereabouts depending somewhat on the nature of the slag). This does not mean that other pyrometers cannot be used successfully for this purpose, for they have been, including other types of optical pyrometer and various total radiation instruments.

It has been demonstrated also that the arch or dome of an open-hearth furnace may be watched and its temperature controlled by the same pyrometer, although here no corrections appear to be necessary to the observed temperatures.

Similarly, the temperature of the surface of the slag in an electric or open-hearth furnace may be observed through peep holes with doors shut if care is taken to avoid flames and smoke; and the progress of the heat as related to slag temperatures may be followed with considerable accuracy at least for open hearth furnaces.

Temperatures of Metal Bath

The most difficult and most important problem is to determine, for any instant of time and condition of bath, the temperature of the metal bath itself. There is, perhaps, some comfort in appreciating that, in general, this difficulty is offset in part by the fact of non-uniformity of temperature within the metal unless the bath is well and frequently stirred. These differences within the bath, as have been shown from a series of observations of tapping temperatures, may reach under certain methods of operating, 200 degrees Fahr. or more and are evidently within the control of the melter.

Considering the apparently crude

From a paper presented at the sixteenth general meeting of the American Iron and Steel Institute, New York, Oct. 24. The author, George K. Burgess, is chief of division of metallurgy, United States bureau of standards, Washington, D. C.

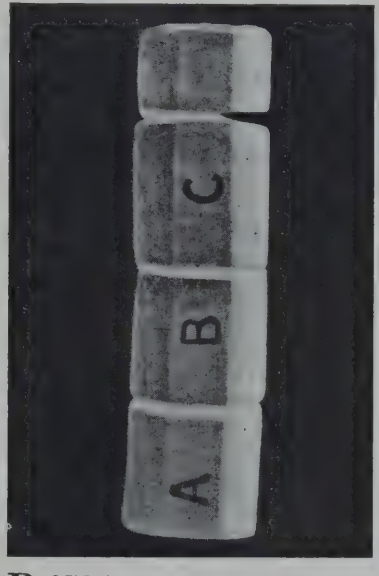
methods in use, it is a source of wonder to anyone who has had occasion to check the temperatures of steel, as cast, to note the marvelous uniformity attained from one heat to another by the furnace men. For example, the method of timing the appearance of crust in the chill test as often used appears to have no necessary relation to the bath temperature; nevertheless, this remarkable uniformity in casting temperatures extends over the whole steel industry in this country.

The question of following electric furnace temperatures is complicated by the presence of the electrodes but the practice of changing slags gives opportunity for intermittent temperature observations of a satisfactory nature by various methods as shown by Mr. Bash in a paper presented at the recent meeting of the American Institute of Mining and Metallurgical Engineers, Chicago. The technique of electric furnace temperatures, however, needs considerable additional study. From a comparison of casting temperatures of several electric and open-hearth furnaces in normal operations Mr. Bash concludes that electric furnaces are not tapped at higher temperatures than are open-hearth furnaces, as is often held.

It would appear that, heretofore, most of the determinations of furnace temperatures have been made by representatives of the research laboratory or instrument maker, and nearly all the published observations were so taken, although there is undoubtedly in existence considerable data and experience accumulated by steelmakers themselves. It is evident that discontinuous observations taken somewhat casually by outside parties, although they may serve excellently for demonstration purposes, can nevertheless by no means replace the continuously carried out observations made by representatives of the steelmaker himself over long periods of time and under the incessantly changing conditions of practice. In this way alone can the problems of temperature conditions, control and interpretation be solved in the interest of steelmakers.

Producing Multiple Ingots for Tires

BY GUILLIAEM AERTSEN



INDIVIDUAL ingots were used for tires by the first tire maker in this country in 1867 and the practice was almost universal for about 30 years thereafter, the principal exception being that of a tire maker who did not make his own steel, but bought long ingots from steelmakers, cut them into blocks at a steam hammer and afterwards proceeded as described by Mr. Fry.

Until about the year 1900 the majority of tires made in this country were made from individual ingots, and these ingots were cast in a great variety of molds. Many types were used, including top cast, bottom cast, open top, closed top, with and without head boxes, sink heads, etc., in a constant effort to improve quality and avoid the difficulties and dangers which beset attempts to cast a large number of small ingots of exact weights from the same open-hearth heat.

The adoption of multiple ingots was postponed because of the expense for equipment and of the extra cost of manufacture. It was the concensus of opinion among tire makers that the cheaper individual ingot was probably good enough. Little, if any, trouble was ever traceable to pipe, either eliminated by the punching or concentrated near the bore of the tire where it was never exposed by wear, but it was never contended that the multiple ingot, from which the piped and defective top was fully cropped and discarded, was not better.

Thus the use of individual ingots remained standard practice until about the year 1896, when bottom poured multiple ingots began to be adopted and are still used with hot tops or refractory head boxes, in which it is common practice to cover the top of the freshly poured metal with material similar to what Mr. Fry describes as pipe eliminator.

Multiple Tire Ingot

BOTTOM-POURED, flat sided octagon ingot which has been sliced hot in blocks A, B and C, each of which will make one tire. The unlettered section is the discard necessary to do away with piping and segregation.—From paper presented by LAWFORD H. FRY.

Mr. Fry shows a variation in analyses at different points of the same ingot which would not be expected nor accepted in blocks cut from a multiple ingot. In both, the punching removes a small problematical part of the center of the ingot where pipe and segregation may be expected. This punched-out piece, about 6 to 10 inches in diameter by 1 or 2 inches thick, is not produced until the ingot or block has been upset and its diameter increased about 50 per cent. With this exception, in the individual ingot all the pipe and top surface defects remain in the resultant bloom and tire. There they are, regardless of whether or not they are harmful. In the multiple ingot, the pipe and top surface defects are discarded at the beginning.

Mr. Fry refers incidentally to the use of multiple ingots of large cross section, approximately 4 square feet, rolled to from 12 to 14 inches in diameter, then sliced into slugs or blocks, upset and punched. These have been used for rolled wheels, but not, so far as the writer knows, for tires. It would be of interest to know the effect of this method upon the physical properties of tires, remembering that in a tire the strain is transverse to the longitudinal axis of the ingot and of the bar or billet rolled therefrom.

The open-hearth pit organization responsible for the operation which Mr. Fry describes cannot be too highly complimented. Its accomplishment is to be appreciated only by those who have struggled with similar problems. To regularly and successfully get from 80 to 100 "shut-offs" from each of two nozzles in the same ladle, one keeping step with the other, is a feat.

The blast furnace of the Cranberry Furnace Co., Johnson City, Tenn., which has been out of blast for repairs, now is ready to operate, and is expected to go in blast probably by the middle of this month.

A discussion of the paper entitled, "Manufacture of Ingots for Locomotive Tires and Rolled Wheels," by Lawford H. Fry, presented at the sixteenth general meeting of the American Iron and Steel institute, New York, Oct. 24. The author, Guilliaem Aertsen, is assistant to vice president, Midvale Steel & Ordnance Co., Philadelphia.

What is Future of Open-Hearth?

Opportunity for Development of Furnace and Steelmaking Processes Exists in Design and Construction of Equipment and in Every Phase of Operation — Present Methods Should be Compared

BY HENRY M. HOWE

IN SPITE of the rapid strides made in the development of the open-hearth furnace and steelmaking processes, there are numerous opportunities for further improvements. In many cases, where existing practice is known to be faulty, the conditions affecting it should be studied with a view of correcting the defects. In other instances, particularly where doubt exists as to which of two or more methods is most satisfactory, extensive research should be inaugurated to determine what plan should be followed.

Taking up the furnace construction, we may ask our mechanical engineers whether they cannot design the tilting furnace so as to reduce the cost of its upkeep till it no longer is a serious consideration in deciding between the tilting and the stationary furnace. And we should discuss the real saving in time and the other advantages of tilting and the conditions under which it is most useful.

The efficiency of the open-hearth furnace depends in large part on that of the regenerators regarded as heat filters. The present ones seem very crude, having for instance, about the same construction in their upper as in their lower parts, though the heat conditions differ so enormously from top to bottom. We may well ask whether the passages should not be larger above, where the gases are so greatly expanded, than below. Further, whether the bricks themselves may not be improved. They catch and emit the heat at their surfaces only, but store it in their interiors. Hence, their surfaces should be extensive and their material should transmit heat readily from surface to interior and back. This transfer calls for a dense, and perhaps even a semi-glazed state. A hard brick of great conductivity, even if too fusible for the upper part of the checkers, might well be used in the lower part. Again, the extent of surface might be increased by making the bricks very thin and by ribbing their sides with vertical ribs that would not catch the dust.

The efficiency of the furnace depends further on the accurate retention of the shape of certain parts, for instance, the ports and valves. It may be well to inquire carefully in what parts of the furnace the advantage of accurate retention of shape by means of water cooling outweighs the loss of heat involved. For moving the incoming and escaping gases, how does the profit from using fans compare with the cost of their installation and operation? Their use thus far is promising. I introduced them for both purposes in 1874.

We may ask what the useful limit of size of the furnace itself is, the limit where the disadvantages of irregularity of temperature and composition and of excessively great units for soaking and rolling outweigh the advantage of saving of fuel, labor, and installation per unit of product. This limiting size will be greater for quantity than for quality practice.

How should the pitch of the ports be related to the length of the furnace, to the kind of fuel, and to the stock? Flatter ports might be needed for charges rich in scrap, which have to be protected from oxidation during melting, than for molten pig iron which has to be oxidized vigorously.

How deep should the bath be at its deepest point so that it may work as fast as is consistent with thorough control, and that the economy of large charges may be gained?

Turning now to the open-hearth process itself, we find many matters pressing for attention. Perhaps the greatest need is to impress on operators the extreme importance of controlling the composition of the slag, and especially of lowering its iron oxide. Precise maxima of iron oxide premissable for various processes and grades of steel should be established, and should be incorporated in all important contracts, quite as rigorously as the permissable sulphur and phosphorus contents of the steel itself.

The methods of lessening the quantity and harmfulness of inclusions need great improvement. Two essentials seem to be: First, ample time for the inclusions to rise by gravity in furnace, ladle, and perhaps mold; and second, fusibility of the oxides formed by the final deoxidizing additions, so that they may readily coalesce into particles large enough to rise rapidly. As a step toward this last we should determine systematically the melting points of the combinations of oxides which it is practicable to form with these additions.

The quiet which results from thorough deoxidation of metal and slag may be held to have two simultaneous but opposite effects. It facilitates the rising of inclusions of given size, but it does not favor the coalescence of particles into masses large enough to rise fast, as rapid movement does. Witness churning for butter.

How far is the objection to the use of ore justified? We object reasonable to the use of rusty scrap because of the irregularity in the quantity of oxygen which this causes. In treating charges containing any considerable quantity of pig, much oxidation has to be done. Some very competent men would have this done wholly by the furnace gases and object to the use of ore, apparently on the ground that the resulting local over-oxidation is not readily overcome. They would have the oxidation superficial, brought about by the slag rather than by iron ore submerged in the bath itself. The evidence should be examined with care. We should not be led away by unsupported theories, however plausible. Certainly the excellence of the acid open-hearth steel made with moderate use of ore

New Technical Series

A FEW years ago a general paper on the blast furnace was presented at a meeting of the American Iron and Steel institute. It was followed by many papers each dealing with some specific phase of blast furnace practice or construction. According to Dr. Howe, these collectively form the most comprehensive and probably the most valuable treatise ever written on this subject.

The institute proposes a similar treatment of the open-hearth furnace and steelmaking processes. With the aid of Messrs. Walker and Gray, Dr. Howe has outlined the probable course of development in the accompanying article, which is from the paper presented at the sixteenth general meeting of the institute, New York, Oct. 24. The first paper of the open-hearth series, by Lawford H. Fry, appeared in last week's issue of THE IRON TRADE REVIEW.

sets up something of a prima facie case for oring.

Should residual manganese be insisted on in making fine steel, and in general that on which human life depends? The demand for it rests on the belief that oxidation by means of manganese, acting as a carrier of oxygen, is beneficial in that it does not lead even to the temporary formation of iron oxide within the metal. This should be tested more thoroughly. If true, then the benefit of this treatment should cause some special merit in the product in the way of a specially high combination, for instance of elastic limit and ductility or shock resistance, and the specifications might be amended so as to reject steels which lack it. I refer, of course, to steels for important purposes, failure in which would endanger life.

The relative merits of the basic and acid open-hearth processes should be established more firmly. The comparison should be made between the two as practiced under truly comparable conditions, for instance with nearly equal strength of deoxidizing conditions, and not between basic with 80 per cent of pig iron and acid with only 25 per cent.

The advantages of the dominant pool of the Talbot process should be evaluated, so that they may be weighed against the disadvantage of having to make the steel in the ladle. Do we really gain enough time by leaving part of the charge in the furnace to overcome the objection to ladle steelmaking, with its irregularity of composition?

Is Low Casting Temperature Preferable?

We should satisfy ourselves that our American practice of using a low casting temperature for fine steel instead of the high temperature used in continental Europe is right, and ask searchingly whether its advantages of giving freedom from surface cracks and of restraining both axial segregation and the coarseness of the columnar crystallization really outweigh its disadvantage of giving less opportunity for the inclusions to escape in the ladle.

The relative advantages of limestone and lime should be weighed. Limestone is a cheaper material than ore for bringing on a boil, and with it we avoid introducing iron oxide into the molten metal as ore does, thus substituting superficial or slag oxidation for internal or submerged oxidation by the immersed ore. On the other hand, it is derided as using the costly heat of the open-hearth to do the work of the cheap heat of the lime-kiln. How does the extra cost of this heat compare with the alleged advantages?

Turning now to the compound processes, included the duplex, triplex, Bertrand Thiel and others, we may divide each into a roughing and a finishing phase. The chief reason for their existence is to separate the silica formed by the oxidation of the silicon of the pig iron from at least the last part of the dephosphorization and desulphurization. Hence they seem applicable primarily when an abundant pig iron needing dephosphorization or desulphurization is to be treated.

Among their additional advantages are: *First,* their power of concentrating the phosphoric acid in a relatively small quantity of slag, which may be useful as a fertilizer even when the stock contains relatively little phosphorus; *second,* their use for making alloy steels directly and relatively cheaply from molten open-hearth or conceivably bessemer metal; and *third,* their improving the quality of molten blown bessemer metal by treating it directly and cheaply in the open-hearth or electric furnace, thus getting part of the cheapness and rapidity of the bessemer process together with a quality at least approaching that of open-hearth steel.

These advantages are to be weighed against the inevitable serious loss of heat in transferring from one furnace to another, and the total loss of the initial manganese in the roughing phase, compelling us to replace it in the finishing phase if we are to have the benefit of residual manganese.

For the roughing phase the bessemer converter, both acid and basic, the basic open-hearth, and the basic lined mixer are applicable; for the finishing phase, the basic open-hearth and the basic electric furnace.

Here we should study the relative advantages of the three roughing furnaces. In using the bessemer process for roughing we usually blow about two-thirds of the pig iron very full and the remaining third, or "kicker," only half way, to the end that the carbon left in the kicker, about 1.75 per cent, may react vigorously on the iron oxide stored up in the full-blown metal, and bring on a boil. This full blowing wastes iron, time, and steam, so that the resulting oxide is extremely expensive. We should satisfy ourselves whether its convenience justifies its use in place of iron ore or scale. Beyond this costliness, we may ask whether here, as in bessemer practice in general, we do not sacrifice quality unduly to the convenience of having a clear signal for ending the blow, remembering how the Swedish bessemer steel caught on the way down compares in reputation with our full-blown product.

We should ask further how far the damage to quality due to bessemerizing is remedied in the finishing process, and how this finishing must be done to make this remedy effective. If this damage represents simply imperfect deoxidation of the iron and imperfect removal of inclusions, the general direction of the remedy seems clear. Of the two other roughing furnaces, the basic open-hearth seems to commend itself best when the pig iron contains relatively little silicon, and the mixed when it contains much, because of the greater trouble which silica gives in the open-hearth than in the mixer. We should seek a clearer definition of the conditions appropriate to each of these two furnaces, and should ask what advantages the open-hearth has over the mixed to compensate for its higher operating cost, due to its smaller scale of working and its more intricate construction.

Again we should ask how far it may be possible to reduce the disadvantage of the bessemer, its loss of iron, while retaining its advantage of rapidity and cheapness, and thus to invade with it the field now occupied by the basic open-hearth furnace and mixer as roughing tools.

To Study Iron Deposits

It is announced by the department of industry, commerce and labor of the Mexican government that especial attention is to be given to the development of the iron ore resources of the country. With this purpose in view Luis G. Espinosa, chief of the bureau of mines of that department has been directed to make a complete survey of the iron ore deposits, particularly of the west coast region, and to make recommendations as to the available localities for the establishment of iron and steel plants. It has long been known that one of the largest iron ore bodies so far discovered in Mexico is situated on the Pacific coast, not far from the port of Acapulco, in the state of Guerrero. It is stated that this mountain of iron towers to some height on the very verge of the Pacific ocean and that its ore could be easily mined and placed upon ships. Another large bed of iron ore is situated in the state of Jalisco and has been operated in a small way for many years. It is from the famous Iron Mountain, situated on the outskirts of the city of Durango, in the state of Durango, that the Monterey Iron and Steel Co. for several years past has been obtaining much of its ore supply for its plant at Monterey. The company owns also beds of iron ore in the states of Tamaulipas and Coahuila, situated near the Rio Grande. It is planned by the government authorities to encourage the development of the coal deposits of the country and the manufacture of coke, along with the building up of the iron and steel industry, it is stated.

Belgians Spurn German Offers

Cockerill Company Needs $13,000,000 Worth of Equipment, but Declares it Will Never Make Purchases from the Despoiler—Three Years Needed to Get Great Iron and Steel Plant into Normal Production

BY FRANCIS MILTOUN
French Correspondent of The Iron Trade Review

PERHAPS the most beautiful river valley of Europe is that of the Meuse as it courses down from its cradle in the mountains of the Vosges through the French and Belgian Ardennes. For its entire length through Belgium it also is one of the most industrial, work-a-day rivers of all the world, although navigable only for barges and canal boats coming from the waterways tributary thereto.

The crown gem of this diadem of riches is that district along the river 50 miles in either direction from Liege. Five great steel works with all their accessory industries shoot their great stacks into the air. It is comparable only to Pittsburgh, the Allegheny and Monongahela. Of all of these plants the largest and most famous is that of the Société John Cockerill, at Seraing, founded by a Scotchman, the son of an immigrant who in 1817 acquired from the king of Holland, then the possessor, the ancient chateau of the Prince-Bishops of Liege. The same edifice is today the administrative building, and the residence of the director-general, M. Leon Greiner, who controls the destinies of this great industrial enterprise, together with its branch plants and *comptoirs* throughout the world.

John Cockerill died in 1840, and a new company was formed under the control of M. Gustave Pastor, a nephew of the founder. Great developments have occurred since then, among them the establishment of a shipbuilding yard at Hoboken, on the Scheldt, above Antwerp, the purchase of a part of the Esperence coal mining property and of the mineral deposits at Somorrosto, and various other mining concessions in the neighboring grand duchy of Luxemburg and in the French department of Meurthe et Moselle. A new forge plant was established in 1885, and a modernized steel plant and an armament plant were built in 1906. More recently a tube mill was established at Sclessin, near Liege.

The area covered by the Seraing plant at the beginning of the war was over 370 acres, of which 105 were under cover. Seraing is a city of 40,000 inhabitants, a few miles below Liege, the metropolis of the region, on the banks of the Meuse.

LEON GREINER

THE director-general of the Societe John Cockerill, Seraing, Belgium, is a "working director," being described by THE IRON TRADE REVIEW'S *Paris correspondent as the most active force in the administrative and operating departments of the organization.*

"In the old palace of the prince-bishops of Liege are installed the offices of the great Cockerill establishment, one of the largest of the European steel plants," writes the correspondent. "In the old Episcopal palace, too, is installed the residence of the director general. He lives and works in the halls where once sat in royal robes of purple the prince-bishops, governors of the province, in the middle ages. He has an overseeing eye and hand on all the ramifications of this plant which is not only contiguous to the administration building, but spreads out afar, to the ship yards on tidewater and the ore fields across the French border."

The Cockerill plant was one of the first prizes of war coveted by the Germans as they marched on the forts of Liege in August, 1914. The plant was a dangerous rival of the great German industries in the valley of the Ruhr, and the Germans sought it especially to increase their resources in the event the war was prolonged. For this reason they came through quickly in this direction, and at awful cost. The object was to ruin as much Belgian competitive industry as possible, and to make use of its equipment and resources. They swept down upon the smiling, smoke-plumed valley of the Belgian Meuse and succeeded only too well in their work of devastation.

It is estimated by the directors of the Cockerill organization that the number of machines and various parts of equipment either destroyed or stolen was so large that it will be at least three years before a normal regime of labor and production will be possible.

The policy of the Cockerill company is to buy nothing from Germany that might be needed, notwithstanding attractive prices German manufacturers are already making, and the advantage of buying German machines at the present debased price of the German mark. The organization prefers to rebuild with its own resources, or by acquiring equipment elsewhere as it might be found, but it is declared that Germany will never have a cent of profit from the establishment. It might mean that the company will be handicapped for years, but it is prepared to accept these conditions rather than call upon Germany for anything, except the return of stolen machinery, identified by the Belgian reconstitution committee.

The plant at Seraing was bereft of everything which could be used in production after the German retreat. Today certain furnaces, less damaged than others, are being put into order. Generators and machines are being repaired for use until such time as the plant can be outfitted anew.

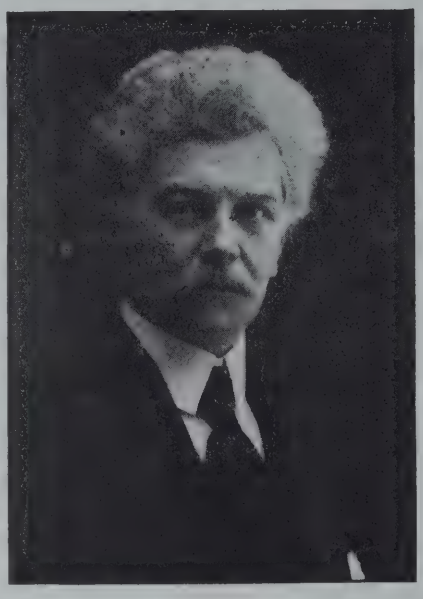
Cockerill workmen had tempting offers from Germany during the occupation to go across the border to German steel mills. Some of them did so, but

This is the third article of a series describing the iron and steel industry of Belgium and its reconstruction plans, written by THE IRON TRADE REVIEW'S Paris correspondent.

"COURAGE TO THE LAST," THE MOTTO ON THE COCKERILL COAT-OF-ARMS, FITTINGLY DESCRIBES THE SPIRIT OF THE GREAT BELGIAN IRON AND STEEL COMPANY IN RECUPERATING FROM THE BLOW DEALT ITS PLANT BY THE GERMANS. A NUMBER OF MACHINES STOLEN FROM THE COCKERILL PLANT HAVE BEEN IDENTIFIED AT THE GERMAN ARSENAL AT SPANDAU

by far the greater number disappeared in other ways during the war. The company now is only beginning to recruit an adequate staff for preliminary needs, which to a large extent consist of clearing away debris and rebuilding as much as possible on the old foundations. The value of equipment lacking is estimated at 65,000,000 francs ($13,000,000) based on valuation before the war. Today it would cost double, or triple in many instances to replace. One thousand machine tools of all sorts were dismounted and transported to Germany. All the portable parts of blast furnaces, converters and coke ovens were also removed. What the Germans did not take away they destroyed. Nothing remained of this vast and well-equipped plant but what was broken into bits. Rolling mills and their foundations were scrapped, gas generators were dismounted and parts taken away. The electric installations without exception were removed, and the considerable rolling stock, locomotives and freight cars went the same way, as did kilometers of laid rails, 65 gantry cranes and 40 turntables. For more than four years the immense halls and *hangars* were as silent as the tomb. At present there is a semblance of the former activity, and 2000 workmen are employed throughout the plant in laying down the lines of new production. The number is expected to be increased to 5000 by the end of the year. In the great German arsenal at Spandau, which turned out many of the famous "77" cannon, a number of the Cockerill machines have been identified and some have even been brought back and set up on their old emplacements. The first blast furnace was relighted in mid-summer and others are planned for productive service before the end of the year. A view of the Cockerill plant, "stripped bare to the bone," gives weight to the words of President Wilson, spoken on his voyage to Belgium, just before he sailed to America. He said:

"The tasks of Belgium are the tasks which are incumbent upon its people. They depend largely upon Belgium getting a priority in the acquisition of raw material and the plant necessary to again get into productiveness. Shipping is also a great question upon which depends the prosperity of the Belgium of the future. Ship masters can do no better than to steer their ships toward Belgian ports."



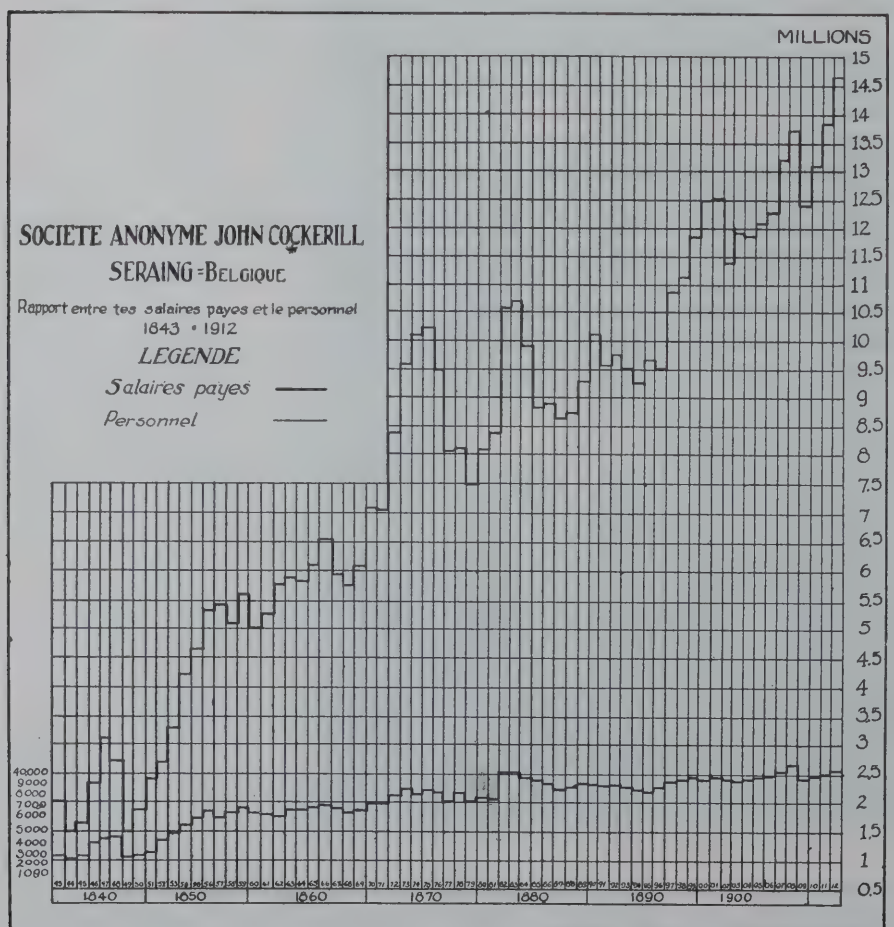
The Société Cockerill has played an important part in the prosperity of the town of Seraing, where in the public square is a magnificent monument to the founder of the enterprise. The wages and salaries it paid out each week were enormous, as shown by the accompanying chart, which shows that up to two years before

Summarizes Belgium's Industrial Progress

ECONOMIC conditions in Belgium were summarized by Monsieur Jaspar, minister of economic affairs, during a discussion of the budget in the Belgian parliament.

"The country's coal mines are already in production to the extent of 86.8 per cent of that before the war," he said, in felicitating the country on superb effort made to re-establish industries. "This is due to employers of labor and to labor alike.

"Coke furnaces are producing 43 per cent of the output of before the war. Unemployed labor has decreased from 800,000 in February, 1919 to 200,000. Our general exports are but 25 per cent of what they were before the war, but whereas it is estimated that Europe as a whole is producing but 35 per cent of its prewar output of necessities, Belgium's production is in no way behind this figure, and it is improving day by day. Belgium has earned the admiration of all strangers who may have crossed its frontiers since the armistice.



MONSIEUR JASPAR
Belgian minister of economic affairs

"Monsieur Hoover, from the United States, and Monsieur Loucher, the French minister of reconstruction, alike have expressed themselves in wonder at the magnificent effort which we have made and which we must continue to make, one and all, employers and laborers, without exception.

"Belgium may well have confidence in the future. By her own effort she is now to come to her own again and this in spite of many seemingly insuperable difficulties. Her future should be more brilliant than ever, more prosperous even than in the past."

the war wages reached a total of nearly 15,000,000 francs ($3,000,000) and salaries 2,500,000 francs ($500,000). The company maintains an industrial college in Seraing, and also contributes to the maintenance of the naval school at Hoboken. Other educational and technical institutions have much to thank the company for, notably the mining school of Seraing, and the polyglotte circle, intended to give its employes a knowledge of various languages. Various scholarships are endowed from the Cockerill fund which was given by Henri Cockerill, of Aix la Chapelle, a nephew of the founder of the plant, and by the Greiner fund, established by Adolphe Greiner, the father of Leon, on the twenty-fifth anniversary of his taking the helm as director general of the company. A hospital and alms house at Seraing also receive assistance from the company.

A savings bank founded by the company had to the credit of its employes in 1912 over 7,500,000 francs ($1,500,000). The company has given many millions to its pensioned workmen. Mine workers are entitled to a pension at the age of 60 years and other workmen at the age of 65.

STEADY PROGRESSION OF THE SOCIETE JOHN COCKERILL IS SHOWN BY THE COMPANY'S CHART OF WAGES AND PERSONNEL

Steel Links for Stokers

Ordinary cast iron links in chain-gate stokers were found to be comparatively short lived, some 3000 to 4000 hours, on account of the inferior dry coal available during the war, according to *Zeitschrift für das gesamte Turbinenwesen.* Experiments were made with links of rolled steel. These soon

proved superior, as they did not break, or expand sufficiently to obstruct the air spaces between the links. Upon examination after 7800 working hours they were found in a satisfactory condition. It was also found possible to use driving links ¾-inch thick only, which permitted a more uniform fire and decreased the weight of the grate.

The fire-bridge and dumping bars at the end of the chain grate were found to deteriorate quickly, and recourse was had to water-cooled metal fire bridges, together with dumping bars suspended as pendulums and provided with air spaces and cooling ribs.

Air is Preheated

The air entering at this point is heated by passing over the ashes, and assists combustion without damaging the pendulum bars. It is possible to utilize the grate as far as the pendulum bars, which is not the case with ordinary dumping bars. Consequently less skill is required by the attendants and a fuller use is made of the grate surface, resulting in greater efficiency as evidenced by a higher percentage of carbon dioxide in the flue-gases.

It has been found economical to fit adjustable forced draft under the chain grates as a saving of 15 per cent in coal consumption was thereby obtained in continuous working. The draft is regulated automatically by the steam acting on a gage tube, and the boiler pressure remains constant to within 1½ to 3 pounds even when burning ordinary small coal mixed with 30 per cent of coke breeze.

Outline Americanization in Industry

AN INTERESTING symposium on Americanization, its methods and its meaning to industry, was presented at the eighth annual congress of the National Safety council, Cleveland, Oct. 3.

"Industry occupies a strategic position relative to the foreign-born," said H. T. Waller, formerly educational director, B. F. Goodrich Co., Akron, O. "Industry has needed the man with the pick and shovel, the man with brawn, the man eager to make good, the man willing to work under all conditions and at all times. The industrial progress of this nation has its foundation built by the supply of immigrant labor. Industry, however, during the later years has come to recognize a much greater potential force in its unskilled labor than heretofore. It has come to recognize a terrific loss due to misunderstanding; it has realized also that only as understanding is created between employe and employer can best results be secured.

"Industry can and should supply within its organization a person or persons charged with definite responsibility for developing the best interests of the foreign-speaking employes in the plant No outside agency can come in and do what this agency from within can do. It is necessary that industry shall stick to its job of production and any work that is done must be so conducted as not to interfere with production, but this has a vital influence upon production. Therefore, find a man or men with high purpose, social vision, and practical common sense, who will work together with the foreman, assistant foreman, and American workers of industry. The result will be an established point of contact with the foreigner that is bound to be of tremendous value.

"The men responsible for Americanization in industry must be men of community vision, not men who are simply creating a department and a job for themselves.

"When it comes to the question of instruction of the employes in the knowledge of English, the ideal is the educational leadership of the community, namely, the board of education and the point of coupling the public educational forces to the industrial power is a delicate one and calls for splendid leadership on both sides.

"Industry can do more for the promotion of Americanization than any other single agency. In fact, industry must do more, for it is to the best interests of industry that it should be done. The type of community in which a man lives determines more than we now realize the type of production that he turns out. There is, therefore, a compelling economic force which determines industry's place in this great problem."

Hans Rieg, chief of the foreign language division, United States treasury department, said:

"Any government which will attempt to nationalize its subjects of various racial origins by forcible or arbitrary method will ultimately come to harm. This is not idle theory, but established historical fact.

"There are in the United States of America more than 15,000,000 born in foreign countries; over 14,000,000 more are the children of foreign born. Of these 29,000,000, more than 50 per cent speak and read either exclusively or preferably the tongue of the country of their origin. In the aggregate, they converse in at least 47 different tongues. They read 1394 publications printed in 35 different languages. The combined circulation of these publications is about 14,000,000, and more than 8,000,000 individuals read nothing else, because they can't.

"All the sources of Americanization, with their 57 varieties, lacking centralization and co-ordination, beget duplication, wasted energy and scattered effort. I am of the firm conviction that headway can be made only if we centralize plans of Americanization under United States government control and supervision, backed up by proper, special, and badly needed legislation.

"We can then get the effective cooperation of state and municipal authorities together with that absolute essential, co-operation of nationality and racial group leaders, such as pastors, priests, and presidents of existing organizations among our foreign-born.

"To become a citizen of the United States and a full-fledged member of our nation, is the fundamental, though often dormant, desire of almost every foreigner in our midst. The thing to do is to arouse and to intensify this desire to such extent that the individual of his or her own account will seek the opportunities to fulfill this desire. Don't drive them, beckon to them, and lead them!

"Don't expect them to change habit and character, language and custom, from the day unto the morrow, and bear in mind, that he can be a very good and most desirable American who will still retain a heart interest in his native land, his mother tongue, and the interests of his ancestry, relatives, childhood memories and racial dispositions.

"Americanism is not a mere matter of habit, dress or language but of sentiment and heart. Advocate the possession, through earning power of mental or physical effort, of land or improved property, of a home and the attractions that accompany it. Advocate the partnership, formed by being owners of securities in the United States, be they governmental or private. The more the foreigner puts into the United States, the more he will soon realize he gets out of it. The longer and the more he applies his energies to his own selfish pursuits, the deeper grows his interest, with the result that he becomes naturally subservient to exact and proper suggestions not only to be permanently of our country, but as much as possible of our kind."

"Americanization of the immigrant involves merely the application to him of the principles of American democracy," said Allen T. Burns, of Study of Methods of Americanization, New York.

"He should have these things which we also want, and to this end he should be invited to participate in his own Americanization. If this succeeds, it means that democracy is still a practical working scheme of social organization and control. It means that what we succeed in doing for the Americanization of the immigrant will at the same time constitute a contribution to democracy. If it fails it means that so far as the immigrant is concerned democracy is no longer a practical social and political device."

German Machine Tool Prices Low

While Keen Competition From Germany is Faced by American Manufacturers in French, Italian, Holland and Switzerland Markets, in Many Cases Superiority of Design and Workmanship Assure Sales

BY ALEXANDER LUCHARS

PARIS, France, Sept. 8.—When the contract was signed recently by the American liquidation commission to sell for $400,000,000 to the French government about three-quarters of the war material in France belonging to the United States government, an important transaction was completed. The material sold, which cost about $1,300,000,000, included all the machine tools which had been sent to France by the United States war department, besides enormous quantities of all kinds of machinery and supplies.

As is usually the case, dealers and others interested, differ widely in their estimates of the value and amount of the machine tools, placing the value at 100,000,000 to 400,000,000 francs. (The French franc, now selling at about 12.5 cents United States currency, normally is worth 19.3 cents.)

Some of these tools now are being sold by the French government to manufacturers in the devastated areas, and some are being used for adjustments in government plants. So far these sales have not materially affected the market for American tools here, these being in good demand, and many dealers say their volume of sales for 1919 exceeds that of the corresponding period of 1918.

Duty Based on Weight

Although an added burden, dealers say the increased duty on machine tools will not greatly affect the sales of the American products, if the exchange handicap can be removed. As the duty is based on weight, it will have more effect on the sales of heavy tools and machinery, most of which was supplied by England and Germany before the war.

The fear of German sales at prices based on the depreciated value of the mark also overhangs the French market.

The enormous expansion in the use of machine tools during the war has caused a surprisingly small increase in the number of French machine tool builders. The following is a list of firms of interest to American manufacturers:

H. Ernault, 46 Rue Ledru-Rollin, Ivry, Paris. Built a new factory just before the beginning of war; makes lathes (single pulley drive) and double spindle horizontal boring machines; far behind in deliveries. The design of the lathes is criticised by some machine tool experts, but the workmanship is excellent.

Cazeneuve, La Plaine Saint-Denis (Seine). Small factory; makes lathes and small tool grinders, for which there was a large sale during the war.

S. O. M. U. A. (Societe d'Outillage Mecanique et d'Usinage d'Artillerie), 19 Avenue de la Gare, St. Ouen. Formerly Societe Francaise de Machines-Outils, then bought by Bouhey, now owned by Schneider; capital, 32,000,000 francs; makes lathes, planers, milling machines, slotting machines, and heavy machines, such as horizontal boring machines; have a good demand for their product and are now sold out many months ahead. The product of this company is said to compare favorably with the best American tools.

P. Hure, warerooms, 218 Rue Lafayette, Paris; works at Pantin (Seine). Makes milling machines, which were bought because of the scarcity of American machines; did not make much progress during war.

Bariquand & Marre, 127 Rue Oberkampf, Paris. Make milling machines and operation lathes, also hair clippers, micrometers, Vernier calipers, screws, taps, dies, gauges, and special drilling machines; very old firm, but their products are not of much importance as competitors of American machines.

Rouchant & Lamassiaude, Limoges. Manufacture vertical milling machines similar to Becker No. 2-A, well built, and price about one-third lower than Becker's agents' price for 2-A; now building No. 4 vertical, copied largely from Cincinnati design; during the war also built shell lathes and shell-centering machines; product before the war was machinery for porcelain industry.

Guilliet Fils, Auxerre. Makers of woodworking machines; have built a large number of lathes for shell work will continue building woodworking machinery, which is in active demand, but will also build vertical boring mills.

Leflaive & Cie., St. Etienne. Are building some large machines, such as boring mills, lathes, and planers.

Guillemin, Sergot & Pegard, Albert (Somme) and at Perigeux (Dordogne). Manufacture engine lathes and shapers.

Jost & Cie., 103-105 Rue Villiers, Paris. Manufacture drill presses.

Cuttal & Cie., 53 Rue Servan, Paris. Manufacture screw machines.

Societe des Usines Curial, 31 Rue Curial, Paris. Has begun to manufacture small tools and expects to develop a large business, having ample financial backing.

With the exception of the Associated British Machine Tool Makers, Ltd., there are no important additions to the number of French machine tool dealers since 1914. Nearly all the dealers have made money during the past five years. Most of them say that business is good, especially in the northern and northeastern parts of France; but even in those sections which suffered most from the German invasion some French manufacturers are buying heavy German tools rather than American, on account of the difference in price. The exchange rate with France, as with other allies, is very favorable to the Germans in selling, 45 francs equalling 100 marks. With the Swiss franc there is even more difference, 100 Swiss francs being worth 141 French francs. The large number of American tools used in France during the war, most of which were creditable examples of American products, have been a great help in educating French manufacturers still further in the use of tools of the best quality.

French Labor Situation Improves

The French labor situation is improving, and the thrifty habits of the French working people are being resumed. The legal working day is eight hours, and the week is 48 hours; the time is made up for Saturday half holiday. In small factories the employes often voluntarily work 9 and 10 hours a day at a proportionate increase in pay.

Prices established for labor during the war have shown no tendency to recede. The prevailing wages in and around Paris and in other manufacturing centers where labor is in good demand, compared with prewar wages, are as follows:

	1919	1914
	——Francs——	
Lathe hands	3.75	0.95 to 1.25
Assemblers	3.80	0.95 to 1.90
Toolsmiths	4 to 5	1.25 to 1.90
Helpers	2	0.80 to 1.05

The industrial outlook in Italy is uncertain. The lack of coal and other natural resources is a heavy handicap to any nation that seeks to thrive from manufacturing, although in Italy this lack is partly made up by the development of water power, the sources of which abound in the northern part of the country. Near Bellagio, in the Como district,

ANTEDATING the article published in the Oct. 30 issue of THE IRON TRADE REVIEW, *by about one month, the accompanying report by Alexander Luchars, president of the Industrial Press, New York, publisher of Machinery, was written by him to the department of commerce while he still was special trade commissioner to Europe from that body. It was published by that organization under date of Oct.* 11, *and deals with the situation in various European countries as it relates to American-made machine tools and possible markets for them abroad. Mr. Luchars resigned from the department of commerce under date of Oct.* 1.

where coal is selling at $70 a ton, 5000 men have been working for months on a hydraulic plant to generate about 4000 horsepower for the railways.

Agents for American machine tools in Italy are not of one opinion as to the future for these goods, but are looking forward hopefully now that import restrictions have been removed. On certain lines, especially heavy machines and the cheaper grades of machine tools, there probably will be serious German competition, and American manufacturers will have difficulty in meeting this competition unless German manufacturers are further handicapped by labor and material costs. On heavy presses and forging machines, large radials and milling machines, planers, and special tools for metal products American firms will be unable to compete with German prices on machines delivered in Italy; and the cheaper grades of standard machine tools, of which there are so many German makers, will appeal to many Italian manufacturers who are not educated to paying the difference between the best American tools and German products at 25 to 33 per cent less.

The demand for high priced labor-saving tools will come from such concerns as Ansaldo and Fiat, but it is probable that the small manufacturers will be content with the cheaper and inferior tools. Ansaldo continues the policy of general expansion followed before the war, having no less than 27 different establishments and six associated concerns and employing 50,000 workers. The Fiat Works made a considerable number of machine tools for its own use during the war and will continue to make lathes for the market.

Italian Industry Grows

According to the president of the Association of Machine Tool and Small Tool Importers and Merchants, during the war there were in Italy less than a dozen factories producing machine tools exclusively, employing a total of 1500 workers. There were also about 30 plants producing machine tools as a side line. Of all these factories, only three or four of the smallest specialized on a single type of machine, the others building varied lines in the old-fashioned way. Now there are about a dozen, employing about 2000 workers, which produce very good lathes, shapers, small milling machines, drilling machines and a variety of special tools for metal sundries. The value of the annual production of machine tools before the war was about 30,000,000 lire at present prices (a lira is now worth between 9 and 10 cents United States currency; normal value, 19.3 cents). This rose during the war to 90,000,000 lire and now is estimated at less than 10,000,000 lire. Although there are a few Italian machine tool makers who produce machines of excellent quality, it is not probable that Italy soon will become an important factor in the production of these tools.

The Swiss machine tool market is small. For American tools of high reputation the demand will continue as Swiss mechanics appreciate tools of quality. The Swiss franc is worth more than the French franc, so that German tools sell for correspondingly less, and buyers institute comparisons between the American and German prices that are sometimes difficult to meet. On large tools this difference is striking; for instance, a 24-inch turret lathe costing approximately 25,000 Swiss francs at New York, with transportation 5000 francs, would cost 30,000 francs in Switzerland, as against 13,000 francs for a German machine of similar type. Only the high reputation and sterling quality of American machines will enable foreign dealers to sell them in the face of such price competition.

Before the war there were only two machine tool concerns of any importance in Switzerland—the Oerlikon Works, at Oerlikon, near Zurich, and Fritz Wunderli, at Uster. During the war a number of machine builders produced radials, boring mills, tool grinders, screw machines, small plain milling machines, small lathes and other light tools. Oerlikon, which is the oldest machine tool concern in Switzerland, and has a reputation for good work, builds engine lathes, horizontal and vertical milling machines, No. 3 horizontal boring machines, floor and table types, and radial drills; it also has under construction a No. 2 milling machine, a type popular in both Switzerland and France, and a high-speed lathe, geared head with hardened and ground gears made by Maag, of Zurich, and said to be quite a departure in that line. Fritz Wunderli produces small universal grinders in two sizes, wet-tool grinders, and surface grinders, which will bear comparison with American machines. During the war he built many small plain milling machines for England. Now, there are a number of other smaller makers, including the following:

Kellenberger & Co., St. Gall, tool grinder.
Schaufelberger & Co., Zurich, a radial drilling machine with single pulley drive, lathes, milling machines, turret lathes, and horizontal boring mills.
G. Betz Fils & Co., Basel, shapers.
H. & J. Graa, LeLocle, precision lathes.
Buhlmann & Simonet, Solothurn, precision lathes.
Fabrique de Machines Essaime, Tavannes, presses, lathes, shapers, drilling machines, screw machines, and gages.
Max Thum, Geneva, small grinders.
O. Seeberger & Co., Brougg, a line of planers.
Henri Levy, Rorschach, universal milling machines of the column-and-knee type.
Benninger, Uzwil, lathes of geared-head and cone-pulley types.
Sarbach, Geneva, cylindrical grinders and surface grinders of the vertical-spindle type.
Petermann, Moutier, screw machines.
Schroter & Jenny, Schaffhausen, gear hobber, Pfauter type, but following the Eberhardt design, also a line of engine and turret lathes.

Holland Has German Tools

The Netherlands is an agricultural and a trading rather than a manufacturing country, but the increase in manufacturing is distinctly noticeable.

When the blockade became effective Dutch manufacturers and dealers were entirely cut off from American supplies. Only since July have orders been coming through. One large shipbuilding company then began receiving deliveries on a steel order placed in 1916. Shipbuilding, which is one of the most important Dutch

(*Concluded on Page* 1260)

French Make Autos

FRENCH producers of automobiles really are makers instead of manufacturers. All the high priced French automobiles include special features that appeal to the French buyers; in the American product these features usually are sacrified for increased output. While of course there is no such market for automobiles in France as exists in America, still the principal demand for machine tools at present comes from the automobile manufacturers, all of whom are busily preparing for 1920. *Several makers are trying for the low priced field. Some of the more important manufacturers of automobiles are as follows:*

Renault, Billancourt (Seine), who employed about 27,000 hands when the armistice was signed.
Panhard-Levassor, 17 Avenue d'Ivry, Paris.
Delaunnay-Belleville, St. Denis (Seine).
Saurer, Puteaux (Seine), motor trucks.
Unic, Quai du General Gallieni, Puteaux (Seine).
Auto De Dion Bouton, Quai National, Puteaux (Seine).
Lorraine-Dietrich, Argenteuil (Seine et Oise).
Clement-Bayard, Quai Michelet, Levallois-Perret (Seine).
Hispano-Suiza, Rue de la Reunion, Bois Colombes (Seine).
Peugeot Rue Dantan, Levallois-Perret (Seine).
Brasier, 2 Rue Galilee, Ivry-Port (Seine).
Hotchkiss, Route de Gonesse, St. Denis (Seine).
Citroen, 31 Quai de Grenelle, Paris.
Berliet, 239 Avenue Berthelot, Lyon.
Rochet-Schneider, Chemin Feuillat, Lyon.
Zenith, Chemin Feuillat, Lyon.
Cottin-Desgouttes, Place du Bachut, Lyon-Monplaisir.
La Buire, Place de la Buire, Lyon.—Luchars Report.

Builds Carriers for Foreign Ore

New Bulk Freighters for Bringing Iron Ore From Chile and Cuba Have Unusually Large Hatches and are Designed to Facilitate Quick Loading —Normal Load is 11,500 Gross Tons

BY V. G. IDEN

TO TRANSPORT iron ore from its deposits owned in Cuba and Chile, the Bethlehem Steel Corp. is building a fleet of cargo carriers which show some decided advances in the art of marine architecture. This corporation has already built five vessels of the type that will be used in the Cuban trade, and contemplates constructing eight more for that service. Due to the limitations of the Cuban ports, it was not possible to construct vessels of the size that can be used in bringing ore from Chile. The first boats are known as the Cubore type, since the first to be built was named CUBORE. They are 11,669 deadweight tons each, equipped with geared turbines capable of 2400 shaft horsepower. They have three boilers and bunkers fitted for coal or oil fuel. A smaller steamer, the MANGORE, of 6140 tons deadweight capacity of the same type is also in service to the ports that will not accommodate the larger vessels.

The three sister vessels now in operation are the FELTORE, SANTORE and FIRMORE. The CUBORE was placed in commission in September, 1917. She was diverted to the army service by the government in June, 1918, and was torpedoed on Aug. 15, 1919, while in that service. The other four vessels have since been returned to the owning and operating company, the Ore Steamship Corp., and are now in service transporting ore from Cuba to Sparrows Point, Md.

Import Ore Under Difficulties

Bringing ore from a foreign country to a plant in the United States is a different proposition from transporting ore on the Great Lakes where the movement is entirely domestic. The Ore Steamship Corp. vessels must have foreign clearance papers and comply with all the regulations of the customs authorities at home and abroad which considerably retards the operations. In Cuba they are not able to dock at night and they are subjected to different weather conditions than prevail on the Great Lakes. Despite the handicaps incidental to the trade of these vessels, carrying approximately 11,300 tons of ore per trip, one will make the round trip between Cuba and Baltimore in 12 days, delivering 25,000 tons of ore per month.

Naturally these vessels, being designed for ocean service, are not as long as the ore carriers of the lakes. While the Cubore type is capable of carrying a cargo as great as the largest of the lake carriers, it is intended further to reduce the cost of operation by increasing the size of the vessels to be used in the Chilean trade. It was impossible to build the Cuban ore boats any larger because of the limit of the harbor facilities, but this will not operate against the ships to be sent to Chile. The company intends to construct vessels of approximately 20,000 deadweight tons for this trade. The plans for the latter are now being drafted and the program of the corporation calls for a fleet of 15 to 20 vessels of that size when the building is completed.

Although built primarily for the Cuban and Chilean ore trades, these vessels have successfully carried, in the transatlantic service coal, grain and general cargoes. One of the prime features of their design was the direct inspiration for probably the

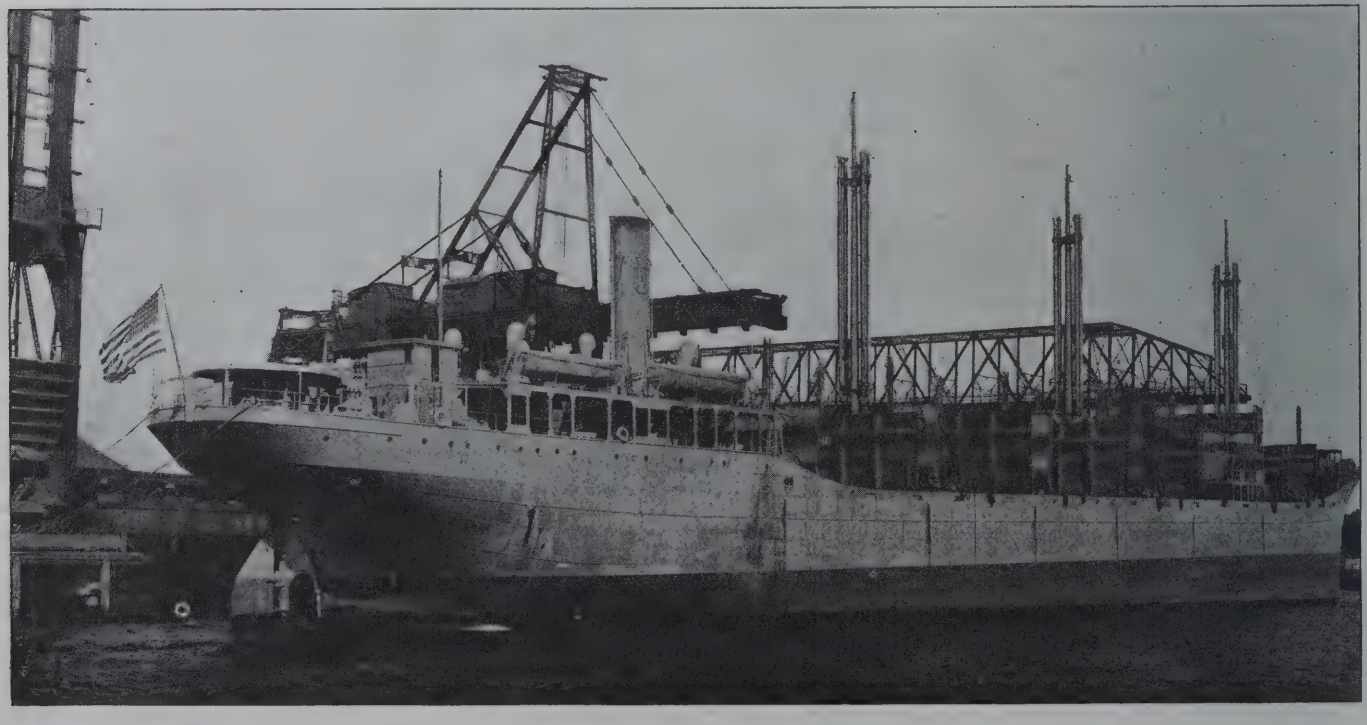


FIG. 1—ORE VESSEL MOORED AT SPARROWS POINT WITH HATCHES OPENED READY FOR UNLOADING—MACHINERY IS INSTALLED AFT TO GIVE AN UNOBSTRUCTED HOLD

FIG. 2—DECK VIEW SHOWING THE HATCH COVERS AND TACKLE FOR RAISING

greatest transportation feat accomplished by the army during the recent war. The vessels were built with hatches of extreme size. The hatch covers are made of corrugated steel plates in two sections which open up like a door and lay back upon a framed superstructure on the deck. There are no obstructions in the hatches and no stanchions in the holds. This arrangement gave the inspiration to the transportation service to ship completely set-up locomotives and tenders to France. They were loaded into the holds without necessitating the least alteration to the vessel. The success attained in this instance resulted in considerable saving of time for the army in placing such equipment in service in France.

The Cubore type ship is 469 feet long over all, with a molded beam of 57 feet and molded depth to upper deck of 37 feet. Hatch No. 1 is 26 x 33 feet, Nos. 2, 3 and 6 are 33 x 37 feet, Nos. 4 and 5 are 37 x 39 feet. This leaves a free deck but 10 feet wide at either side of the principal hatches and on this deck space are placed cargo winches which serve to open and close the hatch covers and to handle cargo whenever necessary. The hatches have steel coaming and hinged corrugated steel covers in two parts.

Quick Loading and Unloading

All the cargo hatches can be opened and shut within an hour. The Cubore type loads 11,500 tons of ore within 5½ hours with the improved loading machinery installed in Cuba. The unloading facilities at Sparrows Point are to be improved. At present 5-ton buckets are being used but these are to be replaced with 15-ton buckets. It now requires about 18 hours to unload whereas it is expected to be able to unload within five hours with the new equipment. At Daiquiri, Cuba, the vessel lays offshore about 215 feet and is moored to 10 buoys under a cantilever. Ore is delivered by a belt conveyor. At Felton, in Nipe bay, Cuba, the boat goes up to a dock and ore is delivered over two ore bridges. When laying up at these ports, the vessel will draw about 27¾ feet mean of water, and will draw nearly 29 feet aft when leaving loaded.

The vessels have averaged 10 to 10½ knots when loaded and 11 to 12 knots when in ballast. Other bulk carriers have been designed for ocean service, but this particular type of boat was built to meet a particular condition and to cope with a competition that is extremely aggressive, the cheapness of ore transportation on the Great Lakes.

They are single-screw built of steel on the Isherwood system, and meet the specifications of American bureau of shipping and Lloyd' register classification insofar as concerns design and construction of the hull, deck equipment, engines, boilers and shafting and the installation of bilge and ballast system. There are three cargo holds with six hatches, two to each hold. The vessel has four watertight bulkheads, one nonwatertight bulkhead and two oiltight bulkheads. She has three masts, 12 booms, 6 winches, one windlass, one capstan and one steering engine. Accommodations are provided for 46 officers and crew.

The single screw is run by a geared turbine. The vessel has three Scotch boilers with all necessary auxiliaries. The building specifications required that the vessel be capable of carrying about 11,300 tons, of 2250 pounds, including cargo, 6000 gallons of fresh water, fuel, stores, feed water and extra spares over what is required by the classification societies, but excluding water in boilers and condensers on a maximum mean draft of 27 feet in salt water. The deadweight requirements were exceeded, however, by the Sparrows Point plant of the Bethlehem Shipbuilding Corp. where the vessels were built.

Other Modern Fixtures

The ship is steam heated and electrically lighted. A cross bunker for fuel oil or coal is located forward of the boiler room. It has a steel oiltight center line bulkhead, fitted fore and aft, also necessary webs and swash plates. The bunker extends from the double bottom to the upper deck. Bolted places on channel frame are made oiltight to fit over openings to the fireroom when used for oil

FIG. 3—TYPE OF ORE BRIDGE USED FOR LOADING AT FELTON, NIPE BAY, CUBA

fuel. Side bunkers for coal are located on the port and starboard sides of the engine and oiler spaces between upper and lower decks.

The vessel is fitted with a turbine engine and a high and low speed reduction gear. The engine is designed to have a maximum efficiency when delivering 2400 shaft horsepower at 90 revolutions per minute, but to be capable of delivering a maximum shaft horsepower of 3000. The boilers have a working pressure of 200 pounds per square inch. The turbines are so arranged that the ahead turbine and the reversing turbine are carried on one shaft and in the same shell.

Make Transformer Cases of Sheet Steel

Distribution transformers in which it is claimed a reduction in weight of over one-third has been attained by substituting welded sheet steel cases for those of cast iron, are now manufactured by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. No change has been made in the coil construction and insulation, but an improvement has been effected in the tank construction. The new 10, 15 and 50-kilovolt-ampere transformers are about the same weight as the old 5, 7½ and 25-kilovolt-ampere transformers, respectively. The desirability of reducing the weight of the transformer suggested the use of the sheet metal cases and end frames. In order to weather-proof the cases, they are first sand blasted, a coat of priming paint is applied and baked, and a finishing coat, heavy in oil and designed to withstand the wear of the elements, is applied.

A complete transformer case is made from five different parts. The rim and base of the tank are drawn and cut from a single piece of sheet steel. The tank wall is formed from two sides which are drawn and welded and the rim and base are welded to the tank wall. Thus, four parts complete the tank and one part the cover.

German Machine Tool Prices Low

(*Continued from page* 1257)

industries, was almost suspended for lack of material. German material manufacturers refused to sell the Dutch unless the latter executed an agreement that the ships built therewith should not be used by any of the allies for a period of five years; and similar restrictions were insisted on by British material manufacturers against the central powers.

Many Dutch machine tool dealers, being unable to get American tools, turned to German makers, not only to keep their business going, but also because German tools were offered at bargain prices, especially during the last six months of the war, consequently the Dutch market is overstocked. It is estimated that these stocks can be worked off by 1920 or 1921, if shipbuilding and the other industries requiring them continue to be prosperous. The German tools I saw in the Netherlands, built during the last months of the war, were mostly of inferior quality and finish to those now produced by the best German makers, and if those in the warehouses are no better there will be great difficulty in disposing of them, even at bargain prices. Swiss tools cost about the same as American in Holland.

Fig. 2

Fig. 3

METHOD OF ATTACHING INDICATOR CORD HOOK

German commercial travelers canvass Holland thoroughly, and up-to-date German catalogs and price lists, evidently prepared and printed since the armistice, have been sent out broadcast. Many of these have been produced almost regardless of cost, creating an impression of productive ability in striking contrast with the actual conditions to be found in Germany.

The Germans show great ingenuity in converting war material into articles for use in peace times; these are offered at very attractive prices. One German manufacturer of structural and bridge material, cranes, etc., is offering such material at about one-half what it can be produced for, as they say their government has already paid them a large proportion of the contract price. For this class of American products, in Holland and elsewhere in Europe, there is a limited market, on account of the heavy freight charges. Neither the German nor the Scandinavian product that I saw equals the best American machine tools in design and workmanship, and there will be a market for American tools in spite of the present large stocks of German machines. How American manufacturers can compete against the better quality of German tools that now are being turned out by the best makers is another question, however.

Hook Aids in Attaching Indicator Cord

A simple and ingenious indicator cord hook designed to enable the engineer to connect the indicator cord with the cross-head of a high speed engine as easily and quickly as with a low-speed engine has been developed and patented by the Trill Indicator Co., Cory, Pa. Connecting the ordinary indicator cord to the standard on a cross-head involves unusual difficulties, especially on high speed engines. Not only does the engineer risk his life, but there is danger that the indicator may be wrecked.

The accompanying illustrations clearly show how the hook is attached while the engine is running. The loop of the hook is held between the thumb and the finger as indicated in Fig. 1, in such a position as to allow the pin on the standard to strike the straight part of the hook when the standard is within about one inch of the end of its travel. The hook swings about the thumb and finger as a pivot, as shown in Fig. 2, the hook moving downward as the piston reaches the end of its stroke. On the return stroke, the pin on the standard engages the hook, as illustrated in Fig. 3, and the attachment is complete.

The International Motor Co., Allentown, Pa., and Plainfield, N. J., recently acquired substantial holdings in the Wright-Martin Co., Brunswick, N. J.

New Lifting Magnets are Rectangular

Lifting magnets, rectangular in shape, are now being manufactured by the Cutler-Hammer Mfg. Co., Milwaukee, for handling regular shapes in iron and steel including sheets, bars, billets, ingots and pipes. It is claimed that the advantages of the rectangular magnet for this class of work are maximum lifting capacity for the given weight of magnet and greater speed in handling material.

Fig. 2 shows one of the magnets lifting five lengths of round bars. Where long lengths of material must be handled, two or three of these magnets may be mounted on a spreader bar supported by the crane. Fig. 1 shows two of the magnets so mounted and lifting two plates. The body of each magnet is a single electric steel box-shaped casting containing the magnetic coil and having a projection in the center which forms the inner pole, while the outward walls of the casting form the outer pole. The ends of the body are reinforced with heavy ribs to withstand the blows to which this part of the magnet is subjected.

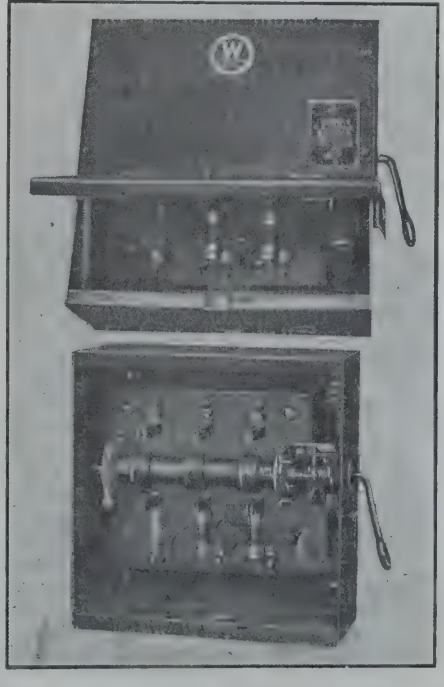
A drum master switch and magnetic switch panel compose the controller, with three positions, on, off and drop. In the drop postion, a small reverse current is sent through the magnet coil which quickly overcomes the permanent magnetism and permits the load to be dropped instantly.

FIG. 1—TWO RECTANGULAR MAGNETS ON SPREADER BAR HANDLING TWO HEAVY PLATES

To Build Open Hearths

Included in the equipment of the proposed plant of the Western Rolling Mill Corp. which is to erect a steel plant at Seattle are three open-hearth furnaces of 50 tons capacity each, two continuous furnaces and probably an experimental electric furnace. It is probable that Wellman-Seaver-Morgan Co., Cleveland, will install the entire equipment. Warner & Porter, Seattle, are handling the finances of the project. As heretofore announced, the first installation will include 9-inch and 22-inch mills for turning out bars, both rounds and flats and angles. J. Johnson, with offices at 401-403 Pacific building, Seattle, is president of the company.

Switch Protects Motor and Operator

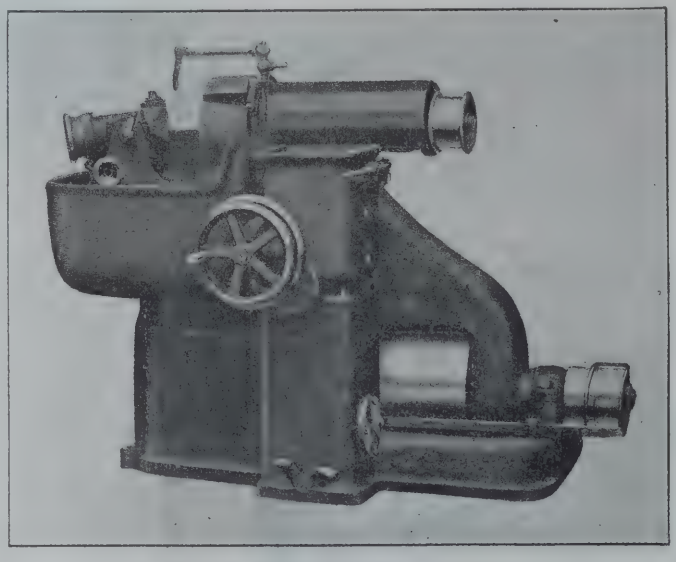


For connecting single or polyphase alternating-current motors of from 1 to 10 horsepower, 250 and 550 volts, directly to the line without the use of autotransformers or resistance, the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., has designed a starting switch to provide protection to both the operator and the motor. As shown in the accompanying illustration, all of the mechanism with the exception of the operating handle is enclosed in a steel box.

A door in the cover gives access to the interior but this door cannot be opened while the switch is closed nor can the current be switched on while the door is open. When the door is open all reachable parts of the switch are dead, thus making it impossible to receive injury from contact with live parts when operating. The upper part of the cover is held in place by screws which can be removed without difficulty by authorized persons to permit inspection of the complete mechanism.

Upon the failure of voltage, a magnetic release automatically opens the switch. In case of overload, protection is provided by means of relays resembling cartridge fuses in appearance, each of which contains a contact connected in series with the release magnet. Momentary overloads do not affect the relays but extended overloads cause the relay contacts to open the magnetic circuit and consequently the switch. Even though the handle is held in the on position, the switch will not remain closed on no-voltage or overload. The mechanism is mounted on a slate base and is protected by the steel case.

FIG. 2—CLOSE-UP VIEW OF RECTANGULAR MAGNET LIFTING FIVE LENGTHS OF 6-INCH ROUNDS



THE DOOR CANNOT BE OPENED WHILE SWITCH IS CLOSED

New Machine Forms Tools By Grinding

For forming cutting tools by the grinding method, Alfred Herbert, Ltd., 54 Dey street, New York, has developed a new oscillating tool grinder equipped with dust exhaust, centralized control and water supply. In this machine, as shown in the accompanying illustration, the grinding wheel oscillates rapidly past the tool by power, thereby reducing exertion of the operator. With the tool always in full view the operator may devote his attention to setting the tool to the required angles and to apply the cut. It is stated that tools of any required shape or angle may be made without the use of loose fixtures, templates or formersers. The wheel spindle, self-contained countershaft, loose pulley, and all shafts in the gear box except the eccentric shaft, run on ball bearings. By means of two handwheels which are both on the same axis and directly under the workman's hand when operating, the wheel can be moved sideways and forward or away from the work without stopping the oscillating movement. A lever controlling the amount of oscillation is situated close to the workman's hands, while the pedal for starting and stopping the machine is placed conveniently near his feet.

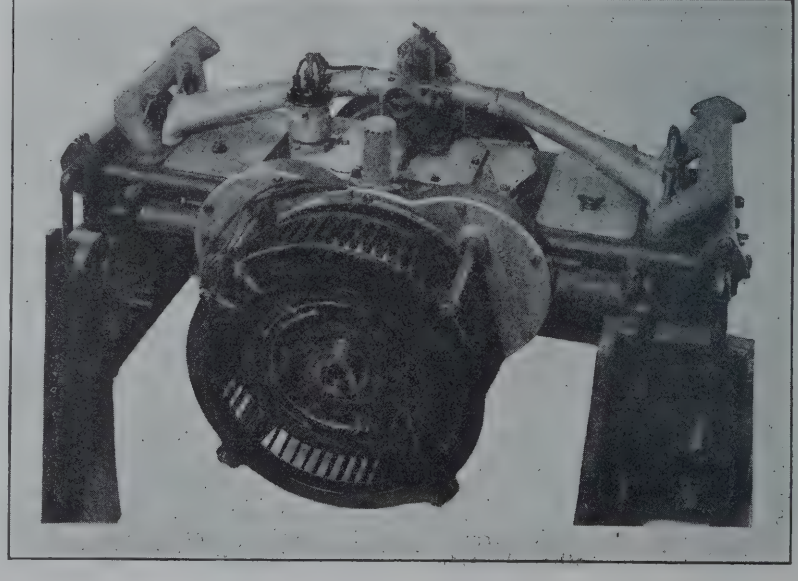
Grinding is performed without water, but a powerful fan connected to a streamline duct in the base of the toolholder draws all dust and chips away. When formed tools are ground after hardening, an adequate water supply is available. The toolholder is universally adjustable for all tools other than those bent to a right angle. A fixture for holding the latter, and for holding the tools while being ground on the base, is the only loose part used in connection with the grinder.

MACHINE FORMS TOOLS BY GRINDING

The grinding of duplicate tools can be facilitated by using the adjustable stops provided to each movement of the toolholder.

To Co-Operate on Piers

To co-operate with the committee of the Society of Terminal Engineers in taking up the question of the size and structural design of 12 piers which New York City proposes to erect on Staten island, the following committee has been appointed by the Material Handling Machinery Manufacturers' association, 35 West Thirty-ninth street, New York:



W. J. L. Banham, general traffic manager, the Otis Elevator Co., New York, chairman.
S. H. Libby, design engineer, the Sprague Electric Works, New York.
Lucien C. Brown, treasurer, Ellwell Parker Electric Co., New York.

A resolution recently was passed by the Society of Terminal Engineers, recommending that the piers which are to be 1100 feet long, should be wider than 125 feet and that the pier sheds should be initially designed to have sufficient strength to permit the installation at a later date of modern cargo-handling machinery, if the city does not propose to provide for such equipment when the piers are constructed. In this the Material Handling Machinery Manufacturers' association thoroughly concurs.

The Chisholm Steel Shovel Works, Cleveland, for 40 years under the management of Henry A. Chisholm, has been reorganized. Mr. Chisholm and A. E. Cook, secretary and treasurer, are to retire and the company will be operated under the management of A. T. Chisholm, formerly vice president of the company, as president. E. B. Greene, of the Cleveland Trust Co., is the new vice president, and H. A. Hauxhurst, attorney, the new secretary. The concern is capitalized at $200,000.

Tests New Gasoline Motor

DESIGNED by Henry Ford and said to weigh only half as much as an electric motor of corresponding power, the gasoline street car motor shown in the accompanying illustration recently was subjected to a trial block test and apparently proved satisfactory to its designer. The new power plant combines in a single unit an engine, air compressor, electric generator and heating and lighting equipment. The engine is of the double opposed type and generates its own electricity for ignition and lighting. Opposing pistons are linked to the same throw by a new type of link. Air for the brakes is compressed by the same power which moves the car and a fan, bolted to the front end of the starter, draws air through the housing of the engine, where it is heated and then exhausted through pipes to warm the car.

Coal Preference Again in Force

War-Time Regulations Re-established With Revival of Fuel Administration's Duties by President Wilson—Steel Industry to be Supplied After Railroad, Government and Public Requirements Are Provided for

WASHINGTON, Nov. 4.—The steel industry will be supplied with coal as far as practicable after the railroad, government and public requirements have been fulfilled, according to orders issued last week by Dr. H. A. Garfield, whose duties as fuel administrator have been revived, and by Director General Hines, of the railroad administration, who has been delegated by Dr. Garfield to exercise certain of the administrator's functions. Both officials are acting on authority of the President who, in an executive order, re-established the fuel administration and refixed prices on bituminous and lignite coal at the level which prevailed at the time of the fuel administration's suspension last February. Under Dr. Garfield's order, steel plants are included in "manufacturing plants on war industries board's preference list."

Director General Hines' last week made the following announcement:

"Having been informed of the issuance of the following order by the United States fuel administrator, the director general has issued instructions through the regional directors to place in effect immediately the provisions of this order:

"'Acting under authority conferred on me by the President of the United States under and by virtue of authority conferred upon him by the act of congress approved Aug. 10, 1917, I hereby revoke the order of the United States fuel administrator issued Jan. 31, 1919, insofar as it suspended the order of the United States fuel administrator of Jan. 14, 1918, effective 7 o'clock a .m., Jan. 15, 1918, and the portion of the order of the United States fuel administrator of May 25, 1918, setting up preference lists, and I hereby restore the said order of Jan. 14, 1918, and said portion of the order of May 25, 1918, to like effect as if they had not been suspended; and I designate the director general of railroads and his representatives to carry into effect the said order of Jan. 14, 1918, and to make such diversions of coal which the railroads under his direction may as common carriers have in their possession, as may be necessary in the present emergency to provide for the requirements of the country in order of priority set out in the preference list included in the order of the United States fuel administrator of May 25, 1918, as follows:

"'(a) Railroads; (b) army and navy, together with other departments of the federal government; (c) state and county departments and institutions; (d) public utilities; (e) retail dealers; (f) manufacturing plants on war industries board's preference list; (g) manufacturing plants not on war industries board's preference list; (h) jobbers; (i) lake; (j) tidewater. This order to be effective at once.'"

Diversion of Coal Provided for

The order of Jan. 14 was as follows:

"All shipments of coal, whether f.o.b. mines or otherwise, and all shipments of coke f.o.b. ovens, or at place of storage or otherwise, shall be made subject to the diversion of such coal or coke by the United States fuel administrator or any persons acting under his authority, to any persons or consumers, and for any of the purposes heretofore or hereafter authorized by him. The title of the purchaser, consignee, or consumer, in the case of any such shipments of coal or coke, which by custom or law might become vested at the time and place of such shipment, shall from and after the effective date hereof be subject to the condition that the coal or coke so shipped may be diverted as aforesaid, and that in case of any such diversion, the title and interest of such purchaser, consignee, or consumer with respect to any coal or coke so diverted shall be completely divested and terminated, and his liability to pay therefor shall cease.

"The person or consumer to whom any such coal or coke is diverted shall become liable as of the time of such diversion to pay to the shipper thereof the price in force at the date of shipment as fixed therefor by or under authority of the President of the United States, plus transportation charges thereon and plus a handling charge of 15 cents a net ton to cover costs of rebilling, collection, and replacement. If such handling charge is made, no jobber's commission shall be added to the mine's price. If the coal or coke so diverted was shipped under a valid and enforcible contract, the quantity thereof so diverted shall not be charged against the amount to which the contract applied."

Before Dr. Garfield had acted, the director general issued the following statement:

"In order to interfere as little as possible with the normal course of coal traffic, the railroad administration up to the present time has permitted coal to go to the designated consignees. For the last two weeks open top equipment has been devoted to coal loading to the exclusion of other classes of traffic, and the movement of such equipment has been expedited so as to facilitate the maximum production of coal. The result has been an exceptionally heavy coal production.

"It having become necessary, however, to be prepared to insure against all temporary contingencies that the transportation service be protected, regional directors have now been instructed to see that each railroad shall accumulate a necessary reserve of coal when it is not already on hand, purchasing such coal if possible, and otherwise holding coal in transit.

"The practice thus resorted to is a practice which railroads have always employed in emergencies, whether under private or public control, and has been recognized as indispensable to the maintenance of an essential public service.

"In holding such coal, exceptions will be made as far as possible of coal destined to certain classes of consignees in the following order of priority, which is the basis of priority adopted during the war by the fuel administration:

"1—Steam railroads; inland and coastwise vessels.

"2—Domestic, including hotels, hospitals and asylums.

"3—Navy and army.

"4—Public utilities, including plants and such portions of plants as supply light, heat and water for public use.

"5—Producers and manufacturers of food, including refrigeration.

"6—National, state, county and municipal government emergency requirements.

"7—Bunkers and other marine emergency requirements not specified above.

"8—Producers of news print paper and plants necessary to the printing and publication of daily newspapers.

"Coal held in transit is not to be unloaded in storage nor used until actually needed, so that if its use is later found unnecessary, it can be forwarded to destination whenever practicable.

"Instructions issued provide that there will be as little disturbance as possible in the distribution of coal but at the same time protecting the necessities of the railroads, which have a public duty to perform."

President Wilson's executive order was as follows:

"WHEREAS, the United States fuel administrator acting under the authority of an executive order issued by me dated the twenty-third of August, 1917, appointing the said fuel administrator and of subsequent executive orders, and in furtherance of the purpose of said orders and of the act of congress therein referred to and approved Aug. 10, 1917, did on Jan. 31, 1919, and on Feb. 20, 1919, execute and issue orders suspending, until

further order by the President certain rules, regulations, orders and proclamations theretofore promulgated relating to the fixing of prices, the production, sale, shipment, distribution, apportionment, storage and use of coal, and whereas it is necessary to restore and maintain during the war certain of said rules, regulations, orders and proclamations:

"Now, Therefore, I, Woodrow Wilson, President of the United States of America, acting under authority of the aforesaid act of congress, approved Aug. 10, 1917, do hereby revoke and annul said orders of Jan. 31, 1919, and Feb. 20, 1919, to the extent necessary to restore all of the said rules, regulations, orders and proclamations therein suspended concerning: (a) Fixing prices of bituminous and lignite coal at the mines; (b) fixing or regulating commissions of persons and agencies performing the functions of middlemen dealing in bituminous and lignite coal; (c) fixing or regulating gross margins or prices of wholesale and retail dealers in bituminous and lignite coal; and do hereby restore all of said rules, regulations and proclamations, to the extent herein provided, to full force and effect, as if they had not been suspended.

"Inasmuch as it is contemplated that it may be necessary from time to time to revoke other portions of said orders of Jan. 31, 1919, and Feb. 20, 1919, and to restore to full force and effect rules, regulations, orders and proclamations, or portions thereof, regulating the production, sale, shipment, distribution, apportionment, storage or use of bituminous and lignite coal, the fuel administrator shall, as occassion arises, restore, change or make such rules or regulations relating to the production, sale, shipment, distribution, apportionment, storage or use of bituminous and lignite coal as in his judgment may be necessary."

Preparing Fabrication-in-Transit Order

WASHINGTON, Nov. 4.—Hearings before various district freight traffic committees apparently having resulted favorably to the shipbuilders and other interests seeking extension of the fabrication-in-transit privilege to include steel for other than buildings, bridges and tunnels, action now is awaited from the railroad administration by which the benefits of this privilege will actually be conferred. As far as can be learned, about the only task confronting the administration is the consolidation of the not widely divergent suggestions of the various committees and the final drafting of a uniform fabrication tariff applicable throughout the United States.

Before the tariff is finally issued, however, there may be a meeting here or in New York of shippers' representatives who will go over the proposed extension order. The original tariff proposed by the administration, after months of effort on the part of shipbuilders particularly to have the subject considered for action, has been amended in one form or another by the various district committees and the changes in the main are said to be agreeable to the interests seeking the privilege. It is the consolidation of the amended forms of the tariff into one applicable order around which interest now centers.

Amendment Adds to Operations

One of the amendments adds "straightening, threading and tapping" to the fabrication operations to which all steel shipped under the tariff may be subject to. The original list of operations included bending, bolting, boring, counter sinking, cutting, drilling, painting, planing, punching, reaming, riveting, sawing, shearing and welding. Efforts were also made to strike out the following paragraph and while not altogether successful before some committess, succeeded in eliminating the words "the" and "of building or bridge": "If the outbound material consists of completed parts or of a completed article, no transit privilege will be allowed. See note." The note was as follows: "Under this provision iron and steel partially assembled, same entering into the frame work or section of building or bridge, will not be considered as completed parts or as a completed article." To the list of steel commodities to which the privilege would be extended, washers and trussels were added.

Rule Opposed by Shippers

In rule 4-A, the proposed tariff covering tariff plants reached by two or more routes, the following conditions were proposed:

"That these transit privileges will not apply on freight received at the transit point over the line of the carrier and forwarded therefrom over the line of another, except where the carrier bringing the freight to the transit point does not participate from the transit point, in the through rate from original point of shipment to final destination. Note—This clause does not apply in the event the inbound carrier has no route over its own lines to final destination of shipment."

This section was opposed by the shippers and amendments were offered to allow transit plants to cross bill tonnage, one carrier against another, in case of inability to comply with this provision due to embargo applying on one line, shortage of car supply, or a physical impossibility of the carrier to perform the balance of the transportation service due to washout, wreck or other misfortune beyond the shipper's control. These are provisions now contained in the so-called salvation clauses in most transit tariffs.

Section B of rule 4 also was vigorously attacked. It provides: "The transit privilege will not be permitted on any traffic unless the through rate from original point of shipment to final destination is applicable through the transit point and applying on an entire route of the shipment." This would destroy the fabrication privilege to fabricating shops other than those on the main line of the railroad intermediate between the points of origin and destination. It was said this would seriously injure the fabrication industry.

An amendment was proposed for a flat fabrication fee plus a mileage scale to be worked out in tariffs and published as a composite fabrication fee not to exceed ½ cent per each 50 miles or fraction, back haul. The administration had proposed a rate of 2½ cents per 100 pounds, but this was suggested to be 1½ cents, for the fabrication privilege, with the back haul scale to be worked out and published as a composite charge.

402,122 Tons of War Iron and Steel Offered

Washington, Nov. 4.—Announcement has been made by the director of sales, war department, that approximately 402,122 tons of iron and steel were held as surplus on Oct. 16. This tonnage includes raw material, semifinished and finished steel, scrap and alloys, and it is being offered for sale, either by negotiations or under sealed bids. The ordnance department holds 391,617 tons. The surplus scrap consists of 200,031 tons; raw material, including ferro-silicon and spiegeleisen principally, 7547 tons; ingots, blooms and billets, 127,530 tons; sheets, plates, rods, pipe, hot and cold-rolled bars and tubing, 65,476

tons; manganese steel, chrome steel, chrome-nickel steel and nickel steel, 1539 tons.

The surplus stocks are widely scattered throughout the country, the larger tonnages being located east of the Mississippi at those plants which were engaged during the war in the manufacture of munitions.

Inquiries relative to these surplus stocks should give specifications of the materials desired, and should be addressed to the chairman, ordnance salvage board, ordnance department, Munitions building, Washington, or to the nearest of the district ordnance offices located throughout the country.

Institute's Allocations Not Binding

WASHINGTON, Nov. 4.—The board of contract adjustment in the war department has held that the allocation notices from the American Iron and Steel institute and its subcommittees, which co-operated with the war industries board during the war, were not orders and did not obligate the government, but were merely the means of bringing together producers and consumers. When this was done, the ruling continues, "the parties were left to perfect the transaction in the ordinary commercial manner."

The decision of the contract board was made in the case of the Mississippi Valley Iron Co., St. Louis, which claimed refusal of the Scullin Steel Co., St. Louis, to enter into a contract for or accept 6000 tons of northern basic iron after the armistice was signed, although the allocation notice had been sent and the iron made prior to the armistice, had resulted in the loss of $129,000 to the Mississippi Valley company, the difference on the aggregate being between $36.90 per ton, the market price at the time, and $15.40, the average price covering a period of three prewar years.

Personal testimony of J. Leonard Replogle, director of steel supply for the war industries board; Maj. W. M. MacCleary, the war department's steel purchasing officer, and W. J. Gruss, assistant to H. G. Dalton, chairman of the institute's committee on pig iron, iron ore and lake transportation, together with that of E. F. Goltra, president of the Mississippi Valley Co., and records of the war department, the war industries board and the institute, gave the contract adjustment board the basis for its finding. The opinion, written by Lieut. Col. Robert H. Carruth, and concurred in by all members present, says:

"The evidence clearly establishes the fact that the American Iron and Steel Institute and its subcommittees were not government agencies and had no authority to make contracts or agreements, implied or otherwise, that would obligate the government. The institute and its committees were, primarily, organized for the benefit of the manufacturers of steel. Their purpose was to co-ordinate the industry and to assist in the prosecution of the war.

"An allocation notice from a committee was not an order nor did it have in any way the effect of obligating the government but was merely a means of bringing together the manufacturers desiring certain materials and the manufacturers possessing the materials desired and when this was done the parties were left to perfect the transaction in the ordinary commercial manner."

The only responsibility, it was found, which the government had in the dealings of pig iron producers with steel manufacturers was that of seeing that a source of supply had been arranged. This was done upon request of the steel manufacturer through the government department with which he had a contract, the department in turn, through the pig iron section of the steel division, war industries board, which depended upon the institute's pig iron committee to find the furnace which could supply the iron.

The iron in question was a portion of 45,000 tons required by the Scullin company to manufacture cast steel slugs for projectiles.

Demands Labor be Bound by Antitrust Laws

Washington, Nov. 4.—Senator Edge, New Jersey, has announced that he soon will introduce a bill to repeal provisions in the deficiency appropriation act by which labor and farmers' organizations are exempt from investigation or prosecution under the antitrust laws.

"When labor imposes unwarranted wages on capital, through threats or coercion, it does not wring such wages from capital, but from the people," said Senator Edge. He pointed out that the senate recently, with scarcely more than a majority present, with little debate and apparently still less consideration as to its effect, defeated by a vote of 31 to 28 a proposed amendment to the deficiency bill preventing exemption of labor unions and agricultural organizations from the provisions of the antitrust laws.

"To the rank and file of the people I believe it will seem strange that at the very time when labor was squaring off, in some cases, I fear, taking the law into its own hands, the United States senate should pass legislation exempting it from punishment if it violate the antitrust law, or statutes prohibiting combinations in restraint of trade," the senator declared.

Free-Trade Zone Bill is Again Introduced

Washington, Nov. 4.—A revision of his former bill providing for the establishment of free-trade zones has been introduced by Representative Nolan, of California, which he says he proposes to press for favorable action in the committee on ways and means regardless of the opposition of Chairman Fordney, who has rejected free zones bills on the ground that they are unconstitutional.

"When the tariff commission began its investigation into the subject of free zones," said Mr. Nolan, "the constitutional question was raised, and since the introduction of the free-trade zone bills at this session it has been raised again by men unfamiliar with the question. The tariff commission recommended the establishment of free-trade zones after making an exhaustive study of this question, submitting to congress a brief which conclusively demonstrates that such zones would not transgress the constitution."

To Roll Bar Iron

A building, 80 x 300 feet, which will house the new merchant mills of the Capital City Iron & Steel Co., Harrisburg, Pa., is now under construction on a two-acre site located on the outskirts of that city. The new mills will roll small rounds, squares, hexagons and special shapes and will be driven by a 650-horsepower Westinghouse motor. It is expected to have the mills in operation by Jan. 15, 1920.

Arrange for Basing Point Hearing

Commissioner Huston Thompson Assigned Case But Likely Whole Trade Commission May Sit on Question of Jurisdiction—Exact Proceeding Yet to be Determined—More Declarations on Subject Are Presented

WASHINGTON, Nov. 4.—While the federal trade commission has decided to begin hearing on the Pittsburgh basing point case on Dec. 2, no decision has been made as to how the proceedings will be conducted. Commissioner Huston Thompson has been assigned the case, but it is likely the entire commission will sit at the commencement of the hearing to determine the matter of jurisdiction and also the extent of the public's interest in the question.

Letters are beginning to reach the commission signifying the intention of manufacturers, associations, their representatives, and others to attend the hearings. In this connection the Southern Association of Steel Fabricators, the Birmingham Civic association and the Birmingham Steel Base bureau, all opposed to the Pittsburgh basing point, have consolidated into the Southern Association of Rolled Steel Consumers, an organization similar to the Western Association of Rolled Steel Consumers which originated the case before the commission.

Although the order of appearance has not been determined and may not until the day of the hearing, it is likely the western association will be given the first opportunity to be heard, first in a general statement and then through questions asked by the commissioners of witnesses called by the association, the proceedings taking the form of congressional investigations. Any and all views will be accepted by the commission, it is believed, until it has decided whether to issue a formal complaint.

Additional views in writing are being received by the commission, chiefly from consumers and associations opposed to the basing point custom. The commission is publishing all views and opinions on the question in book form and will issue supplements of all those received after the original copy was sent to the printer. The book will be for distribution.

Various additional declarations in favor of and opposed to the retention of the Pittsburgh base which have been filed with the federal trade commission are given below.

Endless Confusion Would Follow Change of Base

BY G. E. FREDERICK, SECRETARY AND MANAGER,
Kokomo Steel & Wire Co., Kokomo, Ind.

THE steel industry has grown up around Pittsburgh as the pioneer in the development of this industry. Large plants controlling the larger part of the production of steel in the United States have grown up around this point, based upon an extended trade to all parts of the country. To establish several basing points at different sections of the United States say Birmingham, Ala., Chicago and Pueblo, Colo., without taking into consideration the freight rates from Pittsburgh to these various basing centers, would deprive these large plants at Pittsburgh of a market, which they have enjoyed since the establishment of the steel industry in our country. In fact I know of no company owning plants in Pittsburgh or the valley that would not suffer a marked loss of trade, unless it would be such a company as the Steel corporation, which owns plants, not only in the Pittsburgh district, but in Chicago, Duluth and Birmingham. The existing steel companies located in Pittsburgh, with their large production, would be forced to abandon a large percentage of their trade to the West, or else move their plants to the basing centers, in order that they may be in a position to meet competition of those companies who happen to have plants located in the various basing centers, which we presume would be those mentioned above. They must either do this or depend entirely upon the export trade to consume the surplus, which they have been sending west, unless they desired to continue to send it west at a considerable loss; the result of abandoning the Pittsburgh base as the one controlling basing center for the steel industry in the United States. Temporarily at least if a reasonable profit only is to prevail in steel, the changed basing points would result in a shortage of the supply of steel to the various sections of the country, which are now depending upon Pittsburgh to supply them with this material, for Chicago, Duluth and Birmingham, would not be adequate on a basis of their present production of steel to supply Pittsburgh's quota, should this steel be withdrawn from the market on account of the change in basing points. But even should Pittsburgh continue to ship steel, it would be considerably handicapped, and the tendency of the other basing points would be, on account of their advantage, to increase their capacity until they were able to meet the demand in the zone which they control. The result of this, as you will readily see would be to greatly increase the production of steel at the new basing points and the languishing of the steel industry in Pittsburgh and the valley.

Would Concentrate Steel Production

Again to have more than one basing point would be to concentrate the production of steel at two or three points or centers in the country and a plant located half way between Chicago and Pittsburgh could never expect to be a large producer of steel because it would be at a marked disadvantage with steel mills located at the basing center, with the result that we would have steel works gathered in a few centers in the country and not distributed through the various states promiscuously as at the present time, with a greatly increased possibility of severe strikes and labor troubles, which would be disadvantageous to the industry as well as the general public.

As an illustration, take a plant located as our own between Pittsburgh and Chicago. If Chicago is a basing point, we will be handicapped on shipments west of the Mississippi about $3.40 a ton, this on a year's output of 120,000 tons, on the theory that all of our business went west of the Mississippi would be in the neighborhood of $400,000 handicap against Chicago as a basing point, the net result will be that of necessity we will have to move our plant to the basing point, for no business concern would consider an annual handicap of what would constitute an excellent profit for each year, for it would be impossible for us, in the limited zone between Pittsburgh and Chicago as basing points, to market our production, we could only cover a small portion of the state in which we are located on a par with either of these basing points, and certainly the territory in which we would have an advantage, because of our geographical location, would be confined to a very few counties. In fact we would destroy that condition, which is one of national security, and we so found it during the war. Large bodies of men, concentrated at any point engaged in the same industry are a menace to a certain degree, to continuous operation of plants, because strikes and labor troubles of every

sort are liable to occur, which interferes with the nation's business and development.

Better With Industry Distributed

The country would be much better off with the steel industry distributed over the United States, as they exist today; their location being based upon a study of the business condition, freight rates, supply of raw material and labor, rather than have this natural condition supplanted by an enforced artificial arrangement brought about by an arbitrary fixing of basing points, for if this proposed change is made, endless confusion will result; cities which are flourishing and which were pioneers in the industry, some of them will languish. The East will be handicapped and with its tremendous industry, will have as its zone only a small strip of territory along the Atlantic ocean; to advance beyond the central portion of Ohio into western Ohio or Indiana it will have to assume a handicap in the form of an excessive freight rate charge.

For a number of years it was practically the only steel producing center in the United States and wherever steel was used, the consumer or buyer of it had to look to Pittsburgh. Pittsburgh was built upon the basis, not of a part but of the entire trade in steel of the country. Endless confusion in prices will result; communities that are in a flourishing condition, their prosperity being based upon the fact that they were built around a steel plant, will lose their chief industry and the community will languish because many of them will have to either go out of business or move their plants to new steel producing basing points, and as stated above, no company existing, will be exempt from the radical changes that will occur except the Steel corporation who have plants in all of the basing centers, and which will because of that, practically have a monopoly of the market, and be the only concern that would not suffer a handicap.

Single Basing Point Best

Personally I believe that the present arrangement of having the single basing point, is the best arrangement, because it will allow the development of the steel industry in anv city or in any state in the Union that enjoys an advantageous position, with regard to fuel, raw material or labor, and this after all is the economic result sought to be attained. Few vicinities have all of the raw materials, in fact none, and while Duluth may have iron ore, she has no coal, while Indiana has plenty of coal and no iron ore, and is the center of population. The situation should be left as near the present arrangement as possible, if the general distribution of the demands for raw material and labor is to be the most uniform throughout our country, and if we are to preserve and leave open the door of opportunity to each and every community in our country to develop its industrial life. I cannot feel that we would serve our country best, by forcing the great army of laborers, who work in our steel plants into the congested area of a few great cities and their vicinity. The proposed change could result in nothing else but creating a few great steel producing centers around which all of the steel plants of the United States would be centered.

One Base Spurs Competition

BY W. H. DONNER, PRESIDENT,
Donner Steel Co., Inc.

REGARDING the question of selling rolled steel on a Pittsburgh basing point basis, we mention various reasons why in our opinion this practice should be continued for the best interests of all concerned.

(a) Buyers and sellers have been educated along this line for some time past and the practice is thoroughly established and understood.

(b) The Pittsburgh district is the largest steel producing district in the United States, and being centrally situated reflects at all times the actual steel market better than any other location. The valleys and other nearby points should be considered as forming a part of the "Pittsburgh district" in considering the tonnage, although rates vary slightly.

(c) The custom conforms to good commercial practice both from the standpoint of buyer and seller. This is true especially from the buyer's standpoint, for it enables him to determine instantly the lowest quotation which he has received from several districts, as he immediately looks for the lowest quotation "Pittsburgh basis." To establish various basing points, therefore, would complicate the situation exceedingly as it would be necessary for the buyer, upon receipt of quotations from various producing points, to determine the freight rates from such producing points to his point of consumption in order to arrive at the lowest quotation which he would then have in hand.

(d) There is no steel producing point which can supply at all times the demand of a given district, and as a consequence buyers of that district are at certain periods forced into other markets, and they naturally look to the greatest producing district—Pittsburgh.

(d) For example, under ordinary conditions we enjoy a good share of the business placed in Buffalo and vicinity, but there are times when our order book may become such that we cannot meet the demand, and buyers of this vicinity consequently are forced into other districts.

(e) The practice certainly encourages legitimate competition and in this respect is of considerable moment to the buyer who is always interested in securing competitive bids. There is, however, a certain condition always to be considered, and that is the fact that buyers usually place their business at a time most convenient to their needs, while on the other hand the seller's order book changes frequently, thereby developing a situation which would prove serious to the buyer were it not possible for him to go into other districts to secure his requirements. For example, Buffalo mills may be able to meet the demand in this vicinity today, but Buffalo buyers may not be placing orders, and the result is that mills fill up with business from other sections, and when buyers are ready to place orders they find the mills of their district sold up and are forced to place their orders elsewhere.

We have given the question considerable thought both from the buyer's and sellers standpoint, and cannot see any reason why Chicago should be established as a basing point any more than Buffalo, Youngstown, Bethlehem, etc. In fact, we are satisfied that any deviation from the present practice will accomplish no particular good for either buyer or seller, but on the other hand will seriously complicate the situation for all concerned.

Present System Is Logical One

BY JOHN BINDLEY, PRESIDENT,
Pittsburgh Steel Co.

SO far as we can determine, our customers are not desirous of a Chicago basing point on our products, nor would we care to sell on a Chicago basis. To us it seems purely a commercial question. To meet the competition of mills in Chicago or other places, such as Worcester, Mass., Bethlehem, Pa., Johnstown, Pa., Buffalo, N. Y., Cleveland, O., Youngstown, O., Ironton, O., Pueblo, Colo., Atlanta, Ga., and Brmingham, Ala., we must give to our customers such prices, terms and conditions as will make our goods cost them no more than our competitor's prices, terms and conditions laid down at destination.

The practice of quoting on f.o.b. Pittsburgh basis, is a simple and convenient means of comparing prices, for both the buyer and the seller, and has prevailed for many years. The buyer and the seller would be greatly confused, annoyed and inconvenienced and in no way benefited if an additional basing point were made. The establishment of one new basing point would, in our opinion, inevitably lead to many more, until eventually every place where steel is produced would have its own basing point.

We are strongly in favor of the present method of making quotations not alone by virtue of its long standing usage, but because it is most logical, sensible and convenient. We believe that the establishement of a Chicago basing point would in the long run benefit neither buyer nor seller. This was once tried and abandoned. The movement of commodities and prices will follow the supply and the demand. The basing point does not determine the price of the commodity; it is only a means or rule by which to measure the price.

For these reasons we favor the retention of Pittsburgh as the sole basing point for prices on steel products and enter our protest against the establishment of any additional basing point.

Works Council Standing the Test

Experience of 225 Concerns With Representation Plans Has Been Favorable, Although Too Brief to Warrant Final Conclusions—Strikes Not Abolished, but Their Number and Severity Minimized—Results Summed Up

BASED on reports embracing 225 works councils in operation in 176 different industrial concerns in the United States, the national industrial conference board, Boston, declares that the experience of employers with employe representation "has thus far on the whole been favorable." The board concludes, however, that the experience with the works council movement has been too brief to warrant final conclusions, and states that nothing might be gained by the establishment of works councils in those plants where harmonious industrial relations already exist. In the term "works councils" the board includes the two broad types, the "governmental system," following the lines of the national government, and the definitely organized committee system, but does not consider occasional meetings of employers with committees or deputations of employes. The eport states:

"While a choice between the 'governmental' and the 'committee' types of organization is largely a matter of personal preference, experience indicates that the 'committee' type in general is the more desirable because of its greater flexibility. In large establishments, in particular, the 'governmental' type has the disadvantage, that in order to be properly representative of the employes it must necessarily be so large as to be unwieldy. Also all questions, however trivial or local, arising in any part of the plant must be referred to the house or senate, and thereby become the concern of the whole plant. These difficulties are avoidable in the 'committee' type of organization, since it permits of the development of divisional committees in the smaller units of the plant.

"In about half of the establishments covered a single works council handles all matters coming up for adjustment. In numerous large establishments, however, in order that all interests may be effectively represented, it has been found advisable to have, in addition, divisional committees such as departmental, shop, or craft committees. Sometimes, moreover, it has been found desirable to create an executive committee or to develop subcommittees."

In a majority of establishments the workers have their own committee which meets in joint session with a committee or other representatives of the management. In some plants, however, the council is a joint body composed equally of representatives of the management and employes. The report inclines to the view that the latter form has certain advantages over separate committees.

Ultimate settlement of matters failing of adjustment by the works council is provided for by compulsory arbitration in only a small minority of establishments. A smaller number of plans, effective, however, in over twice as many establishments, provide for final submission to arbitration if the parties at the time agree thereto. Ultimate power of settlement rests with officials or the board of directors of the company in relatively few cases. The plans in a majority of establishments make no provision for further reference after the works council has failed to reach an agreement. As a matter of fact, in experience with works councils thus far, matters have seldom reached a deadlock.

Seem to Be of Some Benefit

In most cases, works councils are reported as having produced favorable results, although in a number of instances, chiefly of committees organized by direction of the national war labor board, they have apparently accomplished little or no good. In a few cases their introduction has tended even to aggravate labor difficulties. But on the whole they appear to have produced some benefit.

The beneficial result most frequently reported is an increase in good will and in co-operative spirit between employer and employes. A considerable number of employers reported specifically that labor difficulties were reduced because of the introduction of works councils. In several instances the works council was the means whereby strikes were prevented in individual establishments when strikes were general in the same industry or locality. It is true that labor disturbances have at times occurred in establishments where works councils have been introduced. Against this unsatisfactory experience, however, is to be placed the statements of the managements of several of these establishments that, in their judgment, the works council had modified the severity of the disturbance, and that they still regarded the councils as of decided value.

In several cases the works council was reported as influential in reducing labor turnover. Difficult questions involved in the execution of awards of the national war labor board often have been satisfactorily handled by works councils.

With respect to productive efficiency, evidences of positive benefit resulting from works councils are comparatively few, although in some establishments marked increases in output were attributed, in part at least, to the existence of such organizations. In a few instances efforts have been made by works councils to reduce absenteeism and tardiness and to develop improved working methods, but the sum total of accomplishment along these lines is small.

Employers generally reported that a relatively high type of employe has been elected to membership in works councils. Further evidence of this is found in the decided preference shown for men long in the service of the establishment as council members. Instances of radicalism or unreasonableness on the part of employe members of works councils are conspicuously few.

Experience thus far is so varied that no definite relationship between works councils and trade unionism can be said to have developed.

"The works council is not," states the report, "in its essence a substitute or an alternative for labor union organization. In recognition of this fact, some notable plants of employe representation expressly provide that employes shall not be discriminated against because of labor union membership. While the works council tends to restrict the activity of the labor union in matters purely local to the individual establishment the union may still be potent in settling problems common to the entire craft, industry, or locality."

The report concludes as follows:

"In view of the conflict of experience, it is as yet too early to measure definitely the permanent value of the works councils movement. Approximately three-fourths of the employers having works councils from whom an expression of opinion was secured declared themselves in favor of this

form of industrial organization or that their experience had been favorable. Although further experience may lead to a revision of judgment in some cases, the results thus far obtained with works councils indicate that they are worthy of unprejudiced consideration on the part of American industry."

Bills to Curb Aliens Are Recommended

WASHINGTON, Nov. 4.—Arising from investigation made by the senate committee on education into the steel strike, two bills have been reported favorably to the senate, the enactment of which supporters think would prevent the recurrence of such a strike and would punish seditious acts against the government. One measure is the Americanization bill introduced by Senator Kenyon, chairman of the committee on education and labor. While Americanization bills have been before congress for some time, the one reported favorably through Senator Kenyon consists of parts of the various bills that were before his committee and he is urging quick action on it.

The other bill was reported favorably from the senate committee on judiciary by Senator Sterling, a member of that committee, as well as of the committee on education and labor. Senator Sterling has been aroused by the seditious utterances and threats which have been made by agitators in connection with the steel strike and expects his bill, if enacted, to prove an effective curb on them.

The purpose of the Americanization bill is to consider a program of Americanizing illiterates and those unable to speak, read or write the English language. The committee report says:

"The theory of the bill is the process of stimulating the states to adopt compulsory teaching of English to illiterates and to that great body of those in this country who cannot speak, read or write the English language. The money appropriated is apportioned by the secretary of the interior among the several states in the ratio provided by the bill, but it is not turned over to any state unless the state provides for the teaching of English at least 200 hours per annum to all residents who are citizens of the United States 16 years of age or over and under 21, and all residents of more than six months who are aliens 16 years of age or over and under 45. When we realize that there are practically 8,000,000 persons in this country above 10 years of age who cannot speak our language the seriousness of this problem is apparent. This will be the first step in correcting the situation."

The bill appropriates $5,000,000 for the fiscal year ending June 30, 1920, and $12,500,000 annually until the end of the fiscal year, June 30, 1923, and an additional sum equal to the balance unexpended of the appropriation for the last preceding fiscal year. Penalty for refusal to submit to the compulsory education is left to the several states to fix.

Would Bar Red Literature From Mails

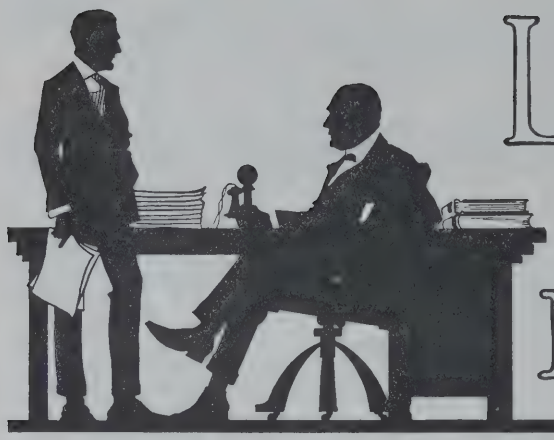
The bill of Senator Sterling makes it unlawful to advocate in any way the overthrow of the government, and would close the mails against all literature with that object in view. The bill also makes it unlawful to display at any gathering or parade any flag, banner, or emblem which means to symbolize the overthrow of the government of the United States.

Use of the mails for the transmission of the class of literature that is barred is punishable by a fine of $5000 or imprisonment for not more than five years or both, and in the case of an alien he shall upon the expiration of his sentence be deported from the United States and forever barred from re-entering it.

Both the house and the senate have adopted the conference report on the administration bill to exclude radical immigrants by extending federal power to limit the issuance of passports.

The senate committee on immigration also has ordered a favorable report on the house bill providing for the deportation and permanent exclusion from the United States of alien anarchists. At the request of Attorney General Palmer the senate is expected to enact this bill soon. It calls for the deportation of aliens interned during the war in addition to anarchists and also those convicted of violating the espionage, draft, explosives and other laws. Aliens making threats against the President also would be subject to the bill's provisions, which would make final any deportation decision of the secretary of labor. The bill affects four women and about 500 men interned as dangerous aliens.

Puddling Rate Unchanged



No change was made in the puddling rate as a result of the bimonthly wage settlement made Oct. 30 by representatives of the middle western bar iron manufacturers and the Amalgamated Association of Iron, Steel and Tin Workers at their meeting in Youngstown, O. The adjustsame as in the case of the past three settlements. Following is the averment price was 2.50c which entitles the puddlers to $12.38 a ton, the age price of bar iron on which wage settlements have been based during the past three years:

	1919	1918	1917
January-February	3.10c	3.10c	2.35c
March-April	2.75c	3.30c	2.45c
May-June	2.50c	3.35c	2.65c
July-August	2.50c	3.40c	2.75c
September-October	2.50c	3.45c	2.85c
November-December	2.50c	3.45c	2.95c
Yearly average	2.64c	3.34c	2.65c

Union Admits Union Shop Means Closed Shop

The Master Pattern Makers' association of Boston and vicinity, 70 of whose members are on strike, has informed the jobbing pattern manufacturers that, in addition to the demands originally made, if the strikers win all nonunion workers in the 12 shops affected will be required to join the union within 10 days or be discharged. The manufacturers consider this statement as in direct conflict with the position taken by Samuel Gompers, president of the American Federation of Labor, that a union shop is not necessarily a closed shop, a point which he sought to impress on the senate committee which investigated the steel strike, and later on, the national industrial conference. The original demands were made in August and included an 8-hour day for five days, and four hours for Saturday; double time for overtime, and a minimum wage of $1 an hour. The shops are running with reduced forces and the employers are being assisted by the Employers' Association of Eastern Massachusetts, and the Boston branch of the National Metal Trades association.

The Jeffrey Mfg. Co., Columbus, O., has taken out group life insurance with The Travelers, effective Oct. 25, covering its 2200 employes. The plan of insurance is unique. The increment of the insurance is $100 a year up to and including the fourth year when an amount of $800 is attained. For the fifth year the amount jumps to $2000 and then increases $100 per year to an amount of $4000. The whole plan is retroactive.

Little Stories of Business Life

On Common Ground

NO DOUBT can exist that Chairman E. H. Gary of the United States Steel Corp. is greatly interested in the government suit to dissolve it, arguments on which were made before the Supreme Court recently. Nor can it be doubted that Assistant District Attorney C. B. Ames is as greatly interested, but each has decidedly opposing views on the matter. But they have one thing in common in which they seemed to be more interested—baseball. Both showed themselves during the suit to be ardent fans, and, what is more, if any one thought Judge Gary was neutral as between the Reds of Cincinnati and the White Sox of Chicago, in the championship series then in progress, that doubt was dissolved emphatically, one dissolution Judge Gary did not oppose. He was for Chicago, perhaps because of past associations with that city, but at any rate, he showed himself to be consistently against the Cincinnati reds.

It was immediately after the court had adjourned that Judge Gary, who had listened to arguments presented in behalf of the corporation by General Counsel R. V. Lindabury, went up to and was talking to him about the case. Judge Ames, who stood several feet away, soon was handed a sheet of paper. It then turned out that the sheet of paper was the score of the game in the world series for that day.

"I am sure Judge Gary would be more interested in this than in the suit," said Judge Ames to a court attache after reading the score, as he handed it to the latter with the request that the same be shown to Judge Gary.

"Great!" exclaimed Judge Gary as he looked at the score and smashed his right fist into the open palm of his open palm of his left hand and turned to Judge Ames.

It showed the score in the sixth inning was 4 to 1 in favor of Chicago, and later proved to be final.

Cutting it Short

WILLIAM L. SAUNDERS, presiding at the welcome home dinner given by the Society of Mining and Metallurgical Engineers to Herbert Hoover at the Waldorf Astoria hotel in New York, Sept. 16, recalled this amusing incident at a dinner of a mining institute in Michigan:

"A speaker, looking over a familiar audience, began by saying: 'Now you know what I am going to say.' A large part of the audience cried out: 'Yes.' Whereupon the speaker said: 'Well, as you know what I am going to say, I shall not take your time by saying it.' He then sat down. Called to his feet again he repeated his statement: 'You know what I am going to say.' There were loud cries of 'no'. He then said: 'Well those people in the audience who know what I am going to say please tell those who do not and save time for the next speaker.'"

Mr. Saunders continued to say that the logical thing for him to do was to follow the advice of his Michigan friend, inasmuch as Mr. Hoover was the next speaker on the program. The committee in charge of the dinner would not listen to such an argument, and Mr. Saunders proceeded to pay Mr. Hoover a compliment for his work in behalf of humanity.

The Utopian Union

SOMETHING new in labor organization recently was called to the attention of Secretary of Commerce Redfield, when he received a telegram from the Loyal Legion of Loggers and Lumbermen, Portland, Ore. According to the telegram to the association, which includes 40,000 members, "is the first attempt to bring an entire industry under the advanced idea of labor and capital having an equal voice in all matters involving questions of hours, wages, living conditions, etc." It seems the employers and employes have equal representation on all boards and committees, and expenses of the organization are equally divided between the two groups.

The telegram asked the secretary to see that the organization is represented in his council. Mr. Redfield was somewhat puzzled over the object sought, but concluded the legion meant to ask representation in the conference President Wilson called for Oct. 6 when representatives of capital, labor, manufacturers, farmers, etc., meet in Washington to help solve labor problems. Secretary Redfield congratulated the legion on the success it has had in the eight months of its existence—the claim was made that no strike had taken place in the camps and mills since the organization was formed—and urged the members to ask the President for a chance to be heard at the conference.

Apples From Nails

PROBABLY the demand for old fashioned wrought-iron cut nails may be revived as a result of experiments which have been conducted by fruit growers in the Pacific northwest. A prominent grower in the panhandle of Idaho finds that he is able to increase the yield from his Siberian crab-apple trees nearly 1000 pounds per tree by driving cut nails into the trunk. Steel nails do not seem to achieve the same results. It is well known that there is some iron in apples and apparently this variety of tree has the ability to dissolve some the metal from the nails

driven through the bark, forming iron compounds which are utilized in producing the fruit.

A Safe Investment

A RECENT letter addressed to the *New York Tribune* and signed "Member of the Public" suggests a counter proposal to the railroad brotherhood's proposition that the public go into its pocket for 20 billion dollars at 4 per cent, buy the railroads and give them as a present to the trainmen.

Since the trainmen assert that they can operate the roads to advantage and can put a nice piece of profit in their pockets, let the trainmen buy the railroads and then make that profit on their own investment, says the correspondent. They number two million men and if each man puts up $10,000 either in cash or credit, the sum is 20 billion dollars and the railroads are theirs. Four per cent on $10,000 is $400 a year. It will take only $400 from each brother, yearly, to make his group the owner of the railroads. They assert that under their management the profits would be so great that when they were divided half and half with the public the trainmen would each receive from $600 to $900 bonus for his skill. This $600 bonus yearly would pay the $400 interest bill that each man has assumed. If his bonus reaches $900, it would pay the interest and principal in about 15 years.

In other words, if the figures offered by the trainmen are correct, the trainmen could buy the railroads on credit and pay for them out of the property's earnings. The railroads would be theirs in 15 or 20 years without costing the men a penny. That is about as cheap as anything is purchased these days. If they don't take up this proposition, it shows they don't believe in it themselves, at least not the extent of risking $400 on it. And if the trainmen are too "foxy" to risk a few dollars on their own scheme, why should the public come in to the tune of 20 billion dollars, asks the writer.

One Trooper Enough

AS UPHOLDERS of law and order, it is doubtful if there exists anywhere in the world a body of policemen who have less acquaintanceship with the word "fear" than the Pennsylvania state constabulary. They do not lack confidence in themselves either, as may be gathered from a little incident in connection with the steel plant strike.

It seems that the constabulary are stationed in groups of about half a dozen at certain strategic points in the troublesome areas in charge of a sergeant and keep in touch with various parts of the district by telephone.

The sergeant of one of these groups received a call one day recently telling him that a riot had started at a certain point. He answered, "I'll send a trooper over right away."

"One trooper?" came back the voice on the telephone, "I said there was a riot over here."

"I know you did," replied the sergeant, "but you said there was only one riot."

Coal Becomes Coin

MANY mediums for barter and exchange have been used ever since man began to pay for life's necessities; everything from glass beads to metals. It is left, however, to the coal miners of Germany to make use of coal to pay for butter which Denmark is furnishing to them So-called "butter divisions" have been inaugurated in some of the coal mines in the Rhur district of Germany and 60,000 laborers have indicated their willingness to work overtime to produce sufficient coal to meet Denmark's butter bills. In several the overtime gangs work 12 hours out of the 24 instead of eight as heretofore.

Just Killed

YES, Americanization of the foreign element in steel mills would be a good thing," said a man connected with a large steel company one day during the recent steel strike in Washington when senators commented on the large number of nonenglish speaking men working in the mills. "As it is, many of them do not understand much English and most of that consists of cuss words. It makes me think of a story I heard not long ago, which may or may not be true.

"A 'Hunkie' had been run over and killed by a dinky engine in a steel mill yard. The coroner was holding an inquest and the witness was another 'Hunkie' who was nearby when the accident happened.

"'How did it happen?' inquired the coroner of the 'Hunkie.'

"He gave his version of the affair as follows:

"'No ding-ding; no choo-choo; no "dam it, get out of the way." Heem just killed.'"

Union Meant Everything

WHILE not lacking a humorous side, little stories are in circulation in the Pittsburgh district in connection with the steel strike that furnish grounds for serious thought among some employers of labor whose "heads have been up in the clouds" with regard to such of their unskilled employes as have had neither the good fortune to have been born in this country or to have enjoyed its educational advantages. Neglected to a large extent by those giving them employment, they naturally have fallen easy prey to the deceptive doctrines preached by the I. W. W. and bolshevist agitators. The need of a strong Americanization movement among foreign workmen is forcibly brought home by the story of a Tarentum, Pa. physician, published recently in the *Pittsburgh Gazette-Times.*

This doctor asked a striking foreigner what he expected to do when his money ran out. The striker replied, as he produced a union card:

"Me catch 'em union card—go to grocery store—show union card; get on train—show Mr. Conductor union card."

Interrogated as to where he received the information he might use his union card in these ways, the foreigner is alleged to have said, "Mr. Union Boss, he tell me that."

In the Shenango valley, some of the foreign strikers, picketing a plant which was able to retain a sufficient number of men to keep going, were asked what they wanted and why they were hanging around. They replied they did not know what they were doing, but had been ordered to stay around the plant in question from midnight until 6 o'clock in the morning by the union boss. And so it goes. All the onerous tasks are imposed on the ignorant foreigner, fed up on utopian doctrines, while the English-speaking organizer sits safely at union headquarters.

Seek National Industrial Court

Society of Industrial Engineers in National Convention Urge President to Establish Agency With Powers to Enforce Decisions—Business Leaders and Experts on Human Relations Give Views on Labor Situation

AFTER discussing American and international labor conditions for three days, the Society of Industrial Engineers in convention in Cleveland last week wired a declaration to President Wilson urging the establishment of a governmental agency for the adjudication of industrial disputes, with power to enforce its decisions. The declaration stated that "labor disputes must be made justiciable," that is, liable to trial, and subject to decision beyond appeal, which would give the governmental agency supreme authority.

Further, the industrial engineers declared that "industrial unrest will be done away with only when a national purpose backs a proper remedy." Speaking at the concluding session of the convention Friday night, Rowland B. Mahany, assistant to the secretary of labor, stated that paragraph was the crux of the entire situation.

Tells Why Conference Failed

The engineers said the President's industrial conference failed because it limited discussion to methods instead of considering fundamental principles. The President was asked to appoint on the new conference members of the industrial engineering profession.

"The workingman reads and is told of vast accumulations in the hands of a few," said George E. Roberts, vice president, the National City bank, of New York, in speaking on "The Causes Underlying Industrial Unrest." "It is said that 2 or 3 per cent of the people own most of the wealth. He hears of personal incomes that are far beyond the needs of any man or family, and he thinks of these as meaning deprivation to the wage-earning class. The right way to measure the distribution of wealth is not by ownership or income but by consumption. It is only as an individual consumes wealth or uses it exclusively that he deprives other people of it.

"We talk about capital and income in terms of money, but money is only the medium of transfer. Wealth actually exists in the form of tangible property and in discussing distribution it is better to think of it as people use it. And right here is where nine-tenths of the misunderstanding over the distribution of wealth arises. The right place to measure the distribution is not at the point of ownership, or production, but at the point of consumption. The great consuming public is the chief beneficiary from increasing production.

"And when you come to measure distribution in this manner you get a result very different from the representations commonly made. Two or 3 per cent of the population do not consume most of the food supply, or wear most of the clothing, or burn most of the coal, or occupy most of the houseroom, or do most of the riding on the railroads, or even own most of the automobiles. The vast commerce of this country and traffic upon the railroads is not in supplying the wants of 2 or 3 per cent of the population. It is no small section of the population that is behind the great trade going on all over this country today.

"The whole theory that a comparatively few people enjoy most of the benefits of existing wealth breaks down completely under examination. The fact is that, in proportion to the total social product the share consumed by the rich is insignificant. The large incomes go back into industry to increase production for the public market, and the benefits inure mainly to the public."

Industrial Engineers Propose Remedy

WE, THE Society of Industrial Engineers, assembled in national conference and representing this profession in the United States, after thorough analysis and discussion, believe that we are by training, experience, ability and industrial relations justified in making the following declaration in regard to the present industrial situation:

1. *We declare industrial unrest will be done away with only when a national purpose backs a proper remedy.*

2. *We declare that the President's industrial conference just closed failed because it did not consider fundamentals and principles but discussed methods and mechanism.*

3. *We declare that labor disputes must be made justiciable, and governmental legal machinery set up to adjudicate such disputes with full authority to enforce its decisions.*

4. *We regret no industrial engineers were appointed on the President's industrial conference just closed, and we respectfully request that industrial engineers be appointed on the second President's industrial conference about to be called together.*

Feiss Critisizes Miners

Paul L. Feiss, president, Cleveland chamber of commerce, and a delegate to the national industrial conference, condemned the action of the coal miners' leaders in failing to heed President Wilson's request to delay the strike until an impartial tribunal could make an inquiry. He said:

"We have heard a great deal in this country about people being pro-British, pro-French, or pro-German but the real trouble is we are getting to be too pro-Russian. The men of the coal industry have taken a stand and adopted a policy in line with the triple alliance of workers in England, which is a form of extreme socialism and spells bolshevism. Such disturbances are born of the idea fostered in England during the war that the limiting of output is of benefit to the workers.

"I grant that one of our greatest duties is Americanization, but it seems to me that we are indicting ourselves, when after two years during which there has been practically no immigration we must still differentiate between workers by referring to some as foreigners and to others as Americans. We have not attained the proper degree of speed in assimilation, and by this I do not mean the teaching of the foreigner to speak English and to live in accordance with American customs but in giving him a sound knowledge of American principles. We need the backing of every municipality and state in addition to the federal government in this important work.

L. W. Wallace, president of the society, and who is general manager of the Red Cross Institute for the Blind, Baltimore, engaged in training the blind in industrial pursuits, read a paper entitled "The Industrial Engineers' Opportunity Through Contact with Labor."

"Some form of industrial democracy on one hand and a league of nations on the other unquestionably will be agencies of great value and influence, but those agencies within and of themselves will not eliminate labor troubles nor make future wars impossible," he said.

"In recent weeks we have heard much about the efficacy of industrial democracy, of shop committees, of the senate-and-house plan and of collective bargaining as panaceas for

labor problems. During the same period we have had striking examples of the inadequacy of all of these plans. Industrial democracy is a misnomer unless fairly and honestly applied. Collective bargaining is a great danger if wrongly applied and is used as an instrument of autocratic power.

"The problem before the American public is to evolve those plans and to inaugurate those principles that will make arbitrary and autocratic power a grave offense against the community and to make it impossible for any such arbitrary power to evoke its wrath against the will and welfare of the masses. Such plans should provide severe and just punishment for the autocratic employer or autocratic labor leader who wilfully violates the principles of honesty, fairness and justice and by such violations bring hardships, despair and heartaches upon the masses. One is just as guilty as the other; we have had glaring examples of the evils of the financial trust and of the labor trust. Both are equally culpable and both should be dealt with in like manner."

Dorr E. Felt, president of the Illinois Manufacturers' association, who was a member of the commission which investigated labor conditions in Europe in the spring of 1919 for the United States department of labor, described those labor conditions. The radical labor leaders in England for some time past have painted lurid pictures of impending revolution "provided the employers do not yield to the demands of labor," according to Mr. Felt. They have told the public that they, as the leaders of labor, alone could prevent the threatened disasters. Then they have made a pretense of "saving the nation," and by adroit political methods have won the applause of the people for their "patriotism."

"The failure of employers to understand what labor wants is what creates a labor problem," said Meyer Bloomfield, of Boston, a writer on labor subjects. "If you agree with that then we come to the great obstacle in solving the labor problem, which is the getting of facts, the truth of the situation. The executive, removed from his men, out of touch with their wants and thoughts, depends on his representatives, the little bosses, for his facts. Until the little boses are given more intelligence the men who work in your employ must go elsewhere for sympathy and understanding. If based on the truth humanities will take care of themselves."

Cannot Deal With Masses

"What we need in America today is: First, less untruthful publicity in regard to the labor situation; second, more truthful publicity, and third, a realization that we cannot deal with workmen as a mass," declared W. A. Grieves, assistant secretary, The Jeffrey Mfg. Co., Columbus, O.

"When we realize that the individual is the important factor in industry we will have gone a long way toward the solution of industrial problems.

"When we consider the small percentage of our industries which are involved in labor troubles we must appreciate the fact that the agitators cannot undermine our institutions or overthrow our fundamental ideas of government.

Mr. Grieves referred to the steel strike saying: "The wages in the iron and steel industry are high compared with those in other industries. There was no trouble except what the agitators attempted to bring about."

Women "Outstripping" Men

D. G. Stanbrough, general superintendent, Packard Motor Car Co., told of some of the methods used by the Packard company to meet the shortage of labor. Shop trade schools were established to train employes, classes were established for foremen, and women were given an opportunity to learn trades.

"We were hard up for stripers; and there were just 35 of them in Detroit, or at least we thought so," he said. "It took a striper eight hours to stripe a car. We started to train women; found we could train them to do the work in 10 days, and since then we have found the women can do the same work as the men in four hours."

The restriction of immigration, he declared, would do the industries of this country much harm.

H. C. Parmelee, editor, *Chemical and Metallurgical Engineering,* who recently returned from an engineering and industrial investigation in England and France, gave an interesting description of industrial conditions in those countries. Incidentally, he mentioned the fact that a Belgian lace factory, seeking to rehabilitate itself, found it could not get into production short of six or eight months if it imported its machinery from the United States, but that it could obtain the machinery from Germany within two months. Germany obtained the order. He ventured the opinion that the Germans under their new form of government will outstrip "the other countries" in industry and commerce. He reviewed the immigration situation and said that it was up to the United States "to clean house" of European malcontents.

W. H. Lough, president, Business Training Corp., New York, made an address on "Developing Teamwork Through Developing Team Leaders," while W. S. Warfield, Kansas City, Mo., president, Order of Sleeping Car Conductors, presented a paper on "Increased Efficiency, a Prime Factor in Higher Wages." Joseph W. Roe, secretary, Railway Car Manufacturers' association, read a paper on "College Training for Executives."

While the society concentrated its attention on the labor situation it heard several speakers who are experts on engineering problems related to industrial management.

Vladimir Karapetoff, professor of electric engineering, Cornell university, spoke on "Audible Signals in Factory an Aid to Efficiency." Professor Karapetoff is a talented musician in addition to being an expert on electric engineering, and he told how his "ear" for music helped him in experimental work. He demonstrated how in a factory where piercing noises predominate, a low-toned, sonorous and musical note will arrest attention, and where the noise is deep and thunderous, a shrill, piercing note will be heard. Various kinds of signals may be used in different departments of works, all connected with a central switchboard.

Ward Harrison, engineer associated with the National Lamp Works of the General Electric Co., spoke on "Lighting for Production." From an actual shop test a firm increased its production 27 per cent with an increase of only 5 per cent of its payroll. The spoilage due to poor lighting in Wisconsin alone is estimated at $500,000 annually. Twenty-four per cent of 91,000 accidents analyzed by the National Safety council were due wholly or in part to poor lighting.

Industrial Expert Speaks

Major Frank B. Gilbreth, Providence, R. I., spoke on "Unnecessary Fatigue, the Multibillion Enemy of America." He is a consulting expert on industrial problems who served the government during the war and who is now engaged by a number of large industrial concerns. He demonstrated how a multiplicity of physical strains incidental to everyday work may be easily abolished, making for speed, accuracy and general efficiency of the workers. He said the elimination of unnecessary fatigue would save 20 cents a day per worker, and that on a basis of 35,000,000 workers for 300 days a year, $2,100,000,000 could be saved annually.

Some of these papers will be presented more fully in subsequent issues of The Iron Trade Review.

Nearly 1000 were registered for the convention, and the delegates visited a number of the large industrial establishments in Cleveland. A feature of the convention was an exhibition of labor-saving and efficiency devices.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

THE Rochester Forge, Inc., Rochester, N. Y., organized last spring, has completed and has in operation its new plant, located in the northwestern part of that city on a siding of the New York Central railroad. The plant is housed in a building 50 x 80 feet, which is of steel construction, with metal sidings. The tract is of ample size to permit of considerable additions to the present building, as the business of the company may demand.

The company specializes in rings, disks, die blocks, spindle forgings and other such products as come within the classification of steam hammer work. Initial equipment of the plant consists of one 3500-pound double leg, and one 1500-pound single leg hammer, furnished by the Chambersburg Engineering Co., Chambersburg, Pa., power for which is provided by a 250 horsepower waste heat type vertical boiler, furnished by the Wickes Bros. Co., Saginaw, Mich. The furnace equipment comprises two heating furnaces and a heat treating plant built by Tate, Jones & Co., Inc., Pittsburgh, which also did the engineering work in connection with the layout of the boiler and furnaces. This equipment is coal fired, but has auxiliary equipment for oil fuel.

Officials of the company are: President, W. H. Kline; general manager, E. O. Jenkins; sales manager, E. E. Guntert. They are backed with a working organization of men who have had wide experience in the production of steam hammer forgings.

* * *

ORGANIZED to take over the manufacturing interests of the Barber-Foster Engineering Co., Friendship, N. Y., the American Crane Co., Inc., will build and market cranes, developed by the company first named. Barber-Foster company, 602-603 Swetland building, Cleveland.

* * *

ERECTION of a 1-story plant addition is progressing for the Cogsdill Mfg. Co., 818-820 West Warren avenue, Detroit, according to S. A. Cogsdill, president. This building is the outgrowth of a new combined center drill and reamer, which was recently developed by the company's engineers. According to Mr. Cogsdill, this tool is ground after hardening, with radial relief cutting edges.

* * *

WITH stock issued and outstanding of $78,750, the Edoscope Mfg. Co., Plainfield, N. J., is a new $200,000 corporation that is occupying part of a plant at 34 Somerset street. It manufactures and sells an automatic stereopticon and at present utilizes a small amount of equipment.

* * *

UNDER the firm name of Jenkins & Knowles, H. E. Jenkins, Hartford, Conn., and Elmer J. Knowles, Worcester, Mass., have opened an office and shop at 34 Wells street, Hartford, specializing in power installation in factories and power plants. They also will do a general electrical business.

* * *

FOR the purpose of increasing its output of marine motors, of the 2-cycle type from two to 10-horsepower, and 4-cycle type up to 30-horsepower, the Gilmore Marine Motor Corp., Detroit, recently filed articles of incorporation. The firm has added a brass and iron foundry to its plant.

* * *

DEPARTMENT of chemical research conducted by the Connecticut Metal & Chemical Co., at present located in New Britain, Conn., is to be transferred to a new plant in East Berlin, Conn., as soon as work is completed remodeling several factory buildings. Some of the buildings now are being equipped with machinery. A new 300-foot building also is being erected to house the chemical research department.

* * *

ERECTION of a new plant for the Phenix Tube Co., Brooklyn, N. Y., at Warren, O., will be started shortly, but contrary to a general report, the completion of this building does not mean the removal of the entire plant from Brooklyn, A. J. Burden, vice president, states. When the new buildings at Warren are completed, the manufacture of oxyacetylene welded steel tubing will be discontinued at the Brooklyn plant, and this product will be manufactured exclusively at Warren. At the Brooklyn plant the manufacture of iron-lined, lock-joint brass tubing, used principally in the manufacture of brass beds, will be continued.

* * *

CONTRACTS for varying tonnages of its special reinforcing steel bars have recently been closed by the Paul J. Kalman Co., St. Paul and Chicago, as follows: 1500 tons for blast furnace for the Ford Motor Co., Detroit; 660 tons, for grain elevator, Southwestern Milling Co., Kansas City, Kans.; 300 tons for building, American Brake Co., St. Louis; 275 tons each for building, Central Bag Co., Chicago, and for Plaisance hotel, Math. Rauen Co., Chicago; 200 tons each for school building, Buehl, Minn., and hotel and theater building, Hamm, Finkelstein & Ruben, St. Paul; 125 tons for warehouse, the Carton Co., Battle Creek, Mich.; 114¼ tons for warehouse and garage, Pence Auto Co., Fargo, N. Dak.; and 100 tons for school building, Kinney, Minn.

* * *

CAPITALIZED at $5,000,000, the Gottschau Steam Motors Co., Chicago, recently was incorporated in Delaware and is now completing plans for active operations in the production of steam automobiles. The company has leased a factory on Western avenue, Chicago, which will be used as an assembling building until a manufacturing plant can be built and equipped. The Stanley Carriage Co. has entered into a contract with the new firm, whereby it can manufacture cars of the same design as turned out by the Stanley company. A contract also has been entered into with the Residum Burner Co. which grants the new firm the use of the Residum burner for all automotive purposes. The incorporators of the company are: Christian M. Gottschau, J. H. Nash, superintendent of the Motive Power Illinois railroad; Otto Rabe, president of the Kelsey Foundry Co., Chicago; E. H. Lehr, president of the Investors Securities Co., Denver, and Mason R. McKinstry, secretary-treasurer of the Investors Securities Co. The principal offices of the company are at 1770 Berteau avenue, Chicago.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

FULL payment for the H. R. Lewis Tool Co., Detroit, has been made by F. R. Fortune, Wooster, O., and the property is being removed to that city. A new company has been incorporated for $200,000, known as the F. R. Fortune Tool & Mfg. Co., and the business will be conducted on a larger scale than formerly was the case. A 195 x 286-foot site has been donated to the company by the Wooster board of trade, which also will pay the company a bonus. A 1-story building, 60 x 180 feet, is to be built immediately and other units added. It is expected that the new plant will be ready for occupancy by Jan. 1 and in the meantime the Detroit plant will continue in full operation. A contract to build a railroad switch to serve the Wooster plant soon will be let. R. K. Evans, formerly works manager of the Lewis company is to continue in a similar capacity for the Fortune company. Joseph Lowenstein, who has been a toolmaker for 35 years, will have charge of the latter company's development work. The products of the plant will consist of machinists' and toolmakers' tools, automobile tools, etc.

* * *

ROST, ANGSTMAN & GRIESS, INC., 1778 Broadway, New York, will act as selling agents and sales engineers in the automotive field, handling engines for pleasure boats, commercial boats and their auxiliaries, as well as passenger car and auto truck parts. The company recently was incorporated with $50,000 capital. N. G. Rost is president.

* * *

COMPLETE new drop forging equipment, including modern machinery for die sinking and forging has been installed by the Bacon & Matheson Forge Co., successor to the Westerman Iron Works, Whatcom avenue and West Lander street, Seattle. So far as the company knows it is the first drop forge plant on the Pacific coast. C. H. Bacon is president.

* * *

THE American Instrument Works, Pittsburgh, incorporated July 10 last, has succeeded to the business of the Pittsburgh Instrument Co. The works of the company, which is under the management of Earnest A. Schurk, are located at 18 Lacock street, north side Pittsburgh, and manufactures tools, jigs, dies, machine parts and scientific instruments.

* * *

PRESENT capacity of the plant of the Empire Axle Co., Dunkirk, N. Y., will be nearly doubled by the erection of an extension. The addition will be equipped with modern machinery and tools as well as electric cranes and other labor saving equipment. The present power house of the company also will be enlarged. R. W. Foley is sales manager.

* * *

CAPITALIZED at $10,000, the Sprague-Hayes Mfg. Co., 40-42-44 Larned street east, Detroit, recently was incorporated to engage in the manufacture of machine tool specialties. According to advices from the company, it does not contemplate the erection of a plant at this time. Officers are: President, E. W. Sprague; vice president, Fred Heal, and secretary-treasurer, R. F. Hayes.

* * *

LITTLE evidence of the strike is apparent at the Woodlawn, Pa., works of the Jones & Laughlin Steel Co. In fact, the plant is setting up records. On one day recently, 1756 tons of steel passed through the blooming mill in a 12-hour turn, which is record for this mill and is believed to be the greatest tonnage ever broken down in one turn of any mill in the country.

* * *

THE Columbia Tinware Co., Inc., 82-90 Scholes street, Brooklyn, N. Y., which was recently incorporated with $20,000 capital, according to advices from Samuel Antoville, secretary, is now actively engaged in the manufacture of tinware, galvanized and japanned ware. Officers are: President, Julius Levett; treasurer, Joseph Manoff, and secretary, Samuel Antoville.

* * *

INCORPORATION of the Donoghue Machine Co., New York, recently was effected and the company will engage in the manufacture of pistons, piston rings, piston pins and do general crankshaft grinding. Officers of the company are: President, Joseph Donoghue; treasurer, Joseph Donoghue; secretary and general manager, Herman Koch, and mechanical engineer, Edgar N. Zorn. The office of the company is at 239 West Sixty-eighth street, New York.

* * *

CONTRACTS have just been closed by C. F. Herington, district manager at Chicago for the Bonnot Co., Canton, O., to furnish the preparing and distributing pulverized coal system, built by that company to the following companies: The Marion Malleable Iron Works, Marion, Ind.; Grand Rapids Malleable Iron Works, Grand Rapids, Mich., and the Franklin Steel Works, Franklin, Pa.; the latter contract includes the installation of 1700 horsepower boilers.

* * *

THE Rockrange Iron Works, Inc., Suffern, N. Y., recently was organized to engage in the fabrication and erection of structural steel and ornamental iron work. The company has purchased a site, 50x205 feet, which is improved with a 2-story building. New machinery has been purchased and is now in transit. Operation of the plant is expected to be started about Dec. 1. The company, which is capitalized at $50,000, was incorporated by W. H. Pavitt, A. Gruenwald and M. Hineser.

* * *

EXPORT orders for complete tinning machines, which include tin pots, conveyors, and branning and polishing units, have been received by the Aetna Foundry & Machine Co., Warren, O. Part of this equipment was ordered through New York dealers for French interests and part through San Francisco dealers for shipment to Japan. So far as is known, these tinning machines are the first American-made units to be shipped to foreign tin plate makers since before the war. Important inquiries from French and Japanese sheetmakers for galvanizing machines also are before the officials of the Aetna company.

British Output Declines Sharply

Multiplicity of Strikes Affecting Iron and Steel Industry Brings Threat From Government to Call a Halt—American Steel Imported at Higher Figure Than Domestic Cost to Meet Urgent Needs—Germany and Belgium Making Inquiries

Bureau of THE IRON TRADE REVIEW,
Prince's Chambers, Corporation Street,
Birmingham, Eng., Oct. 7.

Rate of Exchange 4.17

LARGE importations of finished iron and steel from America are beginning to have their sequel in British returns, as the September figures include 10,000 tons of American billets with 5150 tons of finished steel. The billets cost nearly £14 ($58.38) per ton, c.i.f. This figure is rather significant, since at this price, with the prevailing rate of exchange American steel cannot be competitive with British, and the purchases must be to meet urgent needs, practically regardless of cost.

The severe blow inflicted by the railroad strike on the iron and steel industry is becoming more apparent. The chief trouble is still on the railroads. Rolling stock is chronically deficient; breakdowns are frequent and it is clear that many of the engines ought to be scrapped. Many of the mills were only kept going by storing their output and some of the accumulations were enormous. It is impossible now to get cars with the requisite promptness.

Railroad traffic seems to be unmanagable, while there are rumors that some of the railroad men are accepting substantial gratuities to give certain establishments preference in the supply of cars. Apparently railroad disorganization will be a serious obstacle to business for many months. The iron and steel industry in the Birmingham district is in a better position than works elsewhere, as much of the Black country output is for Birmingham requirements, and the Midland city is linked up to the works with canals, or can be served with iron by motor trucks. In the Sheffield district business is nearly paralyzed by the deficiency of cars.

In the Black country, although mills were kept going with few exceptions during the strike, output continues deficient. Hope of wage concessions from the men to assist the manufacturers to meet foreign competition has now disappeared. Although in the early days of the war the employers frequently anticipated the upward movements of the sliding scale by voluntary wage advances, there is an entire absence of any inclination to reciprocate now that the employers' turn has come to ask for relief. There is still a good demand for iron, almost wholly for home consumption. For the time being the foreign trade in iron is dead.

Galvanized Sheets Advanced

The only advance recorded this week is in galvanized sheets, which have been put up to £33 ($137.61), admittedly a high figure. Makers in the Birmingham district could sell twice as much, if they had the skilled workmen to restart the idle mills. The trade continues to be crippled by the operation of the 8-hour system, which not only reduces the output per shift, but wastes enormous quantities of coal in the intervals between day and night operations.

Steels are firmer with an increasing demand. Fairly good sales of billets have been made at £15 5s ($63.59), but steelmakers generally restrict their sales to small tonnages. A number of merchants have received circulars this week putting up steel prices 10s ($2.80) per ton, and it is thought likely that this advance has become general.

There is a remarkable disappearance for the time being of foreign importations of steel. The few lots from Lorraine proved rather unsatisfactory, as they were too hard for most British requirements and repeat orders are unlikely. But there is some evidence that this steel was sold with the object of getting ready money, and that it was more urgently needed at home. The same is equally true of Belgium, and this is confirmed by a Belgian inquiry this week addressed to a Birmingham merchant for supplies of billets over several months at the rate of 15,000 tons per month.

Another steel strike has begun, with its center in Scotland, where the bricklayers at the Clyde steel works are out, stopping or very largely restricting operations, with the result that the Clyde shipbuilders are faced with a prospective stoppage of steel supplies much needed for shipbuilding.

Less business is passing in Welsh tin plates, chiefly because nearly all the mills are booked months ahead. Inquiries from the Continent are enormous and among earnest purchasers are Germans who would take large quantities if credit could be arranged. Makers of iron and sheet bars in that district are fully booked to the end of the year.

The pig iron industry is far from normal, and practically defies any sort of forecast. A number of furnaces are still out, some definitely stopped for repairs, and others damped down. Smelters are not in a hurry to restart, in view of the indifferent prospects as to obtaining fuel, and the extreme uncertainty as to business.

Demand for the better grade pig iron has been greatly reduced by the molders' strike, which has stopped a great many of the largest foundries in the kingdom. The first ballot of the molders to decide the question of returning shows a majority opposed. The great engineering shops are gradually becoming affected, as reserve castings are used up, increasing unemployment. The strike has been in progress for nearly a month.

Some foundries are buying as usual, glad of the opportunity of stocking iron. Prices are unaffected, reduced output being balanced to some extent by a falling off in demand. Under the new conditions of sale, which involve conditional clauses passing on to the consumer any additional costs of production, buyers do not see any particular advantage in speculating on contracts, so that they merely contract to secure a reserve of iron to cover needs for a week or two. This helps to steady prices.

The extensive stoppage in Middlesborough has removed any prospect of iron made in that district going into Northamptonshire and Derbyshire, so that eventually the prices in the latter districts may be hardened a little. In the West coast district all but two furnaces damped down during the strike of coal miners and railroad men have been put into commission again, but demands for low phosphorus iron have decreased considerably, almost wholly in consequence of the molders' strike. Hardly any business is going on in spiegeleisen or ferromanganese, and the two furnaces at Workington usually employed in this business are idle.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

ISAAC W. FRANK, president of the United Engineering & Foundry Co., Pittsburgh, since its organization in 1901, retired from that position with the company at the annual meeting held at the company's offices last week. Mr. Frank, however, is not severing his connection with the company, which he will continue to serve in the capacity of chairman of the executive board. Florence C. Biggert Jr., for several years past chief engineer and second vice president of the company, succeeds Mr. Frank as president and K. C. Gardner, former manager of sales of the rolls department, has been chosen to succeed Mr. Biggert as second vice president. Charles H. Booth, of the Lloyd-Booth Co. department, Youngstown, O., retired from the board of directors of the United company, his place being filled by the election of John Quinn, manager of the American Roll & Foundry Co. department, Canton, O. Other officers and directors of the company were re-elected.

Mr. Frank's retirement from active participation in the affairs of the United Engineering & Foundry Co., is merely the fulfillment of an oft-repeated intention, founded upon a desire for more leisure and an opportunity for travel to which the next year will be devoted. Mr. Frank was one of the organizers of the United company, having been previously part owner of the Frank-Kneeland Machine Co., now one of the United constituent companies. He was elected president of the company at its organization, on July 1, 1901, and served in that position continuously until his retirement. He is a graduate of the Renssalaer Polytechnic institute, Troy, N. Y.; has been active in business and civic affairs in Pittsburgh and also was president of the National Founders association and prominent in the affairs of the National Metal Trades association. He is a member of the American Iron and Steel institute as well as a member of many clubs and organizations.

John E. Cushing, who has been assistant director, succeeds J. H. Rosseter who resigned, effective Nov. 1, as director of operations of the shipping board. Mr. Rosseter has retired to resume his work with the International Mercantile Marine and W. R. Grace & Co., with which companies he was associated for many years.

C. K. Sheridan on Nov. 1 became purchasing agent at Cleveland for M. A. Hanna & Co., Leader-News building, Cleveland, sales agent for iron ore, pig iron, coal and coke. He succeeds T. F. Cadden.

A. W. Mellon, of the Mellon National bank, Pittsburgh, and Eversley Childs, chairman of the Barrett Co., New York, recently were elected directors of the Crucible Steel Co. of America, Pittsburgh.

ISAAC W. FRANK

J. F. Paige, general manager of the Port Arthur Shipbuilding Co., has resigned to take charge of the Halifax Shipyards and will assume his new duties in November. He formerly was associated with the Fore River Shipbuilding Co., Fore River, Mass.

M. L. Murray has resigned as branch office manager for the Waterbury Co., 15 Murray street, New York City, and has been elected vice president and general sales manager of the Alloy Metal Wire Co., which has established temporary offices at 146 West Ninety-ninth street, New York City. The wire mills of the latter company are at Yonkers, N. Y.

Harry P. Reichard has been elected secretary of the Aetna Iron & Steel Co., Gary, Ind., recently incorporated at $3,000,000. He formerly was identified with the United States Steel Corp., that city, prior to which time he was located in Columbus, O.

W. H. Farrell has been named to represent the Wykoff Drawn Steel Co., Pittsburgh, in New York and New England. Mr. Farrell is a brother of James A. Farrell, president of the United States Steel Corp. and a pioneer in the wire drawing business.

George M. Thompson, formerly vice president of the Clinton-Wright Wire Co., Worcester, Mass., was elected president and general manager at a special meeting of the directorate, held Oct. 27. He succeeds Evan F. Jones, resigned. John Wheeldon, formerly of Cleveland, was made general superintendent. For the past year, Mr. Wheeldon has been with the Spencer Wire Co.

L. Sevier, vice president of the Sloss-Sheffield Steel & Iron Co., Birmingham, Ala., who will be succeeded on Nov. 1 by Hugh Morrow, prominent attorney, has been elected president of the Alabama Manufacturers and Operators association. He will give his entire time and effort to the association. He will make special effort to handle some of the export business that is looming up for the Alabama producers.

Lewis P. Smith has been placed in charge of the new office established in New York City by Matthew Addy & Co., Cincinnati. He formerly was in the Philadelphia and Cincinnati offices of the company and during the war served in the pig iron division of the war industries board. Mr. Smith will handle the sale of pig iron, coal, coke, ferroalloys, fluor spar, etc., in the New York and New England territories. He has established temporary quarters at 27 William street, New York, but shortly will open a permanent office at another address.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

FLORENCE C. BIGGERT JR., who succeeds Isaac W. Frank as president of the United Engineering & Foundry Co., Pittsburgh, was born in Crafton, Pa., about 43 years ago. He was graduated from the University of Pittsburgh with the degree of mechanical engineer in 1899 and that fall entered the employ of the United Engineering & Foundry Co., as a draftsman and subsequently rose to the position of assistant chief engineer. He succeeded Frank I. Ellis as chief engineer when the latter resigned to accept another position. For the past few years he has been second vice president of the company. He took a prominent part in the designing and building of the rail and billet mills at Gary, Ind., has been active in developing steel plant equipment and is widely known for his original ideas in this line of work. He is a member of the American Society of Mechanical Engineers, the Engineers' Society of Western Pennsylvania, the American Iron and Steel institute, and the Union club, Pittsburgh.

F. J. Page has been placed in charge of the Chicago office of the Milwaukee Electric Crane & Mfg. Co., 604 Fisher building.

Milton O. Dean, assistant agent of the Pepperell Mfg. Co., Biddeford, Me., has resigned to become agent of the Edward Mfg. Co., Augusta, Me.

Joseph G. Butler Jr., Youngstown, O., vice president of the Brier Hill Steel Co., has opened his art museum on Wick avenue, that city, in which he has housed his beautiful art treastures, including 81 large canvasses.

C. W. Knox, who for several years has been associated with the United States Steel Products Co., Seattle, has resigned to accept a position with the Continental Pipe Mfg. Co., of that city. Mr. Knox will be in charge of sales for the latter company.

W. A. Gatward, engineer of the Hoskin Mfg. Co. ,Detroit, presented a paper on "Industrial Application of Nickel Chromium Alloys," at the bimonthly meeting of the metallurgical and mining section of the Engineers' Society of Western Pennsylvania at the Union Arcade auditorium, Pittsburgh, last Tuesday evening.

B. H. Gardner, for the past two years manager of the New Britain district of the Connecticut Light & Power Co. has been promoted to be sales manager of the commercial department of the company with headquarters in Waterbury, Conn. N. S. Franklin, assistant superintendent, has been promoted to succeed Mr. Gardner.

Lewis Marshall Ream, Thompson, Conn., who for several years has been

FLORENCE C. BIGGERT JR.

learning the wire business at the Worcester, Mass., works of the American Steel & Wire Co., has gone to Cape Town, South Africa, to represent the United States Steel Corp. in a sales capacity. Mr. Ream is a son of the late Norman B. Ream, Chicago, who was a director of the Steel corporation.

W. J. Clucas has been appointed manager of the Detroit office of the Lancaster Steel Products Co., Lancaster, Pa. Increased demand and the opening of the Detroit office made necessary the appointment. Mr. Clucas was connected with the Standard Parts Co., Cleveland, many years. The Lancaster company will also increase its Detroit facilities by establishing a warehouse.

Robert L. Wilkinson has been appointed sales manager of the Klaxon Co., Newark, N. J., to succeed Walter P. Coghlan, who recently resigned to go to Baltimore. Mr. Wilkinson has been with the Klaxon organization for 10 years. In Chicago he handled jobber interests. Later he went to Indianapolis in charge of the motor equipment business for that section, and then to Chicago with an enlarged territory. When the Klaxon industrial division was organized with headquarters in the Metropolitan tower, New York, Mr. Wilkinson was transferred to New York, where he has been identified with the organization until his latest promotion to sales manager. He will be located at Newark.

John W. Higgins, president and treasurer of the Worcester Pressed Steel Co., Worcester, Mass., was re-elected a vice president and member of the executive committee of the Associated Industries of Massachusetts at its fourth annual meeting in Boston last week. Winslow Blanchard, of the Blanchard Machine Co., Cambridge, Mass., was re-elected assistant treasurer and a member of the executive committee. In addition the following were elected members of the executive committee: Charles L. Allen, president and general manager of the Norton Co., Worcester, Mass.; George Bausman, National Equipment Co., Springfield, Mass.; Lewis E. Bellows, Walden-Worcester, Inc., Worcester, Mass.; Howard Coonley, Walworth Mfg. Co., Boston; James H. Drury, Union Twist Drill Co., Athol, Mass.; Adolph W. Gilbert, Chapman Valve Mfg. Co., Indian Orchard, Mass.; S. Harold Greene, Lockwood, Greene & Co., Boston; Eben S. S. Keith, Keith Car & Mfg. Co., Sagamore, Mass.; Fred T. Ley, Fred T. Ley & Co., Inc., Springfield, Mass.; Frederick H. Payne, the Greenfield Tap & Die Corp., Greenfield, Mass.; Richard H. Rice, the General Electric Co., Lynn, Mass.; E. Kent Swift, the Whitin Machine Works, Whitinsville, Mass.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

ALBERT H. MITCHEL, who formerly was affiliated with the Taft-Pierce Mfg. Co., Woonsocket, R. I., has become vice president and general sales manager for H. W. Cotton, Inc., Woolworth building, New York City, manufacturer of precision and automatic machinery, and designer and builder of jigs, tools with a plant at 34 Thirty-fifth street, Brooklyn, N. Y. His headquarters will be in the Woolworth building, New York City. For nine years, Mr. Mitchel was in the engineering department of the Taft-Pierce company at Woonsocket and then entered the sales department as Chicago representative. For the last five years, he has been district sales manager at its New York office.

Edward R. Abbott has become identified with the sales force of H. W. Cotton, Inc., Brooklyn, N. Y. He will have charge of western business but for the present will have his headquarters in the Woolworth building, New York City. He later will remove to Cleveland. Mr. Abbott formerly was a member of the sales force in New York for the Taft-Pierce Mfg. Co., Woonsocket, R. I., for several years.

Gustaf A. Granlund has been made superintendent of the Van Norman Machine Tool Co., Springfield, Mass.

Arthur L. Humphrey, president of the Westinghouse Airbrake Co., Pittsburgh, has been elected a director of the Western National bank, Pittsburgh.

William F. Dautrich, who has been with the Standard Co., a division of the Torrington Co., Torrington, Conn., several years has become general manager of the Borgeson Mfg. Co., Torrington.

George Roemer Woods, who recently resigned from the Allied Machinery Co. of America, New York, has been appointed manager of the New York office of R. S. Stokvi & Zonen, Ltd., Rotterdam, Holland. He has been touring Europe, visiting the various offices of the company at Paris, Brussels, Petrograd, etc., and has made a study of industrial and economic conditions. Early in November he will take up his duties at 17 Battery place, New York City.

R. W. Wolf, a New York engineer, will speak on the "Human Relation in Industry" at a meeting of the Worcester section, American Society of Mechanical Engineers, in Worcester, Mass., Nov. 20.

Howard R. Bemis, president and treasurer of the Bemis & Call Hardware & Tool Co., Springfield, Mass., has been elected a director of the Hendee Mfg. Co. of that city in place of C. O. Hedstrom, resigned.

H. L. Mode has been placed in charge of the New York office in the Woolworth building, established by the Chesapeake Iron Works, Baltimore, manufacturer of electric traveling cranes.

John B. Anderson, assistant manager of the Brockton Gas Light Co., Brockton, Mass., has resigned to engage in business in Worcester, Mass. He is president of the Brockton chamber of commerce.

Allen F. Smith, who has been with the Carlton Engraving Co., Worcester, Mass., several years and is the secretary of the Advertising club of Worcester, has become advertising manager of Walden-Worcester, Inc., maker of wrenches, of that city.

F. O. Wells, president of the Greenfield Tap & Die Corp., Greenfield, Mass., who recently returned from Europe, gave an illustrated talk on the battlefields which he visited, before the Engineering club of the corporation, Oct. 27.

Capt. H. L. Wyman, U. S. N., assistant industrial manager at the Portsmouth navy yard, Portsmouth, N. H., for the past three years, is to be detached from duty at that station this month, and will be succeeded by Capt. Charles P. Snyder.

Frank G. Phegley has resigned his position with Warren Webster & Co., Camden, N. J., manufacturer of water heaters, steam specialties, etc., after nine years as manager of its Cleveland office, 706 Rose building. Hereafter it will be under the direct management of the home office but Clyde W. Colby has been appointed Cleveland district manager and he will have associated with him as assistant district manager, William Roebuck Jr., who has been identified with the company's home office organization for the past nine years.

Herman Fleischer, one of the factory managers of the Stanley Works, New Britain, Conn., completed 50 years of service in the factory, Oct. 29, and was presented with a gold watch and $50 in gold by his associates. He is the oldest man, in point of service, in the factory.

Harry E. Penfield, who has been manager of the Worcester Machine Screw Co., Worcester, Mass., a branch of the Standard Screw Co., since last December, has been transferred to the Hartford Machine Screw Co., Hartford, Conn., another branch of the Standard Screw Co., effective Nov. 1.

Fred P. Gates, who has resigned from the Arrow Electric Co., Hartford, Conn., to go with the Hart Mfg. Co., maker of electrical switches, in that city, was given a farewell dinner, Oct. 31 by the Foremen's club, of which he was president, and presented with a watch, suitably inscribed.

Frederick G. Hausmann has been appointed production manager of the P. & F. Corbin division of the American Hardware Corp., New Britain, Conn., to succeed James R. Fletcher, who died recently. Walter J. Sorrow, superintendent of the plant department of the Winchester Repeating Arms Co., New Haven, Conn., will take entire charge of the mechanical end of the division.

George D. Munson, Wallingford, Conn., has been elected first vice president of the International Silver Co., Meriden, Conn., to fill the vacancy caused by the recent death of George H. Edwards, Bridgeport, Conn. I. W. Copefair and L. B. Hall, both of New York, have been elected second and third vice presidents, respectively. Roy C. Wilcox has been elected a director in place of Mr. Edwards and C. R. Gardiner has been elected a member of the executive committee.

To "Squeeze" Out War Inflation

Federal Reserve System Will Raise Rates For Rediscounting on "War Paper" to Level of Commercial Paper Rates—Hope to Bring About Deflation of Huge War Expansion—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

EXPECTED announcement by the federal reserve banks within a very short time that the rates for rediscounting member bank bills on "war paper" collateral are to be raised to the level of commercial paper discount rates, will constitute the first official postwar step to reduce the tremendous volume of war-created inflation of bank credits in the United States.

This credit expansion, as described by Governor Harding of the federal reserve board, "is equal to the difference between the total war expenditures of the government, on the one hand, and on the other, the total amounts raised by the government through taxation and by the sale of its obligations so far as paid out of savings." He adds that no reliable estimate can be made of this difference, which must be gradually absorbed through future savings for the reason that banks are lending and will always lend freely on government bonds as collateral.

An estimate of the government obligations held by the banks of the country as security for loans places the total at between $6,000,000,000 and $7,000,000,000. In view of the preference that has been granted "war paper" borrowings by the federal reserve banks speculation has been rife respecting the future policy of the system at the expiration of the period of one year, tacitly agreed upon at the time of the Fourth Liberty loan campaign. At that time it was found necessary to urge investors to "borrow and buy," the banks undertaking to carry such loans for customers for four 90-day renewals at the coupon rate. For the Victory loan the banks were to carry loans for the period of six months.

The four 90-day renewal period for Liberty bonds has expired and for additional renewals of loans by customers, banks are charging an increased rate of 5 per cent instead of the lower coupon rate. The Victory loan period expires Nov. 11. The federal reserve system has been standing behind the member banks by rediscounting their notes based on "war paper" collateral at 4 per cent for 15-day maturities and 4¼ per cent for 90-day maturities.

The opening of the gates of the federal reserve system to the flood of "war paper" was in direct violation of the fundamental principles upon which the system was built. Its operations were designed to be confined to self-liquidating paper, such as acceptances, commercial paper, etc. Only the exigencies of the war and the imperative need for facilitating the huge financing program of the government caused the system to be changed to admit such long term securities as government obligations as a basis for rediscounting.

To Eliminate War Paper

Bankers are convinced that until all of the "war paper" is squeezed out of the system and it reverts to its proper peacetime function, the country's financial position will not be completely sound. At a meeting of the officials of the 12 regional banks in Washington last week it is understood that decision was reached to raise the rediscount rates on "war paper." How effective this action will be in "squeezing" out the war inflation from the banking situation is problematical.

The effect, of course, will be to push such collateral out of the reserve system itself, but the member banks will likely be compelled to make loans to customers on their bonds for a long time to come. There is no doubt but that the ease of obtaining loans from banks on bonds and the low rate has encouraged such borrowing by bond holders, and the stiffening of the rates doubtless will inject a healthy element of restraint and discouragement into the situation. Inflation is being caused not only by borrowing to pay for undigested bonds, but by borrowing on bonds already paid for by the investor. As most bonds have by now been practically digested the latter factor is the most serious.

The result of wholesale borrowing on bonds has been extravagance and the bidding up of prices in countless lines. Some economists contend that the circulating credit of the country has been increased to the extent of the bonds outstanding, and it is indisputable that most bond holders think of their bonds as assets rather than a debt which they and all the people must some day pay. The speculative wave has been due to the war inflation in a large measure.

The peace burden on the federal reserve banks has been more severe than that of the war. Last week's statement of the reserve board shows that discounts of bills secured by government war obligations were $1,666,055,000 as compared with $1,092,417,000 for the corresponding date one year ago. The ratio of total reserves to net deposit and federal reserve note liabilities combined, last week stood at 48.7 per cent as compared with 54.6 per cent one year before. This is but 8.7 per cent above the legal minimum ratio. The currency situation has shown some tendency toward deflation, however. Total money in circulation had decreased from $5,129,985,000 of Dec. 1, 1918, to $4,796,890,000 Aug. 1, 1919. The per capita circulation had fallen between those dates from $48.13 to $45.16, a decrease of $2.97 per capita.

Carbon Steel Plans to Enter New Fields

New equipment installed and improvements made by the Carbon Steel Co., Pittsburgh, within the last year will permit the company to enter new fields using sheets bars and forgings, according to the statement of President Charles McKnight, in the annual report for the year ended Sept. 30. The company during the year spent for permanent improvements, extensions and replacements, $1,198,561 of which $621,319 has been charged to property accounts and the balance to reserves made to cover the cost of extraordinary war facilities. In addition, $207,751 has been charged off for depreciation.

The report states that the $507,264 spent during the year to maintain the physical condition of the plant has been charged to operating expenses. Principle improvements include a forge department for the

manufacture of both light and heavy forgings; a 32-inch jobbing mill; five new Sterling boilers; and machines for cutting auto axles.

Referring to the labor situation the report asserts that operations were swiftly regaining prewar proportions when the present strike became effective. Pointing out that in the past, efforts had been concentrated upon improving working conditions and that no demands have ever been made as to grievances, it is concluded that the walkout was agitated entirely by outsiders.

The report states that the bonus plan for the benefit of officers and employes of the company, inaugurated in 1917, was continued during the year just ended. The comparative income account follows:

	1919	1918
Net profits	$5,193,345	$3,767,063
Adjustments	166,783	.....
Depreciation	207,651	192,845
Dividends	730.000	880,000
Taxes	3,225,000	2,081,029
Premium and charity	17,650	21,100
Extensions	.....	100,000
Surplus	846,261	492,088

The balance sheet shows cash on hand amounting to $3,030,273 and accounts and bills receivable of $1,099,186. Inventories as of Sept. 30 were $1,134,092. Real estate, plant and equipment totals $6,810,864.

Allis-Chalmers Net Falls

The Allis-Chalmers Mfg. Co., Milwaukee, earned net profits after federal taxes of $916,309 for the third quarter ended Sept. 30. This compares with net profits of $926,945 in the preceding quarter and $1,170,296 in the corresponding quarter of 1918. Unfilled orders on hand Sept. 30 amounted to $14,542,704 as against $32,382,335 one year before. The comparative statement follows:

	1919	1918	1917
Sales billed	$7,557,683	$6,212,290	$6,287,064
Net profits	*916,309	*1,170,296	†919,404

*After deduction of federal taxes. †Before federal taxes.

Takes British Loan

The United States Steel Corp. has purchased $10,000,000 of the new 5½ per cent United Kingdom loan of $250,000,000. It also will become a participant in the underwriting with the banking interests to the extent of another $10,000,000. This action follows the adoption of a similar course by a number of large corporations at the time of the Anglo-French loan in 1915. The United States Steel Corp. was a heavy subscriber and the Bethlehem Steel Corp. subscribed to $25,000,000. The present subscription by the Steel corporation brings the value of Liberty bonds and other securities it holds to a total value of nearly $300,000,000. Chairman Gary, of the Steel corporation, in announcing the present subscription said:

"We believe these securities will be first class in every respect and a desirable investment. Also, we think it is decidedly to the interest of the United States as well as Great Britain that purchases of this character be made by Americans at this particular time. This should have a marked influence toward the restoration of normal rates of exchange and the bettering of the financial and commercial relations between the two countries, and therefore of advantage to the entire business situation."

National Acme Net Less

Net profits available for dividends of the National Acme Co., Cleveland, for the third quarter were $858,161, as against $1,514,333 for the corresponding quarter one year before. The company is paying dividends of 6 per cent or $3 per share on the $25,000,000 stock and at the rate of last quarter's profits, the earnings were on an annual basis of 13.7 per cent per share. The comparative statement follows:

	1919	1918
Net sales	$3,533,390	$3,928,560
Net profits	858,161	1,514,333
Dividends paid	375,000	375,000
Surplus for quarter	483,161	1,139,333

Foreigners Selling U. S. Steel Stock

Investment holdings of United States Steel Corp. common shares are increasing according to the latest report which shows 2,972,511 shares in the hands of investors as of Sept. 30, as compared with 2,920,860 three months before. Brokers' holdings aggregated 2,110,514 as against 2,162,165 shares at the end of the second quarter of 1919. Brokers' holdings of preferred stock also showed a decrease in the third quarter, falling from 325,646 to 316,235 shares; investment ownership showing a corresponding gain for this class of stock. On Sept. 30 brokers held 8.78 per cent of the aggregate preferred and 41.52 per cent of the total outstanding common stock.

Foreign liquidation of American stock is indicated by the further decline of foreign holdings shown in the report. On Sept. 30 foreigners held 394,543 shares of common of 7.76 per cent of the total, as compared with 465,474 shares or 9.15 per cent three months ago. On June 30, 1914, the foreign holdings of the common totaled 25.07 per cent of the whole. Largest holdings abroad are in England where there are 169,175 shares. At the end of the second quarter Holland held 210,525 shares but at the end of the third this had dwindled to 145,858 shares.

Steady Prices

Are Ruling in Coal By-Products—Ammonium Sulphate is Scarce

New York, Nov. 3.—Although supplies of some descriptions are scarce, prices in the coal tar products market remain steady. Pure benzol is holding at 24 to 29 cents and 90 per cent material at 22 to 24 cents. The heavy buying noted during the summer months, has subsided, although spot supplies are scarce. Demand for toluol and solvent naphtha also is somewhat slower; nevertheless, with production at a reduced rate, stocks are not accumulating. Toluol is quoted at 26 to 30 cents on spot and contract, and solvent naphtha at 22 to 27 cents.

Activity by drug merchants in covering their next season's requirements continues to feature the naphthalin market. The dye industry is also a factor in the present activity. Naphthalin in flakes is holding at 6½ to 7½ cents, and naphthalin in balls at 8½ to 9½ cents.

The scarcity of sulphate of ammonia is causing some hardship among buyers seeking nearby deliveries. This has resulted in relatively high prices being paid in some instances. However, the market still may be quoted for domestic business at $3.40 to $3.50 products' plants, and $3.50 to $3.75 on spot. Export business is quoted at $4 to $4.25, eastern seaboard. The latter are more or less nominal.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.50 to 3.75

Contract

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds Producers' Plants

Sulphate of ammonia	3.40 to 3.50

Eastern Tool Dealers Form Association

Definite form has been assumed by the association of some of the machine tool dealers in the east, the title of which is the Machine Tool Dealers' association of New York City. Officers have not as yet been selected but C. O. Dowding temporarily has been appointed chairman and his headquarters are located at 151 Lafayette street, New York City. The following are charter members: Manning, Maxwell & Moore, Inc., 119 West Fortieth street; Vandyck Churchill Co., 85 Liberty street; The Fairbanks Co., 416 Broome street; Dale-Brewster Co., Inc., 54 Lafayette street; Hill, Clarke & Co., Inc., 136 Cedar street; Barbour, Love & Woodward, Singer building; Frevert Machinery Co., 38 Vesey street, and Patterson, Gottfried & Hunter, Inc., 211 Centre street, all in New York City. Other machinery dealers are to be invited to become members.

To Build Sheet Plant

Chicago, Nov. 3.—The Aetna Iron & Steel Co., headed by C. E. Wirt, vice president of the National Bank of America, Gary, Ind., has bought 400 acres at Gary, Ind., formerly occupied by the Aetna Explosives Co. Preparations are under way for the erection of a sheet mill, 312 x 552 feet, in which will be installed six sheet mills with furnaces and a galvanizing department. The buildings are designed to add six more mills within a short time and further additions as circumstances warrant.

The plant will require two 30-ton cranes of 84-foot span, and one 10-ton crane of 40-foot span. A contract for the building is expected to be let within the next few days.

Announce New Plant

Official announcement has been made by the Follansbee Bros. Co. that Toronto, O., where the company has acquired 15 acres, will be the site of its new sheet and tin plate mill, to cost $3,000,000. Construction is stated to begin immediately.

The new plant will duplicate the present plant of the company at Follansbee, W. Va., except that it will be electrically driven throughout. It will consist of four 40-ton open-hearth furnaces, four side door ingot furnaces, one 1500 tons hydraulic press, one 30-inch reversing bar mill, while the finishing department will include four 50-inch, four 44-inch and two 40-inch sheet mills, each mill to have one stand of roughing rolls, 10 cold mills and 12 double anncaling furnaces.

The company has secured sufficient coal lands adjoining the mill site to provide sufficient coal for its operation. A realty company, a subsidiary of the Follansbee Bros. Co., will build 300 new houses for the employes of the new plant. These houses will be on a site just south of Toronto, in a section known as Jeddo. A model town will be laid out there and it is expected later will be incorporated with Toronto. Joseph Breslove, Oliver building, Pittsburgh, is consulting engineer in connection with the new plant.

Will Cast Cutting Tools

The United States High Speed Steel & Tool Corp., recently incorporated in New York with a capital stock of 150,000 shares, no par value, will manufacture high speed cutting tools of all kinds by a process of casting. The company has acquired all the assets and business of the High Speed Tools Corp., Toledo, O., and has also taken over a plant at Albany, N. Y., which will begin to operate shortly. The Toledo company had been turning out tools for about two years. The officers of the company are as follows: President, D. H. Friedman, president of the United Iron & Steel Co., Albany, and vice president of the Cohoes Rolling Mills, Cohoes, N. Y.; first vice president, V. V. Wolkerstein, formerly president of the High Speed Tools Corp.; vice president and plant manager, L. J. Ollesheimer, also formerly of the Toledo company; treasurer, Frank A. McNamee, a business man of Albany; and secretary, Robert C. Proskanzer, attorney; the foregoing, with Frank E. Howe, president of the Manufacturers National bank of Troy, N. Y., comprise the board of directors.

To Meet in St. Louis

The twenty-second annual convention of the American Mining congress will be held at St. Louis, Nov. 17-22, 1919. An effort will be made during this meeting to create a closer understanding between the employers and employes. Among the speakers already scheduled are: Francis S. Peabody, Chicago; R. Dawson Hall, managing editor, *Coal Age;* Senator Albert B. Cummins, author of the Cummins railroad bill; Dr. Van H. Manning, director, bureau of mines, Washington; Dr. George Otis Smith, director, United States geological survey; and Andrew Duffy, director of the safety division, United States railway administration.

Obituaries

FREDERICK W. WALLACE, general manager and treasurer of the Waclark Wire Co., Elizabeth, N. J., died on Oct. 30, at his home in Plainfield, N. J. He was ill but a few days, death resulting from pneumonia. Mr. Wallace was a graduate of Yale university, in the class as 1888, and was a member of the Scroll & Keys and the Plainfield, N. J., country club.

Charles N. McFarland, who has been general manager of the Jaxon Steel Products division of the General Motors Corp., Jackson, Mich., for some time, died in that city on Nov. 1, following an operation for appendicitis.

Peter J. Hamler, aged 51 years, founder and president of the Hamler Boiler & Tank Co., 3906 South Halsted street, Chicago, died Oct. 25 at his home. He is survived by his son, Jerome Hamler, who was associated with him in business.

George H. Noble, mechanic and inventor, employed for more than 50 years by the Brown & Sharpe Mfg. Co., Providence, R. I., died at his home in that city, Oct. 23, aged 78.

Fred W. Wallace, general manager and president of the Waclark Wire Co., Bayway, N. J., died Oct. 30 at his home in Plainfield, N. J., aged 55. He was a member of the class of 1888 at Yale university.

George Thomson Coppins, for 30 years secretary of the Walworth Mfg. Co., Boston, until his retirement several years ago, died at his home in Newton, Mass., Oct. 22, aged 74 years. He was a veteran of the Civil war.

Tool Market Survives Strike

General Iron and Steel Disturbance Interferes but Slightly With October Business of Machinery Sellers — Eastern Automotive Industry's Tool Demands Large—Crane Sales Numerous Despite Labor Troubles

BAROMETRIC as is the machine tool industry, it is significant that throughout the month of October, it was but little affected by the strike in the iron and steel industry. Some holding back of orders was done by certain manufacturers who were influenced by the uncertainty but on the whole, it can be said that sellers of machinery successfully have survived the first five or six weeks of the interference with general industry. At certain times in the month more orders were received than inquiries, but usually the reverse was true. Striking machinists in Akron, O., and elsewhere returned late in October and some equipment orders then were promptly released; some are yet to be issued. Unrest in Paterson, N. J., Bridgeport, Conn., and other toolmaking centers had its affect upon the market but this largely was nominal. While much of the month's business consisted of light equipment, sales of heavier tools were fairly numerous. The establishment of their own machine shops by various manufacturers in the Chicago territory, made for increased machine tool business for dealers.

Government-owned Machinery Sold Abroad

OFFERS of new and used machinery by the government and various companies formerly engaged on war work have made themselves more or less felt in the east during the past 30 days. Sellers believe however that the sooner this equipment is cleared away, the more healthy will the market become. The war department reported the sale of approximately 2500 machine tools to La Construction Metallique, a co-operative society of 500 industrial concerns of Belgium. This practice if continued will remove a large factor from the domestic market. Because of this sale abroad, it is stated that the Moline Plow Co., Moline, Ill., experienced some difficulty in obtaining its full requirements out of government-owned stocks, to replace the equipment damaged by fire of several weeks ago. The Remington Typewriter Co., Ilion, N. Y., however, bought 50 government-owned tools, it is stated, without difficulty.

Automotive Demand Spreads Eastward

MIDDLE WESTERN sellers of machinery have found a ready market in the automotive and allied industries for many months. This continues. It was noted during October, however, that this automotive demand is becoming stronger in the east. Purchases by the Willys Corp., Elizabeth, N. J., for the Duesenberg plant where it is building its new 6-cylinder car, include 10 special machines, 10 Norton grinders and 14 Newton slab millers. Since its announced expansion program contemplates the expenditure of $4,000,000, other large purchases are scheduled for early closing. The New Departure Mfg. Co., Bristol, Conn., is to buy $1,000,000 worth of tools. The North American Motors Co., Pottstown, Pa., bought $300,000 worth of machinery, and the International Motors Co., Allentown, Pa., will require a large amount for its $1,000,000 plant. The General Electric Co., Schenectady, N. Y., issued a list of 53 tools and the Parish Mfg. Co., Reading, Pa., bought a considerable number.

Unslaked demand for equipment continues among the automobile builders in the Cleveland and Detroit territories. The largest project is the new plant for the Fisher Body Ohio Co., Cleveland, which has been incorporated at $10,000,000. The Templar Motors Corp., Cleveland, is about to issue a list of $300,000 worth of machinery for contemplated buildings, and the Chandler and Cleveland Motor Car companies also are to make some heavy expenditures for buildings and equipment.

Miscellaneous Requests Are Heavy

VARIOUS lines of manufacturing effort again were heavily represented in the miscellaneous buying of the past month. Perhaps the largest inquiry was circulated by the American Car & Foundry Co., for its Depew, N. Y., Buffalo and Chicago plants, covering $100,000 worth of equipment. A. Bentley & Son, Toledo, O., issued a huge list of tools, approximating $1,500,000 in value for what is said to be a shipyard project. The E. W. Bliss Co., Brooklyn, N. Y., bought considerable heavy equipment, as did the Youngstown Pressed Steel Co., Youngstown, O. The Wehrle Co., Newark, O., stove manufacturer, issued a list of 26 tools and bought several. The Detroit Lubricator Co., Detroit, bought 19 lathes and screw machines in Cleveland. The Ohio Collieries Co., Toledo, O., asked for prices on five tools while the Stevens Motor branch at Freeport, Ill., of the Moline Plow Co., bought $6000 worth.

Longshoremen's Strike Lowers Exports

EXPORTERS of machinery report splendid business in the Straits Settlements, Dutch East Indies and other territories in the Far East. The longshoremen's strike, however, is holding back many shipments abroad. Data supplied during October, showed a continued falling off in August of machinery exports of $591,676 to $3,849,143, which was a little less than 50 per cent of the high level for June. C. H. Coulier, 25 Church street, New York City, issued a list of 125 tools for locomotive and car repair shops in South America. Shibakawa & Co., 120 Broadway, New York City, asked for prices on 100 tools for an automobile plant in Japan.

Many Cranes Sold Despite Steel Strike

BUILDERS of cranes while not affected from the manufacturing end, suffered from the sales end of their business from the steel strike. Most of their customers are found among the various iron and steel plants of the country. However, some sizable sales were made; seven went to the Firestone Steel Products Co., Akron, O., and a like number to the Kennedy Van Saun Mfg. Co., New York. McIntosch & Seymour, Auburn, N. Y., and the Harley Co., Springfield, Mass., each closed on four and the Leffel Mfg. Co., Springfield, O., bought three. Several firms bought two cranes each.

Inquiries not yet closed include one for 59 chain hoists from ½ to 20 tons for shipment to Japan, issued by the Trans-Continental Merchants, Inc., New York; one for eight cranes for export to South America by C. H. Coulier, New York; one for five cranes for the Hugh Nawn Contracting Co., that city, and one for several overhead cranes for M. W. Kellogg & Co., Jersey City.

Tool Buyers Revive Inquiries

Effects of Steel Strike Wearing Off—Coal Strike Influence Not Noted as Yet—Dodge Bros., Perfection Heater and Firestone Tire & Rubber Issue Large Lists—Single Crane Inquiries Fairly Numerous

PARAMOUNT as is the coal strike among economic influences of the hour, machine tool sellers believe they will weather this storm as successfully as they have the steel strike, which now is crumbling steadily. Those manufacturers who because of uncertainties, held up equipment purchases, now are making urgent efforts to place orders for prompt delivery. A tendency to close quickly when requirements are located, now is noted. This is true in the Middle West especially.

While buying in the east is not especially active, many inquiries are out. The American Car & Foundry Co., New York, and the H. H. Franklin Mfg. Co., Syracuse, N. Y., both are large buyers. Dodge Bros., Detroit, have issued a comprehensive list; the Perfection Heater Co., Cleveland, is asking for about 20 tools, and the Firestone Tire & Rubber Co., Akron, O., has issued a list of 36 machines. Most sales are for smaller numbers of tools however, and inquiries asking for one, two or three machines especially are numerous at this time both in Cleveland and in Chicago. In the latter city, the Chicago, Burlington & Quincy railroad has revived its inquiry for 50 tools; the Samson Tractor Co., Janesville, Wis., continues to place orders as does the Nash Motors Co., Milwaukee. The International Harvester Co., Chicago, purchased four 21-inch turret lathes for its tractor plant. The F. B. Stearns Co., Torbensen Axle Co., Perfection Heater Co., Cleveland, all made purchases in their home town. The B. F. Goodrich Co., Akron, O., and the Goodyear Tire & Rubber Co., that city, have revived their inquiries as have a number of other companies, who held up purchases subsequent to the calling of the steel strike.

Reports from Canada indicate that a gradual improvement is taking place in the equipment industry, contributed largely by the automotive industries. The Chase Tractors Corp., Toronto, is expected to issue a fair sized list shortly. A new company has asked for 21 tools through the Chapman Ball Bearing Co., Toronto. The St. Lawrence Welding Co., Montreal, wants plate-working machine and garage equipment is desired by Wm. Munson, Tara, Ont. Machinery and equipment for a new factory is desired by the Acme Roofing Co., Walkerville, Ont.

Cranes are moving slowly, although practically all the activity in Pittsburgh is in connection with this class of equipment. The Blaw-Knox Co., Hoboken, Pa., bought three; the American Sheet & Tin Plate Co., and the American Steel Co., Ellwood City, Pa., each bought one. Further east crane inquiries mainly call for one each. They come from the Ellwood City Forge Co., Ellwood City, N. J.; Michigan Stamping Co., Detroit; Erie Foundry Co., Erie, Pa.; Commercial Steel Castings Co., Marion, O.; Weirton Steel Co., Weirton, W. Va.; Cleveland Rubber Mold Foundry & Machine Co., Cleveland; Elyria Steel Products Co., Elyria, O.; Standard Oil Co., New Orleans, La.; Viele Blackwell & Buck, New York; Atlas Portland Cement Co., Northampton, Pa. The Cerro de Pasco Copper Corp., New York is asking for two.

Lull Exists in Eastern Tool and Crane Market

WHILE considerable inquiry is out, buying in the eastern machine tool market is not especially active. Little is being done at the moment on the larger lists pending, and the placing of scattered business appears to be somewhat smaller. In some quarters, this disposition among buyers to hold off is regarded as the natural result of the acute labor situation now prevailing; in others, however, such influence is regarded lightly and the present lull is considered as being without much particular significance. That sentiment continues strong is reflected by advances of 10 and 20 per cent by one manufacturer on certain types of sensitive drills. No other advances have been noted during the past week, but some are expected.

Although some railroad buying has been reported in other sections of the country, the eastern market continues to be little affected. A small list has been recently closed by the Pennsylvania railroad, but other than this only an occasional tool has been purchased. The export situation remains largely unchanged, there being but little foreign business booked. One large buyer to begin closing on its list is the American Car & Foundry Co., which during the past few days has placed an order for eight radial drills. The H. H. Franklin Mfg. Co., Syracuse, N. Y., is also buying machine tools at this time.

New inquiry for cranes has been light, and awards have not been large. One contract calls for a 15-ton overhead crane, with 50-foot span, for the Ellwood City Forge Co., Ellwood City, N. J. It went to the Champion Engineering Co. This builder has also received recently contracts for a 10-ton electric crane, with 75-foot span, for the Michigan Stamping Co., Detroit; a 50-ton crane, with 10-ton auxiliary and 36-foot span, for the Erie Foundry Co., Erie, Pa.; a 10-ton crane, with 58-foot span,

Say you saw it in THE IRON TRADE REVIEW

for the Commercial Steel Castings Co., Marion, O.; a 15-ton crane, with 29-foot span, for the Weirton Steel Co., Weirton, W. Va.; a 5-ton crane, 46-foot span, for the Cleveland Rubber Mold Foundry & Machine Co., Cleveland; and a 5-ton crane, with 38-foot span, for the Elyria Steel Products Co., Elyria, O. The Cuba Railway Co. has purchased a 15-ton traveling crane for Cuba from the Whiting Foundry & Equipment Co.

Included in recent awards in the locomotive crane market is a 25-ton Browning crane for Viele, Blackwell & Buck, 49 Wall street, New York City. The crane is for domestic use. The Standard Oil Co. has bought a 15-ton oil burning locomotive crane for New Orleans. The Atlas Portland Cement Co., with purchasing offices at 30 Broad street, New York City, has purchased a 15-ton Brown Hoist crane for Northampton, Pa. The McLean Contracting Co., Baltimore, has bought a 25-ton used Ohio crane.

The Cerro de Pasco Copper Corp., 15 Broad street, New York., has placed two 20-ton overhead cranes with the Pawling & Harnischfeger Co. This order follows the recent award of two 10-ton and two 15-ton cranes to this company. The Cerro de Pasco company remains in the market for a special ladle crane of seven tons capacity. The King Paper Co., Kalamazoo, Mich., is inquiring for a monorail overhead system.

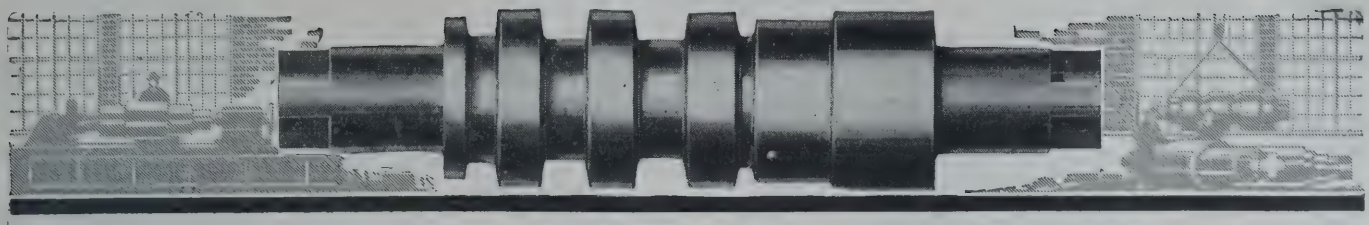
Splendid Tool Business Current in Canada

CANADIAN machinery and tool dealers report that business gradually is showing improvement and that the inquiry for several lines is brisk. The demand for tools for automobile plants heads the list and even greater activity in this line of equipment is anticipated. With this increasing demand, some deliveries are impossible this side of three to six weeks. The Chase Tractors Corp., Ltd., 28 Atlantic avenue, Toronto, Ont., will issue a list for its new addition. It is going over its present equipment, sorting out what can be made use of, the remainder of which will be sold. A new concern which is locating in Canada has asked the Chapman Ball Bearing Co., 347 Sorauren avenue, Toronto, to put it in touch with firms who are in a position to supply the following equipment: One each No. 0 and No. 2 Brown & Sharpe plain milling machine, 10 No. 00, four No. 0 and five No. 2 Brown & Sharpe automatic screw machines. The St. Lawrence Welding Co., 138 Inspector street, Montreal, Que., is in the market for power punch and shear to work ½-inch plate; also a set of power rolls, 10 to 12 feet long to roll ½-inch plate. William Munson, Tara, Ont., is in the market for equipment for a garage. The Acme Roofing Co., Walker road, Walkerville, Ont., is receiving prices on machinery and equipment for a new factory to be erected at once. Wm. Bonter & Sons, Mormora, Ont., is in the market for flour mill and grist mill machinery and equipment to be installed in mills to be erected immediately. Jules Caron, 69 St. Francois Xavier street, Three Rivers, is receiving prices on elevator equipment including one 45-horsepower electric motor; one 100-horsepower electric motor; grain separator and crusher, etc.

Small Sales Mean Fair Sized Aggregate Value

MOST of the new business in the Chicago machinery market continues to come in small lots, one important seller stating that his largest sale during the past week covered three pieces of equipment. At present prices, it does not require a heavy selling movement to bring the total to a high mark, measured in dollars. While railroads are not showing much interest in tools, an occasional indication is given that buying from this source may be expected when the railroads have been returned to private owners. The Chicago, Burlington & Quincy railroad is active now and has asked new bids on a list issued several months ago, covering about 50 tools. Whether this indicates a real desire to buy or simply to obtain an insight into the present market is not known.

The Samson Tractor Co., at Janesville, Wis., continues to add to its equipment and Nash Motors Co. is about to close for its new plant at Milwaukee. The International Harvester Co. recently purchased four 21-inch turret lathes for its tractor plant at Chicago. No particular change is taking place in prices, although an occasional advance of 10 to 15 per cent is made here and there. Deliveries are growing gradually more remote as new business exceeds production.



Several Crane Orders Taken in Pittsburgh

A FEW orders for cranes have been closed recently in the Pittsburgh district, but as a general proposition, machinery and tool business in that district has continued to be better in prospect than in actuality. Buyers generally are hesitant owing to the extremely unsettled labor situation and only such projects as cannot be put off are being closed. The Cleveland Crane & Engineering Co., Wickliffe, O., through its Pittsburgh office, recently closed with the Blaw-Knox Co., Hoboken, Pa., for two 10-ton, and one 20-ton 70-foot span, cranes. The Alliance Machine Co. Alliance, O., has been awarded a 15-ton trolley crane by the American Sheet & Tin Plate Co., but the plant of the latter company for which this crane is intended is not announced. The American Steel Co., Pittsburgh, has placed a 5-ton crane for its Ellwood City, Pa., plant with the Whiting Foundry Equipment Co., Harvey, Ill.

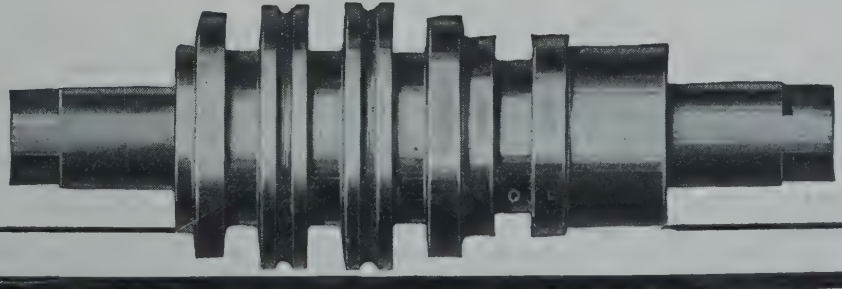
Although the Cambria works of the Midvale Steel & Ordnance Co. still are down as a result of the steel strike, a citizens' committee is making an effort to get the men to go back. If this move is successful, plant improvements involving expenditures of more than $10,000,000 will be resumed and this probably will be followed by a closing on equipment inquiries put out some time ago.

Three Fair Sized Lists Out in Cleveland

REVIVAL of old inquiries which were held up because of the steel strike as well as the issuance of several new lists are engaging the interest of machine tool sellers in the Cleveland district. Three of the latter class come from the Perfection Heater Co., Cleveland; the Firestone Tire & Rubber Co., Akron, O., and Dodge Bros., Detroit. The former company is equipping itself to manufacture its own parts instead of purchasing them for assembling and issued a list of about 20 machines, including Garvin duplex millers; multiple spindle drills; various drill presses and drills; Pratt & Whitney profiling machines; cutter grinders, etc. It has purchased a number of these. The Firestone Tire & Rubber Co. is asking for four 36-inch drill presses, back-geared, power feed with tapping attachments; three sensitive drill presses, ⅛-inch capacity drill; one spline miller equal to a 4-inch Pratt & Whitney; one 20-inch drill press, circular table, power feed with tapping attachment; one vertical tapper, ⅝-inch capacity; four 16-inch x 10-foot lathes with taper attachment and two without taper attachment; two No. 3 universal milling machines; two 24-inch shapers; one 6 x 6-inch power hack saw; one No. 6 screw machine, ⅝-inch capacity, belt driven; three wet grinders, 16-inch x

Say, Fella's—

I find there aint sich a H__ of a difference between men an' metal after all. The less there is in 'em, the more kick an' fuss they kin make, an' the better they are the easier to git along with. Take those HUBBARD ROLLS—good all the way through. Ya never hear a squeak or squawk out of 'em.



So Long,

Rolling Mill Jim.—

Hubbard Steel Foundry Co.

EAST CHICAGO, IND.

All Kinds of Iron and Steel Rolls and Steel Castings.

1½-inch wheels; 200-ton forging press; one 24-inch x 18-foot and one 30-inch x 20-foot lathe with taper attachment; one 8-spindle multiple drill press, ⅝-inch capacity; two 14-inch x 10-foot lathes with taper attachment, constant speed motor; two No. 4 plain milling machines; one 10-inch slotter; on 84-inch gear cutter; one 6-inch centering machine. Dodge Bros. are taking quotations on one 28-inch W. F. Barnes sliding head, one 23-inch Rockford stationary, one used 24-inch Cincinnati back-geared stationery head drilling machine; one used 16-inch x 6-foot Reed, two new 16-inch x 6-foot South Bend, one used 16-inch x 6-foot Leblond and one 14-inch x 6-foot Hendey lathe; two new Kempton No. 3 universal, one used No. 3 Brown & Sharpe, four No. 3 Kempsmith and one No. 3 Cincinnati universal milling machines; one 36 x 36-inch x 8-foot Gray planer; four No. 57 and four No. 666 Toledo power presses; one No. 2, four No. 4 and one No. 6 used and nine No. 2 new Warner & Swasey hand screw machines and one 24-inch Gould & Eberhardt shaper.

Smaller inquiries are so plentiful that dealers contrary to their usual custom find it unnecessary to go outside the immediate territory. The Goodyear Tire & Rubber Co., Akron, O., has revived its inquiry for about a dozen tools. The B. F. Goodrich Co., that city, still is looking for a boring mill and now is in the market for an 18-inch shaper. The Post Tractor Co., Cleveland, is asking for a horizontal boring mill. The P. A. Geier Co., Cleveland, is looking for an open side planer. The Urban Machine & Tool Co., Cleveland, which succeeds the Ohio Tool & Machine Co., and which is to specialize on a bench lathe, has bought a No. 3 plain milling machine and is in the market for a lathe. The Benedict Mfg. Co., East Syracuse, N. Y., is in the market for a 3½-inch stroke, 4000-pound punch press. The F. B. Stearns Co., Cleveland, has closed on the hammer it asked for recently. The Peerless Nut Co., that city, bought two nut tappers and the Torbensen Axle Co., that city, bought a drill press, and considerable government equipment and is understood to be in the market for some special machinery. Turner, Vaughn & Taylor, Cuyahoga Falls, O., want a planer.

An announcement of interest to equipment sellers is made by the Marsh Motor Car Co., W. T. Marsh, president, which is a reorganization of the Sterling Motor Car Co., Brockton, Mass. The new company has bought 100 acres in Cleveland, and construction has been started on the first unit of the plant, 200 x 500 feet, to cost $250,000.

Detroit dealers are informed that the Pressed Steel Co. of Canada, Ltd., Toronto, Ont., has started work on its Port Huron, Mich., factory and is making overtures for machine tools, as is the Wills-Lee Co., Marysville, Mich., which is building an automobile plant. Machine tools and other equipment are yet to be ordered by the Republic Carbon Co., Niagara Falls, N. Y., and a few drills, presses, etc., are required by the Western Steel & Iron Works, DePere, Wis., for its new 2-story building, 44 x 110 feet. Approximately $80,000 worth of machinery for its new 4-story building to be completed in the spring of 1920, is to be bought by the Reliance Motor Truck Co., Appleton, Wis., and possibly a similar amount will be required by the Acme Motor Truck Co., Cadillac, Mich., which is doubling its capacity. A new $500,000 building now being erected will double the output of the Bucyrus Steam Shovel Co., Evansville, Ind. The Davenport Machine Tool Co., Inc., Rochester, N. Y., bought a plant recently which was partly equipped; additional machine tools must be purchased.

Other building projects which give rise to expectations that equipment soon will be asked for are: Addition to plant, Fairmont Mining & Machinery Co., Fairmont, W. Va.; new plant, Huckabee Tractor Co., Texarkana, Ark.; 90 x 300-foot addition for the Franklin Tractor Co., Franklin, O.; 2-story, 80 x 200-foot plant, Anderson Foundry & Machine Works, Anderson, Ind.; plant, 180 x 215 feet, Gear Grinding Machine Co., Detroit; $70,000 addition for the Jackson Steel Products Co., Jackson, Mich.; 1-story, 168 x 290-foot addition for the Hamp Motor Car Corp., 1049 East Milwaukee avenue, Detroit.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

BOSTON.—The Beacon Rectifier Co., Inc., has been incorporated with $10,000 capital to make machinery, heating supplies, etc., by George Y. Young, William J. Henderson, Hyde Park, Mass., and M. L. Henderson.

CAMBRIDGE, MASS.—Penniman & James, 414 Main street, have awarded contracts for a manufacturing building and a machine shop, to cost $35,000.

HAVERHILL, MASS.—Plans are being prepared for a 5-story, 45 x 150-foot plant and a 1-story, 18 x 30-foot boiler house to cost $70,000 for the New England Wood Screw Co.

LAWRENCE, MASS.—The Mills Machine Co. has begun work on a machine shop, to cost $50,000.

LYNN, MASS.—The Whitcomb Pattern Co. has been incorporated with $10,000 capital, by Fred L. Foster, Albert E. Simpson and John T. Garner.

LOWELL, MASS.—The Gillespie Mfg. Co. has let a contract for a 2-story, 60 x 300-foot plant, to cost $50,000.

SPRINGFIELD, MASS.—The Tidewater Oil Co., New York, has let a contract for a plant to cost $40,000.

WARREN, MASS.—The Warren Steam Pump Co. has started work on plant additions, 1-story, 85 x 200 feet and 1-story, 40 x 60 feet.

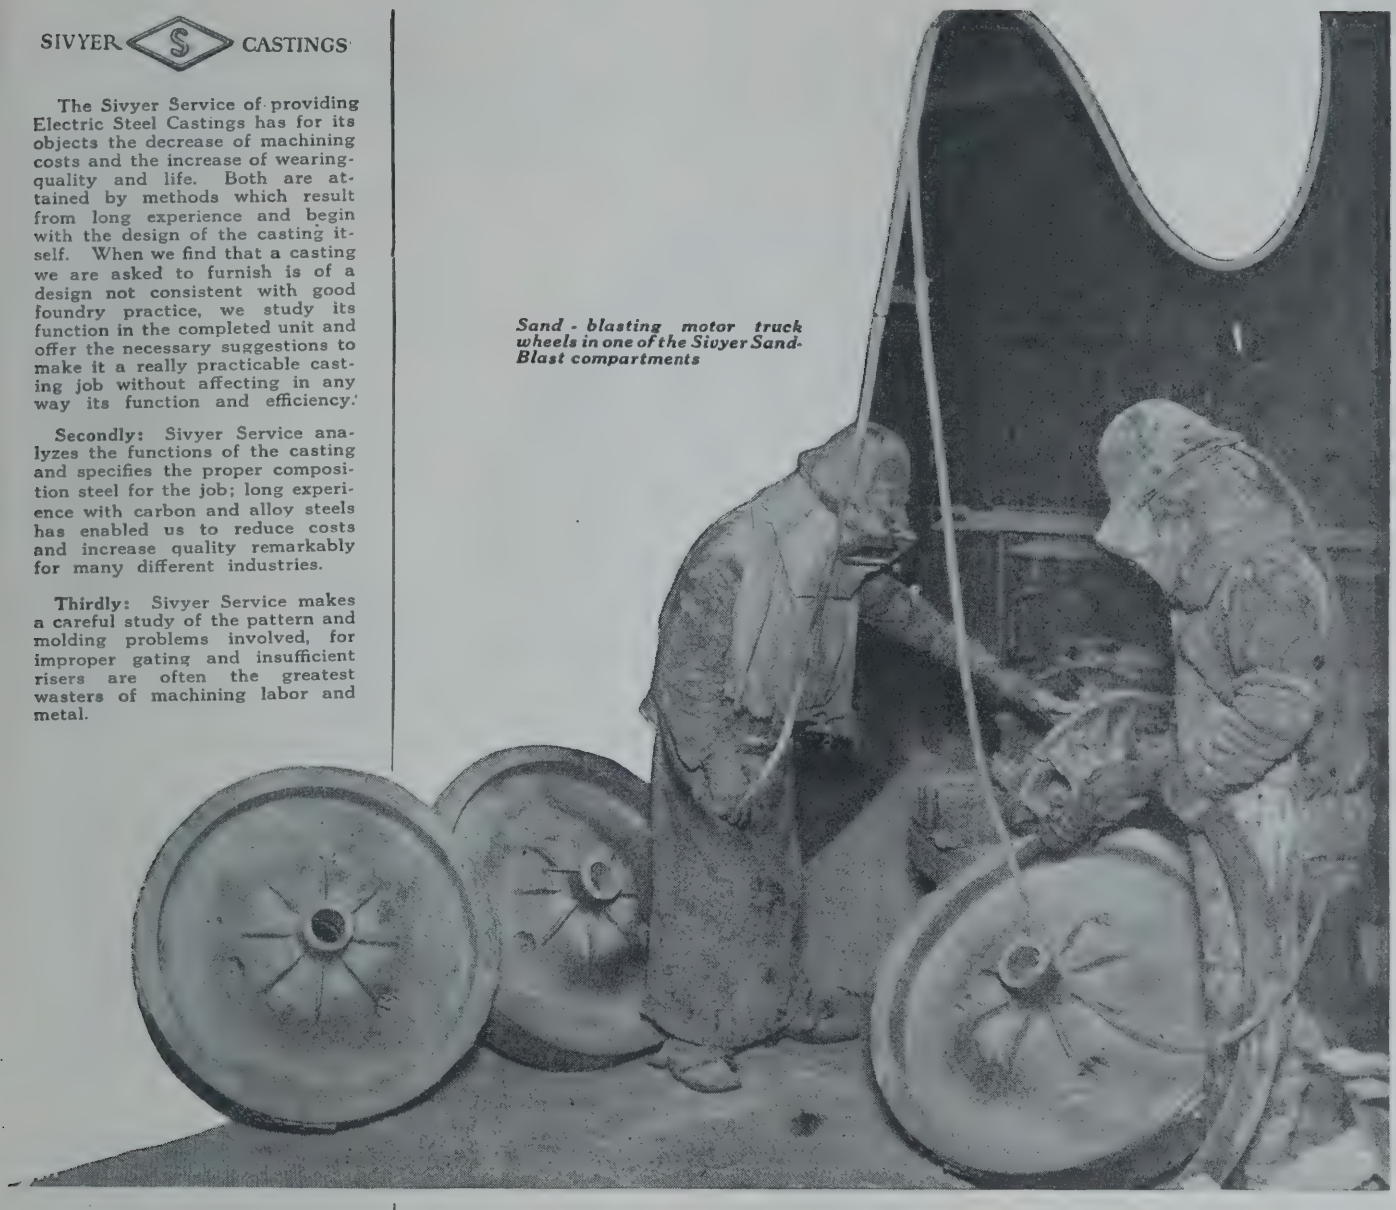
WORCESTER, MASS.—The Clarke-Emerson Mfg. Co. has been incorporated to build machines with $50,000 capital, by F. F. Phillips Jr., C. H. Billings and Harold F. Reed, Brookline, Mass.

PAWTUCKET, R. I.—The Hale Braiding Machine Co. has been incorporated to build textile machinery with $100,000 capital, by J. B. Hale, Arthur B. Edwards and W. Harold Balkcom.

PAWTUCKET, R. I.—The Potter & Johnston Machine Co. will build a 1-story, 112 x 273-foot machine shop addition.

PAWTUCKET, R. I.—The Tamarack Co. has let the contract for a 4-story, 114 x 174-foot addition, a 3-story, 48 x 114-foot office addition and a 40 x 75-foot power house addition, to cost $300,000.

PROVIDENCE, R. I.—The General Utilities Co. has been incorporated to make wrenches, machines, gas water heaters, etc., with $60,000 capital, by Fred B. Wemple, Richard J. Reeves and Herbert J. A. Skipp, East Providence, R. I.



PROVIDENCE, R. I.—The Oakes Aircraft Corp.

SIVYER CASTINGS

The Sivyer Service of providing Electric Steel Castings has for its objects the decrease of machining costs and the increase of wearing-quality and life. Both are attained by methods which result from long experience and begin with the design of the casting itself. When we find that a casting we are asked to furnish is of a design not consistent with good foundry practice, we study its function in the completed unit and offer the necessary suggestions to make it a really practicable casting job without affecting in any way its function and efficiency.

Secondly: Sivyer Service analyzes the functions of the casting and specifies the proper composition steel for the job; long experience with carbon and alloy steels has enabled us to reduce costs and increase quality remarkably for many different industries.

Thirdly: Sivyer Service makes a careful study of the pattern and molding problems involved, for improper gating and insufficient risers are often the greatest wasters of machining labor and metal.

Sand - blasting motor truck wheels in one of the Sivyer Sand-Blast compartments

Fourthly: Sivyer Service analyzes carefully the proper annealing methods to be used and controls their proper application through unfailingly efficient equipment and men. In short, the Sivyer Service supervises every step necessary to secure unusually and unfailingly good castings of electric steel. It never relies on one factor alone, relies very little even on the natural freedom of electric steel from occluded gases and on its commonly recognized merit in resisting crystallization. It also depends but little on the inherent scientific accuracy of the electric furnace process. From casting-design to sand-blasting and tumbling, the fundamental superiority of Sivyer Steel is due to its men and metal. Their value is best proved by the fact that, although the production of steel castings is generally looked upon as a local one, the Sivyer market is national.

SPECIAL sand-blasting equipment had to be designed in order to satisfy the Sivyer standards for finished castings. The Sivyer men who use the equipment are with few exceptions veterans who have for years done the careful work necessary to satisfy the Sivyer inspection. Although sand-blasting and tumbling are only minor processes, the thoroughness and care exercised in carrying them out in the Sivyer way are typical of effort necessary to create and maintain the superior quality that has won for Sivyer castings their national market.

SIVYER STEEL

SIVYER STEEL CASTING COMPANY, MILWAUKEE

has been incorporated to build airplanes and motor-propelled vehicles with $100,000 capital, by Nathan P. Oakes, Darius Goff, Edward E. Leonard, Earl L. Miller and William H. Peters.

BRIDGEPORT, CONN.—The Edisonia Heater Co. recently was incorporated with $200,000 capital, by Harry Mesard, Solomon Badesch and F. J. Breen.

BRISTOL, CONN.—The New Departure Mfg. Co. has let the contract for two, 3-story, 82 x 302-foot and two 1-story, 67 x 312-foot plants, to cost $1,500,000.

HARTFORD, CONN.—The Hartford Tube Products Co. has been incorporated with $200,000 capital by H. K. Herbison, P. S. Ripley and Arthur Perkins.

HARTFORD, CONN.—Max M. Slabkin, manufacturer of bicycles, etc., has taken title from the Savage Arms Corp. to several factory buildings.

HARTFORD, CONN.—The Hartford Rubber Co. has awarded contracts for an 8-story storage building, 100 x 300 feet and a garage, 100 x 150 feet.

MERIDEN, CONN.—Edward Miller & Co. have let a contract for two 1-story plant additions.

MERIDEN, CONN.—The New Departure Mfg. Co. has placed a contract with Aberthaw Construction Co., Boston, for the construction of four factory buildings, at a cost of about $1,500,000. The contract calls for two 3-story buildings, 82 x 302 feet, and two 1-story buildings, 67 x 312 feet.

MIDDLETOWN, CONN.—The Russell Mfg. Co. has started work on a factory and power house, to cost $50,000.

NEW BRITAIN, CONN.—Plans are being prepared for a 6-story, 80 x 160-foot plant addition for Landers, Frary & Clark.

NEW BRITAIN, CONN.—The New Britain Machine Co. will build a 50 x 360-foot wing to the former government arsenal shop on its land.

North Atlantic States

ALBANY, N. Y.—The United States High Speed Steel & Tool Corp. will erect a new plant in this city. D. H. Friedman, of this city, has been elected president.

BROOKLYN, N. Y.—The Metal Hose & Tubing Co., 253 Tillary street, has had plans drawn for a plant, 3-stories, 48 x 102 feet, to cost $75,000.

BROOKLYN, N. Y.—The C. & D. Metal Bed Co. recently was incorporated with $10,000 capital, by M. Reiche, L. Polansky and H. Rotman, 709 Lafayette avenue.

BROOKLYN, N. Y.—The Pan American Smelting Works has been incorporated with $75,000 capital, by I. W. Weingart, B. Michaels and S. Schlosberg, 745 Driggs avenue.

BROOKLYN, N. Y.—The Forbes Tubular Products Corp., metal products, has been incorporated with $30,000 capital, by S. H. Roberts, P. J. and R. S. Forbes, 562 Second street.

BUFFALO.—The Frontier Machine & Tool Co. will make improvements to its factory.

BUFFALO.—The Jewell Steel Co. is considering an addition to its foundry.

BUFFALO.—The Frentier Machine & Tool Co., 132 Lakeview avenue, has had plans drawn for a plant.

BUFFALO.—The Swit Automotive Corp. has been incorporated with $50,000 capital, by W. Hershaft, J. J. Akston and L. L. Lewis Jr.

LOCKPORT, N. Y.—The Lockport Foundries Corp. recently was incorporated with $210,000 active capital, by G. B. Stockwell, W. W. Campbell and J. W. Townsend.

NEW YORK.—The Rubber & Celluloid Products Co. is having plans drawn for a boiler house, 1-story, 20 x 52 feet.

NEW YORK.—The Accurate Brass Casting Co. has been incorporated with $50,000 capital, by A. J. Gutmuller, L. J. Schukel and M. G. Knorr, 1116 Wyckoff avenue.

NEW YORK.—The Universal Superheater Corp. has been incorporated with $100,000 capital, by P. McGregor, J. S. Milne and J. T. Crane, 2 Rector street.

NEW YORK.—The W. E. Nichols Corp., contracting and electrical works, has been incorporated with $50,000 capital, by R. S. King, O. A. Schramm and K. M. Nichols, 882 Eighth avenue.

NEW YORK.—The Mechanics' Tools Engineering Co. has been incorporated with $10,000 capital, by T. M. Hill, G. Warner and A. Janes, 21 East Eighty-ninth street.

NEW YORK.—Riggi Bros., 1216 Lexington avenue, has had plans drawn for a boiler room addition, 1-story, 25 x 60 feet.

ROCHESTER, N. Y.—The Co-Operative Foundry Co. has awarded contracts for a plant addition, to cost $20,000.

ROCHESTER, N. Y.—The Rochester Motors Co., Inc., 609 Driving Park avenue, has awarded a contract for a machine shop addition, 1-story, 100 x 390 feet.

ROCHESTER, N. Y.—The Inter-State Machine Products Co., auto parts and factory supplies, has been incorporated with $50,000 capital, by M. C. Armstrong, J. and F. C. Buckley.

SYRACUSE, N. Y.—The C. W. Meade Corp. has been organized to manufacture hardware and machine attachments with $100,000 capital.

UTICA, N. Y.—The Utica General Jobbing Foundry, Inc., has been incorporated with $25,000 capital, by F. Longo, G. Buccolo and J. Tomaino.

WALTON, N. Y.—The Archibald-Barnhart Co., agricultural implements, recently was incorporated with $20,000 capital, by S. M. Barnhart, S. H. Marvin and R. Archibald.

HARRISBURG, PA.—The Boll Bros. Mfg. Co. is erecting an addition to its plant, 50 x 100 feet.

PITTSBURGH.—The Superior Motor Parts Co. has been incorporated with $25,000 capital, by W. A. Wilson, G. M. Metz and W. T. Hughes.

READING, PA.—The Carpenter Steel Co. has a permit to erect a $120,000 plant addition, 147 x 280 feet.

JERSEY CITY, N. J.—The White Metal Mfg. Co. recently was incorporated with $500,000 capital, by Theodore Rurode, T. H. Smith and D. F. Edwards.

TRENTON, N. J.—The Runkles Machinery Co. has purchased a factory site and will erect a modern plant for the manufacture of machinery.

BALTIMORE.—The Standard File & Rasp Co. recently was incorporated with $150,000 capital, by W. J. Barrett, Edward Roseman and E. R. Lipman.

RICHMOND, VA.—The American Auto Accessories Corp. has been chartered with $25,000 capital, by H. R. Ansell and others.

Goverment Inquiries

BIDS on the following equipment are desired by the navy department, bureau of supplies and accounts:

Hoisting and rotating equipment and cranes, 4938, Norfolk, Brooklyn and Mare Island, Nov. 21.
Two drill presses, 4939, Newport, Nov. 7.
Eight bench grinders, 4944, Newport, Nov. 7.
Three internal grinders, 4952, Newport, Nov. 7.
One cutting off machine, 4953, Newport, Nov. 7.
One polishing and buffing machine, 4954, Newport, Nov. 7.
Eleven vertical boring bills, 4990, Washington, Nov. 25.
One traveling head slotter, 4991, Washington, Nov. 25.
One shaping machine, 4994, Washington, Nov. 25.
Four surface grinding machines, 5008, Washington, Nov. 28.
Four milling machines, 5009, Washington, Nov. 28.
Two shaping machines, 5010, Washington, Nov. 28.
Two overhead trolley hoists, 5011, Newport, Nov. 28.
One drilling, milling and boring machine, 5016, Washington, Nov. 28.

Schedule numbers, places of delivery and dates of opening follow the specifications of the tools.

Central States Activity

CLINTON, WIS.—The Clinton Mfg. Co., maker of creamery and dairy machinery and appliances, plans to erect a shop addition.

CYLON, WIS.—The Cylon-Forest Electric Co. has been organized with a capital stock of $25,000 to operate a steam generating plant at Cylon.

GRAND RAPIDS, WIS.—The Prentiss-Wabers Mfg. Co. has been reincorporated as the Prentiss-Wabers Stove Co., with a capital stock of $60,000.

JANESVILLE, WIS.—J. A. Drummond, 223 East Milwaukee avenue, will build a 2-story machine shop addition, 60 x 85 feet, costing $20,000 with equipment.

MILWAUKEE.—The Milwaukee Reliance Boiler Works is building a 1-story shop addition, 40 x 90 feet. John E. Sharp is president.

MILWAUKEE.—Articles of incorporation have been filed in behalf of the Autolife Tire Chain Co., $25,000 capital. The incorporators are Jacob Best, Henry J. Keller and Fred A. Hoya.

RACINE, WIS.—The Racine Auto Tire Co. has purchased the former Fish Bros. Wagon Co. factory. It will be reconstructed.

SHEBOYGAN, WIS.—The Globe Foundry Co., incorporated recently, has increased its capital stock from $100,000 to $200,000 because of the enlargement of its new plant construction program. Plans

Herringbone Gears Units

Large steel mills have accorded FALK Herringbone Gears universal recognition for their electric drives, and heavy shaft line drives.

They have found that these gears are absolutely dependable and eliminate all shock, noise and vibration. They reduce upkeep and consumption of power.

Steel Castings

From 1 Pound to 100,000 Pounds

Business Changes Recently Announced

WHEN G. T. Eames decided to remove his business to Evansville, Ind., from Kalamazoo, Mich., he changed his company's name from the Kalamazoo Arbor Press Co. to the Evansville Arbor Press Co. It manufactures quadruple compound mandrel presses as well as twist drill grinders. At Evansville a stock company was formed with $50,000 capital; Mr. Eames is president; William P. Rus, vice president, and J. J. Reinhard, secretary and treasurer. A factory, 68 x 150 feet, has been established at 112 Pine street and considerable new equipment has been installed to supplement the machinery brought from Kalamazoo. Others interested in the company are: W. H. McCurdy of the Hercules Co., J. B. Graham of the Graham Glass Co., and John O. Daves, president of the Old State National bank.

* * *

The name of the Canton Engineering & Electric Co., Canton, O., has been changed to the Moock Electric Supply Co., and capital increased from $150,000 to $500,000.

* * *

The H. R. Lewis Tool Co., Detroit, has been sold to the F. R. Fortune Tool & Mfg. Co., Wooster, O., to which town the Detroit plant will be moved when a new factory is ready.

* * *

The American Instrument Works, Pittsburgh, incorporated July 10, last, has succeeded to the business of the Pittsburgh Instrument Co. The company, which is under the management of Earnest A. Schurk, is located at 18 Lacock street, north side, Pittsburgh, and manufactures tools, jigs, dies, machine parts and scientific instruments.

* * *

The Bucyrus Co., South Milwaukee, Wis., has transferred its southern sales offices from New Orleans to Birmingham, Ala.

* * *

The Steel Sales Corp., Chicago, has opened an office at Detroit, in charge of J. P. Mumford, assisted by C. B. Peterson. The office is at 403 Book building, and a full line of steel products handled by this concern will be available.

The National Trading Co. now represents the Colonial Iron Co., Riddleburg, Pa., in the sale of low phosphorus pig iron in the Pittsburgh district.

* * *

The Egbert-Hancock Co., Chattanooga, Tenn., has succeeded the W. S. Taylor Co. and will continue to sell a complete line of iron and steel products, representing a number of large manufacturers.

* * *

The Lyon Metallic Mfg. Co., Aurora, Ill., maker of steel shelving, lockers, boxes, cabinets, etc., has opened a branch sales office to serve the New England district, at 161 Devonshire street, with J. B. Throckmorton in charge.

* * *

The Liess Iron & Metal Co., Neenah, Wis., has acquired the business of the A. Krone Iron & Metal Co. of Appleton, Wis., which were consolidated with headquarters at Neenah on Nov. 1. M. Liess is president, and H. Gazerwitz secreary and treasurer.

* * *

The American Piercing Saw Co., Providence, R. I., has changed its name to the Chadbourne Optical Co.

* * *

The Schroeder Headlight & Generating Co., Evansville, Ind., has changed its name to the Sunbeam Electric Mfg. Co.

Comfort and Safety---

This *Scfety First Working Shoe* is a durable, stylish shoe, that will afford protection to the foot and give multiple service. No matter how often it gets wet it will always dry soft and flexible, without treatment. It has a half bellows tongue which prevents foreign matter from entering.

Made in all half sizes from 5 to 11.

Note the specifications on illustration.

No. 3033 B Safety First Working Shoe

Our No. 863 B Molders Shoe—safe, economical, dressy. Sole is so soft it can be almost doubled up. Top is as soft as Vici Kid, but much more durable. Genuine Goodyear Welt Fastened.

The "SAFETY FIRST" WORKING SHOE is exceptionally comfortable. The sole is flexible and the top very soft. It is Genuine Goodyear Welt Fastened.

Safety First Shoes are *not* handled through dealers. They are sold *direct* to business concerns that are desirous of supplying their employes with high quality shoes at *"H.C.L."-busting prices.*

You'll do well to let us send you samples.

SAFETY FIRST SHOE CO.

General Office: P. O. BOX 1164

PROVIDENCE, R. I.

facture steam engines by Phillip L. McKee, H. L. Putnam and Clarence A. Andrews.

Storing Coal Economically with Link-Belt Cranes

THIS illustration shows a birdseye view of the enormous coal storage plant at the Kinnickinnic yards of The Milwaukee Electric Railway & Light Co., Milwaukee, Wis. Here three Link-Belt Locomotive Cranes are employed for continuous and dependable service. Now is the time for you to store coal, and prepare for the coming winter. Let us show you how economically a Link-Belt Crane can store and reclaim your coal. Our systems cover all sizes of storage—from the smallest to the largest. **Write for our Locomotive Crane Catalog No. 370**

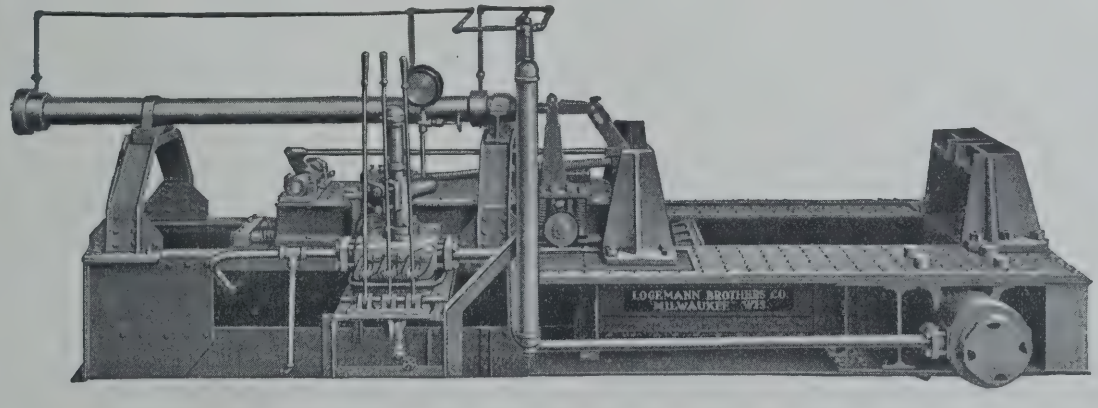
Eastern Pennsylvania	23.00 to 24.00

When the Scrap Market Is Dull

While seeking a more favorable market the best form in which to hold your sheet scrap, etc., and the form that always commands the best prices is the dense hydraulically compressed bundle.

Thus less storage space is required—under roof to prevent loss from corrosion; and because of greater car tonnage under minimum car rate, you add from 25% to 50% freight savings to your profits.



For greatest compression, largest daily output, at lowest operating cost, use

LOGEMANN Double Ram Hydraulic Scrap Metal PRESSES

You can enjoy the advantage of the accumulated experience from hundreds of Logemann scrap bundling presses now in use.

They embody a simplified mechanism that requires no special skill to operate rapidly. Press and pump are so designed that all the motive power applied is utilized, thus reducing power cost.

Powerfully built, all working parts constructed to resist the severest strains—selected material, first class workmanship—all minimize upkeep cost and insure lasting efficiency.

A medium sized press is shown; there are smaller and larger sizes in standard models.

Advise character and daily tonnage of your scrap and let us suggest press best suited to your requirements.

Logemann Brothers Co.

3126 Burleigh Street
Milwaukee, Wis.

New Trade Publications

PUNCHES.—A booklet entitled, "The Cleveland System," containing descriptions and line drawings of sheet and plate punches and dies, has been published by the Cleveland Punch & Shear Works Co., Cleveland. Specifications and other data are given.

SAND-BLAST.—A booklet entitled "A Magazine of Progress," containing frivolous and serious side lights on business topics, and also a general description of a sand-blast cabinet, has been published by the W. W. Sly Mfg. Co., Cleveland. The cabinet is illustrated.

STEEL.—A booklet entitled "The Birth of A Steel," is being distributed by the Century Steel Co. of America, Poughkeepsie, N. Y. The booklet contains a story, told in autobiographical form, of the development of steel manufactured by the Century company. An analysis of the steel is given.

BELT CONVEYORS.—Catalog No. 3, issued by the Barber-Greene Co., Aurora, Ill., describes and illustrates portable and stationary conveyors and self-feeding bucket loaders. Several types are described and fully illustrated. Some of the illustrations show the equipment in actual service.

CRANES.—The Northern Engineering Works, Detroit, has published catalog No. 28, in which electric cranes, hand power cranes, electric hoists and air hoists are fully described and illustrated. The booklet contains condensed descriptions of the various equipment all of which are fully described.

WELDING AND CUTTING.—Oxyacetylene welding and cutting apparatus is described and illustrated in a leaflet being circulated by the Alexander Millburn Co., Baltimore. Brief descriptions of the equipment are given which are accompanied by illustrations. The leaflet contains a pressure chart and other data.

POWER EQUIPMENT.—Catalog 44-A issued by the Ohio Blower Co., Cleveland, contains illustrations and descriptions of steam power plant equipment, including steam traps, separators, exhaust heads, feed water heaters, flanges, gasoline oil separators, water level control valves and various steam specialties. All equipment is fully described, including specifications, and are illustrated.

HANDLING EQUIPMENT.—Mechanical handling equipment of all kinds is described and illustrated in a booklet recently published by the Ohio Equipment Co., Cleveland. The equipment described includes, lift trucks, steel truck platforms, shop mules, overhead carrying equipment, conveyors, tiering machines, crane scales, bundle tying machinery, etc. All are fully described and illustrated.

RECTANGULAR MAGNETS.—The Cutler-Hammer Mfg. Co., Milwaukee, recently published booklet *J*, in which it describes and illustrates rectangular lifting magnets, designed for handling regular shapes in iron and steel, such as sheets, bars, billets, ingots, pipes, etc. The booklet contains a description of these magnets as to their construction, etc., and contains illustrations showing them in actual use.

HEAT-TREATMENT CHART.—An interesting contribution to trade literature is a cardboard steel heat-treatment chart which has been published by the W. S. Rockwell Co., New York. Besides the chart, a conversion table showing corresponding temperatures on the centigrade and fahrenheit scales, data on specific heats and melting points, conversion table of power equivalents, heat equivalents, etc., are given.

WELDING REPAIRS.—An illustrated booklet of 16 pages showing how the damaged German ships, which were taken over by the government, were repaired by the use of electric welding, recently was published by the Wilson Welding Repair Co., Ltd., New York. The illustrations are interesting and show workmen engaged in repairing the damaged boilers, cylinders, steam engines, etc.

LUBRICATING DEVICES.—An illustrated booklet of 20 pages has been published by the Hills-McCanna Co., Chicago, in which force feed lubricators, high pressure gage cocks, low water alarms, boiler compound feeders and boiler test pumps are described and illustrated. A brief outline of each device is given, giving specifications, etc. The illustrations give the reader a comprehensive idea of the devices.

VENTILATORS.—The Ohio Blower Co., Cleveland, has published the sixth edition of a booklet, devoted to describing and illustrating metal ventilators. The booklet is replete with illustrations of this equipment, showing a number of actual installations and the descriptions contain data showing the ventilation requirements of plants and structures of all kinds. Specifications, etc., are given. The booklet is entitled, "The Gospel of Fresh Air."

PREHEATER.—A 14-page loose leaf booklet has been issued by the Geist Mfg. Co., Atlantic City, N. J., in which a general continuous metal preheater is described and illustrated. The preheater is square in shape with a large flat table-like surface. The top consist of heavy metal grating between the bars of which is placed a special heat-absorbing element, which absorbs the heat furnished by a series of burners. These burners are placed in rows, running from the sides to the center and each is controlled by its own valve. A cooling oven is located beneath the burners. This oven retains a heat ranging downward from 500 degrees Fahr. and is designed to be free of all draught, and to reduce the heat of the finished piece with a slow even contraction. Other parts of the preheater are described.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

DISTRICT OFFICES

New York, 734 Customhouse; Boston, 1801 Customhouse; Chicago, 504 Federal bldg.; St. Louis, 402 Third Nat'l Bank; New Orleans, Hibernia Bank; Seattle, Henry bldg.; San Francisco, 307 Customhouse

CO-OPERATIVE OFFICES

Cleveland, Chamber of Commerce; Cincinnati, Chamber of Commerce; Los Angeles, Chamber of Commerce; Philadelphia, Chamber of Commerce; Portland, Oreg. Chamber of Commerce; Dayton, Ohio, Chamber of Commerce; Pittsburgh, Chamber of Commerce

A firm in Norway desires an agency for the sale of automobiles and supplies, engineering and building materials, heating furnaces, electric fixtures, elevators and hoisting machinery, brewing machinery, etc. Opportunity No. 30992.

An agency on a commission basis is desired by a man in Spain for the sale of everything in the line of builders' supplies, such as iron in round bars and special forms for reinforced concrete construction. Opportunity No. 30998.

An agency is desired by a man in Belgium for the sale of material for building construction, such as beams, girders, reinforcing steel, hardware and locks. Correspondence and catalogs should be in French. Opportunity No. 31002.

A firm in France desires to be placed in communication with manufacturers with a view to purchasing machinery for making wooden cart and barrow wheels; 1-spindle shapers with tilting table for curved surfaces, etc. Opportunity No. 31007.

A firm in Switzerland desires to purchase articles for sale in the iron trade, principally tools, planes, saws, axes, chisels, screwdrivers, etc. Correspondence should be in French. Opportunity No. 31012.

The secretary of a power-boat club in the British West Indies desires catalogs and price lists of American power-boat engines of from 10 to 35 horsepower. Opportunity No. 31013.

A manufacturer's agent in Australia desires catalogs and price lists with a view to securing an agency from manufacturers of enameled kitchen ware. Opportunity No. 31017.

A firm in Brazil desires to purchase machinery for grinding wheat. Correspondence should be in Portuguese. Opportunity No. 31020.

An agency is desired by a party in Italy for the sale of electrical materials, agricultural implements, machines, tools, etc. Correspondence should be in Italian. Opportunity No. 31023.

A merchant in Spain desires an agency on a commission basis for the sale of steel cables for fishing trawlers, etc. Correspondence should be in Spanish. Opportunity No. 31029.

A firm in Italy desires to secure an agency for the sale of telephonic, telegraphic apparatus and electrical supplies. Opportunity No. 31133.

Catalogs of tractors and farm implements are desired by rubber plantations in the Dutch East Indies. Opportunity No. 31073.

An agency on a commission basis is desired by a commercial agent in Spain for the sale of hardware, tools and similar articles. Correspondence should be in Spanish. Opportunity No. 31104.

A traveling man in Belgium desires an agency for the sale in France and Belgium and surrounding countries, of hardware, small tools, technical specialties, etc. Opportunity No. 31105.

A firm of merchants in England desires to purchase an agency for a machine for making tin or thin sheet metal elbows. Opportunity No. 31109.

A commercial agency firm in France desires to secure the representation of manufacturers for the sale of machine tools, oil motors, compressors, pumps, turbines, lathes, drilling machines, etc. Opportunity No. 31129.

An agency is desired by an American citizen established in France for the sale of farm implements and sewing machines. Opportunity No. 31130.

Representation of American firms is desired by a company in France for the sale of hardware, especially tools and articles used in the locksmith trade. Opportunity No. 31131.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, November 13, 1919 *No. 20*

Problem of Supply is Paramount

Though Strikes No Longer Are Large Factor, Loss of Production Causes Backing Up of Huge Unfilled Tonnage for Mills—New Business is Discouraged —Prices Are Buoyant and Some Advances Continue

WITH the coal strike officially terminated and the steel strike in its last stage of dissolution, the factor of labor unrest has assumed secondary importance for iron and steel manufacturers. The chief problem at this time is how to handle the large tonnage of unfilled orders on which deliveries are past due and to accommodate the insistent demands of consumers for further materials. Little progress has been made in reducing deferred obligations which have been piling up by reason of the loss of production during the past seven weeks; in fact specifications still are pouring in upon the producers in a volume that offsets the increasing output. It is certain large tonnages of undelivered 1919 orders must be carried over by the mills into 1920. One independent interest is credited with an order book of 150,000 tons in bars alone.

In view of this condition, producers are almost a unit in declining or discouraging the placing by buyers of new contracts for the first quarter. Nevertheless there is much pressure on the part of consumers largely to obtain an assured place on mill books. It is quite possible, therefore, that the bars may be let down partially on this business, especially in those lines where the recovery of production has been more rapid. The leading sheet and tin plate interest has not opened its books for 1920 contracts but is expected to do so soon. Independent makers will follow quickly. An oil interest is trying to place 100,000 boxes of tin plate for first quarter.

Price Action Awaited

Much interest centers upon the price schedules that eventually will be announced by the majority of producers on next year's business. While former levels remain in force these in the absence of a disposition to sell, largely are nominal. Here and there where producers are offering material, advances are being readily obtained. An eastern plate mill has withdrawn its price of 2.65c and is naming 2.75c, mill or Pittsburgh, on next year's business. Pittsburgh makers here adopted a second advance of $2 per ton in bar iron. Small rivets, nuts and bolts again have been raised. Some sizes of chain have been advanced. Independent sheet producers show a disposition to ask higher prices for first quarter.

Rail Market is Active

The rail market continues to show much activity as the roads are looking forward to restored private control. At Chicago, western lines virtually are closing orders for 1920 delivery totaling 150,000 to 200,000 tons. The New York Central system is about to come out for a large tonnage in the East where the Erie railroad is figuring on 20,000 to 30,000 tons and the Pennsylvania lines east continue to negotiate for 200,000 tons. Belgium has placed 20,000 tons of open-hearth rails with the Steel corporation for first quarter at a reported $5 advance. Car repairs for domestic roads placed at Chicago call for about 35,000 tons of steel. The American Car & Foundry Co. has bought 15,000 tons of plates in the East. The Union Tank Car Co. has ordered 4000 tank cars.

Scrap prices now are advancing all along the line. Some grades are scarce, particularly borings and turnings of which eastern consumers with a demand of 90,000 tons monthly have been able to obtain only about 30,000 tons. A Chicago dealer has purchased 171,000 tons of shell steel from this country and Canada.

Iron Prices Still Rise

Pig iron prices are keeping up their steady advance as the demand exceeds the supply. A level of $32 for 1.75 to 2.25 silicon foundry iron now is well established in the valleys, at Cleveland, Buffalo and other nothern points. In the East and in Virginia 2.25 to 2.75 silicon iron ranges from $33.25 to $35, furnace. Alabama makers are up to $30 for the base grade. Basic iron which has been lagging behind other grades has been sold in fair tonnages at from $27.25 to $27.70, valley, and these transactions definitely fix the hitherto unsettled market. Smaller sales have been made at $29, furnace. In the East basic has taken an upward spurt of $6 a ton and about 35,000 tons have been sold at $33, furnace. Bessemer has been sold up to $29.50, valley.

Report Shows Steel Strike Folly

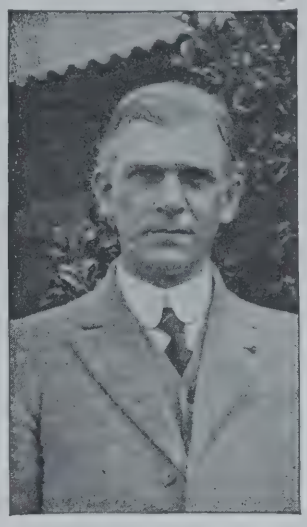
THE report of the senate committee which investigated the steel strike must be recognized as a sincere effort on the part of intelligent men holding a position of trust, and having due regard for the interests of the public, employers and employes, to fairly analyze the situation and to make suggestions of a constructive character.

The committee finds that the real cause of the strike was the effort of the American Federation of Labor to organize the workers in the industry; it finds that the "business manager" of the strike, William Z. Foster, is a man whose views and influence are highly detrimental to the best interests of the workers and to the country in general. It criticizes President Gompers, Fitzpatrick and Tighe for sanctioning the strike in opposition to the desire of President Wilson. It declares that wages paid to the workers are satisfactory. It finds that the extreme radicals within the American federation were aided by the worst elements in America.

The committee states that Judge Gary could hardly be blamed for refusing to receive such a man as Foster. It says that Judge Gary might have received a delegation representing the union workers. But it makes it clear that Judge Gary was not at fault in view of the fact that Foster was the active head of that committee.

The committee's recommendation in regard to the 8-hour day is a matter for serious consideration by the employers. It is the only point in the entire list of 12 strike claims on which the committee could find cause for grievance. It is probable due weight was not attached to the difficulties encountered in the operation of three shifts and to the fact that thousands of workers desire to work more than eight hours because of the extra pay they receive. However, the question of an 8-hour day involves the desires of the workmen themselves, removed from the influence of those disturbers who are seeking to act for them. In a number of instances, large groups of men in the steel industry have voted for a 10-hour day. What is the will of the majority when all circumstances are understood?

The report should quickly wipe out the last traces of the strike. The strikers have lost, and now they know why they have lost. In some other way, and from time to time working conditions in the iron and steel industry will be improved, as they will be improved in all other lines of activity, but they will not be improved by the workers placing their trust in the Fosters and the Fitzpatricks. If the report of the senate committee convinces them of that fact it will have accomplished great good.



Pig Iron Output Recuperates

THAT the back of the steel strike is broken is shown conclusively by blast furnace statistics for October. Of 103 stacks forced to bank or blown out in September because of labor trouble, 54 were able to resume operations in October. Ninety-one of the 103 stacks were steelworks units, while the remaining 12 were merchant furnaces. October's figures show a net gain of 41 steelworks stacks, and a net gain of 13 merchant stacks, with the result that the number of merchant furnaces in blast Oct. 31 was one more than on Aug. 31, the most productive month since last March. Merchant iron production in September, 567,608 tons, represented a gain of 19,183 tons over August with 548,425 tons, and although the October tonnage, 564,697, showed a loss of 2911 tons in comparison with September, the total still was a gain of 16,272 tons over that of August.

Production was not severely affected during September since the strike occurred late in the month. Consequently the real cutting off of output was not registered until October. However, the number of stacks relighted showed a decided improvement late in October.

It remains for November to show the extent of the recuperation in October. It undoubtedly will reflect a further satisfactory recovery.

The Iron Trade Review, an International Authority

F. M. MANSFIELD

FOUR years of war have internationalized the vision and plans of American business as no other period in history. From choice or destiny, the international perspective today dominates the thoughts and aspirations of its leadership. With these greater opportunities for enterprise and initiative have come new responsibilities. In no field is this obligation more direct and certain than with the business press. Today continuing and accurate business information of overseas markets takes rank with ships or exchange, goods or credit, in the success of international enterprise.

Keeping step with the new conditions and mindful of its duty toward the great industry which it represents, THE IRON TRADE REVIEW has completed its plans more definitely to internationalize its scope and influence. Although for years possessed of a superior foreign news representation through resident correspondents, the new program calls for a notable expansion of these facilities and their operation under American management. A special European division of THE IRON TRADE REVIEW and its affiliated publications of The Penton Publishing Co., has been created. Commodious and specially equipped offices have been established at Dorland House, 16 Regent street S. W. I., London, which will be the centering point for all European business and editorial activities. From there the work of correspondents in England, France, Belgium, Germany and other industrial countries of Europe will be directed. In this way a system of close editorial supervision in accordance with American standards and interests will be provided. THE IRON TRADE REVIEW thereby will be afforded a European representation superior to any publication in its line and unexcelled by that of any other trade paper in this country. It will be able to present international market reports on iron and steel and nonferrous metals, technical developments, industrial news and other editorial matter of a business character with the same completeness and authority which has marked its treatment of these subjects in this country.

H. COLE ESTEP

H. Cole Estep, who has been made manager of the European division, has been prominently identified with the staff of THE IRON TRADE REVIEW since 1908. His experience has included many years of study and of close contact with both the commercial and technical branches of the American iron and steel and metalmaking industries. A graduate engineer, he has filled for many years the post of engineering editor of THE IRON TRADE REVIEW and is especially fitted to present and interpret the development of European production and manufacturing practice in the reconstruction period. Mr. Estep, , who has been editorial director of The Penton Publishing Co., will devote his sole attention to foreign development. He is now in England arranging for the opening of the new division headquarters.

JOSEPH HORTON

Joseph Horton, of Birmingham, England, remains as British correspondent, a post so capably filled for many years. Mr. Horton's iron and steel market reports and articles long have been accepted as authoritative.

Francis Miltoun Mansfield, whose numerous articles on French, Belgian, Italian and German industrial conditions appearing in THE IRON TRADE REVIEW for several years past under the authorship of Francis Miltoun, have attracted wide and favorable attention, will continue as French representative. Mr. Mansfield is an American thoroughly familiar with European industrial conditions.

Various additions to the European editorial staff are to be made from resident correspondents in Great Britain and on the Continent, so that the activities of every great industrial country and section each week will be brought completely and comprehensively before the readers of THE IRON TRADE REVIEW.

Iron and Steel Prices

Corrected to Wednesday Noon

SCRAP, WAREHOUSE, ORE AND OTHER PRICES ON PAGES 1358 AND 1360

Pig Iron

Bessemer, valley	$28.50 to 29.50
Bessemer, Pittsburgh	29.90 to 30.90
Basic, valley	27.25 to 27.70
Basic, Pittsburgh	28.65 to 29.10
Basic, delivered, eastern Pa.	34.00
Malleable, Pittsburgh	32.40 to 33.40
Malleable, Chicago, furnace	30.50
Malleable, Buffalo, furnace	32.00 to 33.00
Malleable, delivered eastern Pa.	nominal

Basic Iron Takes Upward Swing

Eastern Buyers Close for 30,000 to 35,000 Tons at $6 Advance—Valley Basic Sells at $27.25 to $27.70—Iron Market Continues General Advance—Northern No. 2 at $32 and Southern Iron at $30

Philadelphia, Nov. 11.—Basic iron in the East underwent a sensational advance of $6 per ton the past week. One user bought 21,000 tons for first quarter at $30, furnace, another 6000 tons for first quarter at $33, furnace, and another 6000 tons for first half at $33, furnace. The latter price now is the market. One maker on the basic business asked $35, furnace. Several thousand tons of standard low phosphorus was sold at $39, furnace, for this year's delivery and 2000 to 3000 tons of copper-bearing iron for this year and first half went at $35, furnace. It is expected, however, the low phosphorus market shortly will be higher. A number of sales of foundry iron for this year were made at $35 and $35.25, eastern Pennsylvania furnace, for No. 2X (2.25 to 2.75 silicon) and $34 for No. 2 plain (1.75 to 2.25 silicon). Some business for first quarter was booked at $35. Central Pennsylvania makers after selling No. 2X for this year at $35, furnace, now are asking $35.50. One Buffalo maker is making $36, Buffalo, for No. 2X for this year. Virginia No. 2 plain (1.75 to 2.25 silicon) now is $32, furnace, and more than 1000 tons were sold at this price. No. 2X (2.25 to 2.75 silicon) was sold at $33.25 and No. 1X (2.75 to 3.25 silicon) at $35. The wildness of the market is reflected by soles of Virginia No. 2 plain to this district for this year at $35, furnace. The Juniata furnace will go in on foundry in December, and the Temple furnace may make foundry soon. Gray iron is nominal. Some malleable, now is obtainable in East at around $36, Philadelphia but none has been sold as yet as far as can be learned.

The J. L. Matt Co.'s inquiry for 2500 tons of foundry iron still is pending.

Boston Buying in Southern Markets

Boston, Nov. 10.—With almost all available supplies of spot northern pig iron taken during the feverish buying of the past two weeks, foundries in New England are turning to the Alabama and Virginia fields. Furnaces which normally supply New England have no more than a few hundred tons of No. 2X (2.25 to 2.75 silicon) for prompt shipment and this situation is sending up prices. Resale iron is coming into the market in large quantities and sales at $28, delivered, have been reported for iron with 2.25 to 2.75 per cent silicon. The 1920 market is also strong, and the few furnaces that have iron for this delivery are quoting higher prices. One eastern Pennsylvania furnace is asking $33.75 for No. 2X (2.25 to 2.75 silicon) and reports that this price will be advanced during the week. A Bridgeport, Conn., consumer bought 300 tons of Alabama iron (silicon 4.25 to 4.75) for first half at $36, furnace, making the delivered price $42.60. The same consumer bought a like amount of a grade with less silicon from an eastern Pennsylvania furnace. Another analysis for first quarter and other orders aggregating approximately 1000 tons for this same grade have been placed. The Sloss-Sheffield Steel & Iron Co., is quoting $30 for 1.75 to 2.25 silicon iron for first quarter delivery and $31.20 for 2.25 to 2.75 silicon. The Virginia Iron Coal & Coke Co., is quoting $33 for 1.75 to 2.25 silicon, $34.25 for 2.25 to 2.75 and $36 for the 2.75 to 3.25. The Sullivan Machine Co., Claremont, N. H., has placed an order for 300 tons of high silicon iron at the regular price. The General Fire Extinguisher Co., Auburn, R. I., is in the market for its 1920 requirements. A New Britain, Conn., melter is asking for 1000 tons for first half. The Donner Steel Co., Buffalo, has been offering some prompt iron, although it is now reported out of the market. The estimated total of sales in Boston for the week is 6000 tons.

Prices Again Go Up

New York, Nov. 10.—Due to the scarcity of pig iron, holders are able to obtain constantly advancing prices on such tonnage as is available for sale. During the past week, several thousand tons of foundry iron have changed hands in this district for shipment this year. Eastern Pennsylvania iron for shipment over November and December has brought $35 furnace, for 2.25 to 2.75 silicon, and $34, for 1.75 to 2.25 silicon. Buffalo foundry for this year has sold at $33 and $34 Buffalo, for 2.25 to 2.75 silicon, and $36 has been asked on this grade. Central Pennsylvania foundry for this year has been sold at $35 furnace for 2.25 to 2.75 silicon. Iron for next year is hard to get, and sales for next year as a rule are being restricted to the needs of regular customers. Some eastern Pennsylvania foundry has been sold during the past week for first half at $34 furnace for 2.25 to 2.75 silicon and at $33, for 1.75 to 2.25. The sellers at these figures now are disposed to hold for $1 higher. One eastern Pennsylvania interest is asking $35.25 for 2.25 to 2.75 silicon for first half. While there is considerable export inquiry for foundry iron it is held up in most cases by the inability to get

the tonnage. For Birmingham iron for export, $30 Birmingham has been asked during the past week on 1.75 to 2.25 silicon. There continues an urgent demand for malleable iron from some consumers in this district, but this grade cannot be obtained in the east. There are no more offerings of charcoal iron for any delivery. On basic, it seems that the minimum asking price of the eastern Pennsylvania interests now is $31 furnace, but none has been sold at this figure. The Cranberry furnace at Cranberry, Tenn., is scheduled to go in blast on low phosphorus iron about Dec. 1.

Basic Swinging Into Line

Pittsburgh, Nov. 11.—Basic iron prices, for some time out of line with those of other grades, have moved up in the past week to more nearly normal levels in comparison with bessemer and foundry iron. Sales of fair tonnages of basic are noted from valley furnaces at $27.25, $27.60 and $27.70, while a Pittsburgh merchant interest sold this grade at slightly better than $28, furnace. All of this business is for shipment by Jan. 1. Even higher prices have been paid on smaller tonnages, sales of standard basic being reported by merchant interests at $29 valley. While the market appears to be quotable from $27.25 to $27.70, valley furnaces, based on sales of 1000 tons or more, it is doubtful if any of the makers with tonnages available for shipment over the remanider of the year, would consider less than $28, furnace. Some are asking as high as $29. Makers generally are disinclined to quote against inquiries for first quarter and first half of 1920 for basic until they have a clearer line on probable producing costs. Sales of bessemer iron have been made at $28.50, $28.95 and $29.50, valley furnace, the latter price being paid for 2000 tons by a brokerage interest. Activity in the steelmaking grades of iron are due as much to purchases by foundries as by steel manufacturers. Both basic and bessemer iron can be blended so as to replace straight foundry grades. The big recent advance in foundry iron therefore permits foundries to pay relatively high prices for these grades and to bring the iron up in silicon by the use of ferrosilicon or silvery iron. A tremendous demand has continued in both foundry and malleable grades and prices have been registering almost daily advances, especially on the sales made through brokers for shipment to markets not ordinarily served from this part of the country. Seemingly there is an acute shortage of iron along the lake front and in the Chicago district and these demands are pouring in here. Sales of 2.75 to 3.25 silicon iron for shipment in the Middle West are reported at $35 and a Pittsburgh furnace interest refused $35 for No. 2 (1.75 to 2.25 silicon) for shipment to a distant consuming point. On iron running 2.25 to 2.75 silicon, $34 furnace has been done for prompt shipment and on No. 2 (1.75 to 2.25 silicon) for first quarter, $32, furnace, has been paid by a Pittsburgh district consumer. The market now is well established at $32, furnace, for No. 2 foundry, $31 for No. 3 foundry and $30.50 to $31 for gray forge. A sale of 3000 tons of forge at $31 western Pennsylvania furnace was closed. Sales of malleable iron have been made anywhere from $29 to $31, furnace, but it is doubtful if any of this grade today could be bought as low as $30. Demands for silvery iron still are heavy and one Ohio producer who recently quoted a basis of $43.25, furnace, has announced an increase to $45.25, the same base quoted by other makers.

New Schedule to Become General

Buffalo, Nov. 11.—There is every reason to believe that the schedule of higher prices in foundry iron announced three weeks ago by a local iron interest will become the ruling schedule of the district. This schedule is $34 for No. 2 plain (1.75 to 2.25 silicon); $35.25 for No. 2X (2.25 to 2.75 silicon), and $37 for No. 1X (2.75 to 3.25 silicon). In addition to selling considerable tonnage during the past week on this basis, another interest which has been out of the market for the past two months announces that it will re-enter within a week or 10 days for 1920 iron which it will sell at these prices. The furnace which was the first to announce the prices states it will not accept any inquiry for 1920 at a less figure. Records of sales of No. 2X foundry at $35 by another district have been obtained. One furnace interest reports an inquiry for 7500 tons of all grades of foundry for delivery in 1920. This includes No. 2 and No. 2X, No. 1 and No. 1X. One interest reports sales of malleable in the week at $33.

Cleveland Prices Again Up

Cleveland, Nov. 11.—Active demand and a curtailed supply still are upholding the advancing movement in pig iron prices. Cleveland makers after selling a considerable tonnage of 1.75 to 2.25 silicon iron for this year and first half at $30 have raised their schedule to $32 for this grade and to $33.25 for 2.25 to 2.75 silicon. Some tonnage has been sold on the higher basis. A lot of Cleveland malleable also went at $32 furnace. Makers generally, however, are reluctant to sell much tonnage at any price. Spot iron is almost unobtainable and is bringing high figures. A sale of Buffalo foundry at $34 furnace or $36.10 delivered Cleveland, was closed as was some western Pennsylvania iron at 3.00 to 3.75 silicon content at $36 furnace or $38.30 Cleveland. For January-February delivery 1000 tons of 1.75 to 2.25 foundry was sold at $31 and $32 Ohio furnace. A lot of 300 tons of prompt basic was placed at $29 Ohio furnace. Owing to the attractive price for foundry iron, some of the furnaces which were contemplating going in on basic, now are planning to produce the former grade. New inquiry is active. In the latter is included a considerable tonnage for the motor car companies in the Detroit district, principal among which is 15,000 to 20,000 tons of foundry and malleable for the General Motors Corp. This latter inquiry still is pending.

Sellers Out of Market

Chicago, Nov. 11.—With most producers of pig iron out of the market for first half delivery, it is practically impossible for melters to place contracts for that position. Chicago producers are entirely out of the market for both prompt and future iron, and will not accept further business until it has been possible to determine more nearly what the future offers. Two important southern producers are out of the market. The Algoma Steel Co., which has been shipping considerable iron into this territory, is sold up as far as it desires to go. Prompt iron from outside producing centers is available in small lots, and consumers are taking it eagerly as fast as offered. In spite of the inability of melters to place their requirements pressure on makers is much less than had been expected and whatever excitement may have existed a fortnight ago, seems to have disappeared in large measure. Considerable malleable from the valleys has been sold for delivery in Chicago at $31 to $31.50, furnace. A machine manufacturer in northern Illinois is inquiring for 500 tons of foundry for first half. Several inquiries for malleable ranging from 2000 to 2500 tons for the first half are pending and are awaiting an opportunity to obtain iron produced in this district. A furnace just going into blast is expected to care for this business. An inquiry just made public calls for 600 tons of standard bessemer, 600 tons of low phosphorus and 200 tons of bessemer ferrosilicon for 1920 delivery. No producer of silvery iron now appears to be in the market. While some have sold their output for first half of 1920, the Red River furnace and stacks in Jackson county have not yet opened their books for that delivery.

Prices Still on Rise

Cincinnati, Nov. 10.—Malleable is again in demand, showing that all wants were not filled during the buying movement that was in effect the first part of October. A limited tonnage of valley malleable has been sold recently, most of which brought $34, furnace. The southern Ohio supply seems to have been exhausted. Practically every southern producer has withdrawn from the market on foundry iron, although a considerable tonnage was booked within the past few days at $30, Birmingham, for 1.75 to 2.25 silicon, with an advance of 4 per cent for the next grade. Only one interest in the Ironton district is quoting for first quarter shipment, and its price has now been advanced to $32.75. Ironton, for that delivery. No iron is now being offered for first half. Spot foundry iron is very scarce and only odd lots of resale iron are to be had in the South and holders do not seem to have any trouble in getting a premium over the market price.

Heavy Demand at St. Louis

St. Louis, Nov. 8.—The coal strike has brought out a heavy demand for pig iron and large sales have been made during the past week. Virtually everything offered has been taken, even at an advance in price. Southern producers are withdrawing certain grades because their stocks have been exhausted, while others say it is only a matter of days before they will be entirely out of the market. Foundries have enough business to keep them running full time for the re-

mainder of the year. Demand for spot iron is especially urgent. Some deliveries from Ohio and a few from Gary were reported during the week, but they are inadequate. Selling agents of the Birmingham interests report a land-office business, orders pouring in on them from the St. Louis district and from the Northwest. As high as $35 has been asked and received for No. 2 southern (1.75 to 2.25 silicon), and as a rule brokers are quoting $30 to $32.50. Furnaces are advancing their prices, and very little iron was sold under $30 during the past week. The quotation for the first quarter of 1920, when furnaces are willing to negotiate, is generally $30.

Cautious in Selling

Birmingham, Ala., Nov. 1.—Southern furnace companies generally still are refraining from selling although inquiries are numerous. It is almost impossible to obtain spot iron from southern furnaces, except in small tonnage, while three or four companies are holding off from future business in anticipation of a strong demand and better prices. While three furnaces have been banked because of the coal strike, production for the month will not be retarded much. The coal strike already is on the wane and fuel and coke soon will be plentiful.

Ore Shipments

To Youngstown District Improve—Some Contracts Will Not Be Filled

Cleveland, Nov. 11.—Shipments of ore from Lake Erie docks to furnaces continue at a slow rate, the only exception to this being a slight improvement since last week in shipments to Youngstown, due to the subsidence of the strike in that district and an increase in plant operations. While the amount of ore brought down this season is ample for the bulk of requirements instances are coming to light where certain operators will not be able to bring down sufficient ore to fill contract requirements. The frozen condition of the ore at the mines and upper lake docks, the congested condition of the docks at the lower end of the route and inability of furnaces to unload ore have contributed to slow up deliveries. An inquiry is out for 30,000 tons of high phosphorus ore, while one furnace interest has resold 25,000 tons of that grade and is negotiating for the resale of 30,000 more. High phosphorus ores are expected to be in good demand owing to the extensive operations of foundry interests. Some furnaces which originally planned to make basic and now are going on foundry iron because of the attractive prices for the latter grade have made some purchases of foundry ore on dock.

The amount of ore on dock at Lake Erie ports on Nov. 1 was 10,004,767 tons, as compared with 9,909,279 tons Nov. 1, 1918. Complete reports on shipments from the Lake Superior district show that the October movement amounted to 6,201,883 tons, a decrease of 2,339,710 compared with the month last year, while shipments for the season up to Nov. 1 amounted to 43,978,414, a decrease of 12,892,457, compared with last year.

Spot Furnace Coke Scarce

Price Advances 50 Cents as Re-establishment of Maximum Coal Prices Fails to Increase Production—Contracting for Next Year Tapering off

Pittsburgh, Nov. 11.—Spot furnace coke is 50 cents a ton higher than a week ago and extremely firm at the advance. Contrary to expectations the re-establishment of maximum coal prices, while placing no limitations on coke prices, has not resulted in a greatly increased production of coke. With the price of mine-run coal fixed at $2.35, mines, and furnace coke bringing more than $5, the latter would have been the more profitable method of marketing coal controlled by the beehive oven operators. Actually, however, the tendency in the Connellsville regions has been to keep up the production of coal, and while some operators were disposed to start idle ovens when coal prices were marked down, this has happened only in a few isolated cases. Reports from the regions today were to the effect that coal output would be kept up even at the expense of coke production until the strike of the miners in union fields is over. With contracts fully absorbing production, some of the steel companies seeking good tonnages are willing to pay $6, ovens, and an export order for a cargo went at that price. Spot standard furnace coke is quotable from $5.75 to $6, ovens, the lower price applying chiefly to small lots going to regular customers while $6 is the more general figure. Contracting for first half has tapered off. On such tonnage closed the contracts have called for a fixed price, either of $5.50 or $5.60, ovens. Operators still are disinclined to consider sliding scale contracts based, as for the last half, on basic iron at valley furnaces. Such contracts carried a price of $4.12, ovens, with basic iron at $25.75, valley furnace, and there have been few periods in the six months when the producers would not have been better paid if they had sold their coke on the market. Whether the belated advance in basic pig iron will cause any change in this attitude remains to be seen. Steady demands are coming out for foundry coke, and while the spot market is around $7, ovens, business recently has been done on either side of that figure. Production of coke in the Connellsville regions for the week ended Nov. 1, is estimated by *The Connellsville Courier* to have been 202,500 tons, as compared with 203,130 tons in the previous week.

Spot Advances at Boston

Boston, Nov. 10.—Coke shipments continue active, and spot coke has advanced to $11.40. Foundries are continuing to place orders both for this year and for first half. The foundries, however, are exceptionally well supplied for the balance of this year. As a result of the coal strike, however, a new demand for spot shipments outside of New England has sprung up, and many orders particularly from northern New York are being booked by the Everett, Mass., by-product producer. First half business is continuing on a normal basis. Flat-rate contracts are decidedly more popular than sliding scale, and the local reports that the bulk of the business is of the former character. The Providence, R. I., producer is sold up for first half.

Much By-Product Sold

New York, Nov. 10.—Continued uncertainty as to the fuel situation, because of the coal strike, has led to a continuation of the heavy volume of local coke business. The northern New Jersey by-product producer has sold good-sized tonnages both for this year and next. Its price for November-December is $7, Connellsville, equivalent to $10.10 delivered at Newark and other northern New Jersey consuming points, and at $11.40 delivered in New England. This interest is selling much foundry fuel to this district for first half at $7, Connellsville, and at $7.50 Connellsville, for shipment to the New England district.

Southern Districts Not Affected

Cincinnati, Nov. 10.—The demand for both furnace and foundry coke is more active. Connellsville producers are holding the former around $5 to $5.75 and the latter at $6.50 to $7. New River foundry coke has been advanced to $10.50 to $11, and some prompt foundry coke was recently sold at the last-named figure. Wise county oven operators are holding back accepting any more future business and nominal quotations there range for foundry coke from $8 to $8.50, ovens.

Coke Scarce at St. Louis

St. Louis, Nov. 8.—Dealers and producers report an enormous inquiry for coke for prompt shipment, and extreme difficulty in securing material. Conditions are like those obtaining during the rush period of the war. Freight equipment is scarce, and should the coal strike continue, it is feared freight trains will be retired by western railroads. Certain foundries in this district have been required to draw on scanty reserves of fuel, but the leading by-product interest still has a fair supply. There are numerous inquiries from the West, Southwest and Northwest. Thus far there has been no interruption in oven operations. Prices are strong and are advancing. Connellsville 72-hour foundry is quoted at $7, ovens, against $6.75 to $7 last week, and premiums over the quoted figure are being paid for prompt delivery.

Production in South is Fair

Birmingham, Ala., Nov. 11.—Despite the coal strike, coke production in the South has been fair since Nov. 1. Iron and steel companies, with one exception, have managed to obtain sufficient coke for their own needs. Independent coke producers were not so fortunate, but at the beginning of the second week of the coal strike the output of coke is improving. Contracts to run for several months are offered independents.

Scrap Prices Are Rising

Eastern Buyers Bid Up Market There and at Pittsburgh—Great Tonnages of Borings and Turnings Sought—Buying Increases

FOR COMPLETE SCRAP PRICES SEE PAGE 1360

Philadelphia, Nov. 11.—Scrap demand is active and sales are limited only by willingness of dealers to sell. The Alan Wood Iron & Steel Co., this city, inquired for 15,000 tons of heavy melting steel but could buy only 6000 tons. This purchase was made at $20.50, delivered. Car wheels are active, selling for $28, delivered. Iron axles are strong, bringing $40. Nearly 1000 tons of steel axles were sold for export at $32, New York. From 3000 to 4000 tons of rerolling rails were sold at $28 and another big tonnage is wanted. Cast scrap prices are going up in sympathy with pig iron scrap. The estimated demand for borings and turnings now is 90,000 tons monthly, of which only one-third is obtainable. The big demand is due to fact that many blast furnaces became accustomed to using borings and turnings during the war when this scrap was produced in large quantities. One eastern furnace bought 1000 tons of machine shop turnings during the past week at $16.50.

Boston Market is Active

Boston, Nov. 10.—Pennsylvania steel plants are placing orders in the local scrap market and trading has become unusually active. The Alan Wood Iron & Steel Co. has been one of the active buyers and has been offering $20.50 for heavy melting scrap delivered. The scarcity of pig iron has made nearly every foundry in New England a prospective purchaser of cast scrap. Stocks of this grade are rapidly being depleted, and substantial advances are expected by the dealers. Borings are practically unobtainable and the small lots that come out have sold at high prices. In some cases $21, delivered, has been paid for chemical borings, and $18.50 is a common price for those not for chemical use. Malleable iron scrap is in particularly good demand for use in place of malleable pig iron by consumers who seldom use scrap in any form. A lot of 445 tons of malleable trench mortar castings was awarded to Perry, Buxton & Doane at $18.30 f.o.b. South Boston.

New York Conditions Strong

New York, Nov. 10.—Strength continues to characterize the local scrap market. Quotations, although advanced in but few instances, are tending upward, and trading involves considerable tonnage. Wrought appears to be the only grade not in active demand; nevertheless, prices are being stimulated by the strength in other materials. Another description not moving so freely is cast scrap. This, however, is due to scarcity of supplies rather than to a lack of demand.

A feature of the local market has been the irregularity in the prices of clean cast borings and mixed borings and turnings. The differential has been much wider than usual, as indicated by the present market of $11 to $11.75 on mixed borings and turnings and $15 to $16 on clean cast borings. This irregularity is attributed to a heavy demand for clean cast borings by the chemical interests, which has forced the steel manufacturers to advance their offers. Heavy melting steel, probably is reflecting the greatest strength. Good tonnages are moving at $16.50 to $17, f.o.b., New York.

Buffalo Prices Strengthened

Buffalo, Nov. 10.—Scrap dealers believe there is good business in store for them in the near future. There is a good outside demand with some fair sales and there is fair buying by mills within the district. Some consumers are interested in large tonnages and just as soon as labor troubles are settled, dealers believe they will come into the market stronger than at any time since the armistice. There have been some sales of steel to local mills. Cast, car wheels, machine shop scrap and cast borings are strong, and prices in some instances have strengthened.

Prices Move Up Sharply

Pittsburgh, Nov. 11.—Sharply higher prices on all grades of scrap have been established since a week ago. Open-hearth grades have shared in the advance, not so much because of a good demand from Pittsburgh district steel manufacturers, although they have been doing some buying, as because of the fact that eastern manufacturers, practically unaffected by the strike and in receipt of big orders, have been paying better prices than could be obtained for material here. An advance here to the equivalent of those prices prevailing in the East has been the consequence. Harrisburg and Phoenixville, Pa., consumers recently paid $20, delivered, for cast borings and $17, delivered, for machine shop turnings, in the West. Consumers in this district have raised their bids accordingly. As much as $18 has been refused for borings by dealers. Pittsburgh district steel companies have paid up to $14 for machine shop turnings. While generally steel manufacturers will not pay $21 for heavy melting steel, fair tonnages have been moved at $21.50, and that is at least $1.50 below the price at which most dealers would be willing to take an order. Consumers here still are inclined to pass up baled and bundled sheets, but they are being taken by eastern plants and this has resulted in higher local prices. Larger demands are coming out for low phosphorus steel and this grade is scarce. A Chicago interest recently bought the shell steel stored at Neville island at $24.50. While this steel in part is "unguaranteed" low phosphorus, this business forms a basis for the value of "guaranteed" low phosphorus. A bid of $22.60 for knuckles, couplers and springs by a Pittsburgh dealer failed to secure any of the material from the Pennsylvania railroad, lines east. Foundries continue persistent buyers of No. 1 cast scrap. Rerolling rail mills are seeking old standard sections and dealers here have made sales into Ohio as high as $32, delivered, which would mean about $29.50 to $30, here. Bar iron manufacturers have recently paid $40 and $41 for iron axles and car builders up to $29 for cast iron car wheels.

Market Tone is Firmer

Cleveland, Nov. 11.—Scrap iron and steel is decidedly firmer in tone, and an increase in shipments, while slight, is noted. Prospects are not strongly encouraging, but they appear the best now of any time since the steel strike began. Every week sees operations of melters on the increase. Some heavy melting steel has been sold to a nearby consumer, with a 50-cent freight rate from Cleveland, at $20.50 delivered. One scrap firm claims to be willing to take on 5000 tons of melting steel at this figure. Offers of about $1 higher than the prevailing quotations are made for axle turnings and machine shop turnings, but no trading has yet come about. Cast iron borings, No. 1 and 2 busheling, small forge flashings and short steel rails for melting have been advanced slightly.

Chicago Market Strong

Chicago, Nov. 11.—Continued demand for practically all grades of iron and steel scrap characterizes the market in Chicago, and prices are advancing steadily in keeping with the comparatively small supply of most grades. Steel mills are increasing their operation and are taking in more scrap for their furnaces, while rolling mills and foundries are working practically at capacity and need considerable raw material to meet their needs. While the market to a certain extent is being controlled by dealers their position appears to be strong. Railroad offerings at present are somewhat more numerous but do not aggregate a heavy tonnage. The Southern offers 2300 tons. the Wabash 1750 tons, George W. Jenings 1375 tons, the Santa Fe 1250 tons, the Chicago, Milwaukee & St. Paul 1000 tons, the Chicago, Indianapolis & Louisville 650 tons and the Burlington 225 tons.

St. Louis Market Advances

St. Louis, Nov. 8.—Virtually all grades of scrap have been advanced from 50 cents to $3 per ton. Rolling mills and foundries are crowded with business, and while many of them are well covered by contracts, they have found it necessary to buy additional quantities to provide for recent orders. All the plants have business to carry them through this year, while many report excellent prospects for the future. The situation has been considerably enlivened by speculative purchasing among dealers, and

efforts on the part of certain individuals and firms to cover on material sold short prior to the present bulge. Rolling-mill and iron-foundry grades are difficult to obtain, and during the past few days steel has advanced in sympathy with the general market. Rerolling rails are in special demand and would easily bring from dealers $31, an advance of $2.50 over the preceding week. Car axles are up $2, and heavy melting steel is quoted at $20 to $20.50, against $18.50 to $19 ten days ago. On Nov. 5 the government, sold 1300 tons of steel ingots at the plant of the American Steel Foundries at the highest bid of $22.05. Relaying rails are in urgent demand, with none offering. An inquiry was received here for 25 to 30 miles of 60 to 75-pound rails from a railroad in Louisiana, no part of which could be handled. Cuban sugar interests and oil companies in the Southwest have orders for all the relayers obtainable.

Conditions Are Improved

Cincinnati, Nov. 10.—A general feeling is prevalent that a turn in the market is very close. An improvement in the car situation has enabled dealers to resume outside shipments. All prices have been advanced. Cupola-size foundry scrap is in good demand and there is also a better call from outside melters for heavy melting steel. Short length steel rails are also wanted more freely. While it cannot be claimed that there is a marked improvement, conditions are much more satisfactory than at this time last week.

Stock Bars Raised

New York, Nov. 10.—Prices on steel bars, ¼-inch thick and heavier, out of warehouse, have been advanced $3.00 per ton to 3.52c, New York. A similar advance has also been made in soft steel bars, ⅜-inch thick and lighter, and in hoops. the New York price on the former being 4.22c and on the latter, 4.47c. Other quotations in the local warehouse market continue unchanged, although an increase is being expected almost momentarily in sheets. Stocks of this latter material are steadily diminishing, mill shipments being exceedingly difficult to obtain. Demand for virtually all descriptions is heavy.

Prices Are Raised

Philadelphia, Nov. 11.—Philadelphia jobbers have abandoned the Pittsburgh basing system on prices. They have made no change in prices in Philadelphia district but they are asking the following on out-of-town shipments: Steel and iron bars 3.50c, bands 4.20c, hoops 4.45c, plates 3.75c, shapes 3.45c, excepting when New York and Baltimore are lower in which case the prices will be equalized with these points. Jobbers' sheet prices have been advanced both in and out-of-town shipments as follows: Blue annealed 5.00c, black 6.00c, galvanized 7.50c. Warehouses here on bars and shapes are quoting warehouse extras on Philadelphia district business and mill extras on out of town shipments.

Higher Prices

In Sheets May Be Named By Independents—1920 Sales Soon

Pittsburgh, Nov. 11.—A tendency to seek higher prices is noted among independent makers of sheets, but this movement is finding no encouragement from the American Sheet & Tin Plate Co. which, although out of the market as far as new business for delivery during the next few months is concerned, still is holding to the so-called Redfield schedule. The position of the independent makers with regard to early shipment business is not much better than that of the leading interest, both being heavily committed and likely to carry considerable tonnage from 1919 over into 1920. Consumers of sheets of all classes are pressing makers for deliveries against contracts, but the best that the latter can do is to apportion their production. Mill operations are still gaining, the American Sheet & Tin Plate Co. now having 91 per cent of its capacity in operation, while resumption in Newport, Ky., Canton, O., and in the Youngstown, O., district has brought up independent mill operations.

Hard to Obtain Black Sheets

Philadelphia, Nov. 11.—The plant of the Alan Wood Iron Co., which was shut down for five weeks is operating again and shipping. Black sheets, No. 28, are now bringing 4.85c, but are practically unobtainable. Blue annealed sheets have been sold at 3.65c to 3.75c. Galvanized sheets are sold at 5.80c to 6.00c. One reseller is asking 6.10c, Pittsburgh, for No. 28, black, due to the scarcity here. American exporters have bought English sheets for shipment to Japan, Belgium and England, becoming factors in the export sheet market.

Hard to Place Business

Chicago, Nov. 11.—Steel sheets seem to be in heavier demand than any other form of finished steel and all makers are besieged with inquiries for lots ranging from 500 tons to 10,000 tons each. Not only are domestic users seeking large supplies but foreign demand is heavy, and unusual premiums are offered to get orders on mill books. Sheet mills in this territory are out of the market.

Heavy Demand in Valley

Youngstown, O., Nov. 11.—Sheet market conditions throughout the Mahoning valley are similar to those during the war. Mills are loaded to capacity with business, which will require steady rolling for several months. In most cases books remain closed, buyers finding it extremely difficult to locate sheets of any grade under three months' delivery. Production has been hindered somewhat by strike conditions, and since the mills here are just beginning to get back on their former operating basis managers find they have all the business they can handle until well into 1920. The policy which is being followed to a large extent by the mills is to work up present orders before taking on additional business. The demand is particularly heavy for galvanized and black sheets in the lighter gages. As far as can be learned, it is useless to try to buy this material from valley makers. Stock of No. 26 gage and lighter cannot be had, because makers feel they cannot afford to roll such specifications when more attractive orders are in hand. Export buyers particularly are clamoring for light gage material. Various premiums are being offered.

Acute Shortage

Shown in Semifinished Material—Odd Sheet Bars Bring $45

Pittsburgh, Nov. 11.—While the Carnegie Steel Co. now is operating close to 75 per cent of ingot capacity, and more open-hearth and bessemer furnaces are in operation in the valley districts than before since the outbreak of the strike, production still is considerably behind demand. Consumers needing early supplies find it extremely difficult to pick them up. The shortage is acute in all classes of semifinished steel, but is especially so in sheet bars for the reason that the recovery at sheet and tin plate mills from the strike has been more rapid than with other classes of finishing mills. It probably would be impossible to obtain tonnages of sheet bars today at less than $45, Pittsburgh or Youngstown, and some consumers whose needs are urgent probably would pay more. Small sales of standard bessemer billets are reported from the valley for shipment east at $42, and it is understood another small lot running rather high in sulphur is under negotiation at the same price. The last business reported in wire rods was at $60 for soft steel.

The open market business in semifinished steel is very much restricted by the fact that practically all of the current production is required to meet contract obligations.

Sell Slabs at $47.50

Philadelphia, Nov. 11.—Slabs are selling at $47.50 delivered eastern Pennsylvania and this is the market here. Rerolling billets are bringing $45 to $47.50 delivered and forging $55 to $60. Fair tonnages of all these grades have been sold.

Steel Bars Are Scarce

Cleveland, Nov. 11.—Sheet bars for early delivery are in exceedingly strong demand but practically no supplies are available. One lot of odds and ends which have been accumulated for some time was sold by a mill in this district on the $45 basis.

Strip Output Limited

Pittsburgh, Nov. 11.—The situation in strip steel remains extremely taut for while makers in this part of the country, with one exception, are unaffected by labor conditions, general production still is far below normal and only a few manufacturers are anywhere nearly abreast of their contract obligations. It is doubtful if either hot or cold rolled strip steel could be had for prompt shipment except at premiums over the March 21 bases.

Bar Contracts Refused

Makers Confine Attention to Filling Old Orders—Big Tonnage to be Carried Over—Bar Iron, Nuts, Bolts and Rivets Up

Chicago, Nov. 11.—Demand for finished steel is strong from all sources, and not much is available for 1919 delivery. Bookings the past week in soft steel bars as well as other finished steel products were the heaviest in a long time. The same thing applies to specifications on existing contracts. All contract holders seem inclined to specify to the full in order to receive as much material as they can at the earliest moment. Operation and production at local mills are being increased steadily, an indication of this being the operation of the rail mill at Gary on two turns, covering the entire 24 hours. It is practically impossible now to place new contracts for soft steel bars with local makers, both of whom decline to obligate themselves further. Some eastern makers are still able to take business, and premiums as high as $6 per ton over the present quotation of 2.62c, Chicago, have been made. However, this is not general and applies to comparatively small tonnage.

Makers of bar iron are increasing their price gradually as the general level of the scrap market advances and as they are faced by a probable increase in the cost of fuel. While the quotation has been 2.45c, Pittsburgh, or 2.72c, Chicago, sales have been made as high as 2.60c, Pittsburgh, or 2.87c, Chicago. However, the latter figure is higher than the average quotation which probably is close to 2.77c, Chicago mill. All present demand for bar iron is for prompt delivery and demand continues to be greater than production, piling up tonnage on mill books to some extent.

Most producers of hard steel bars rerolled from rails have sold their entire production for 1919 and are unable to take on additional business.

Steel Bars Scarce

Philadelphia, Nov. 11.—Consumers of iron bars say they can buy at 2.60c, Pittsburgh, although some makers are asking 2.75c. Steel bars are hard to get. Good tonnages placed some months ago by exporters are now being sold abroad by the latter at 2.50c and 2.60c, and in some cases, 2.85c and 3c, Pittsburgh.

War Conditions Return

New York, Nov. 10.—Makers of steel bars say that consumers apparently are just beginning to become aware of the extent of the present scarcity in this product. In fact, the makers say, present conditions as regards the supply of steel bars, now are almost as bad as prevailed during the war when consumers were able to obtain their requirements only in accordance with the rulings of the priorities division. With the mills sold up far ahead, buyers are making urgent pleas for new tonnage. In many cases they are anxious to place big tonnages and are bidding such prices as 2.75c and 2.85c, Pittsburgh, as inducements. The jobbing trade, particularly, is anxious to obtain big tonnages at any reasonable premium. Exporters say that it is practically impossible for them to obtain steel bars.

Further Advance in Bar Iron

Pittsburgh, Nov. 11.—A further advance of $2 a ton has just been announced by the leading makers of iron bars in this district putting the market on a basis of 3.10c for common merchant iron and 3.35c for refined. Not only is the demand for iron bars extremely heavy, but the scrap material used in making these bars has risen sharply. Iron axles which could be bought recently around $34 to $35, have sold as high as $40 and $41. While some demand for iron bars is occasioned by the shortage of soft steel bars, it is the needs of regular users of iron bars that are giving the market its strength. Chain makers are showing more interest. The situation in merchant steel bars still is taut, although the past week has developed some improvement in production. Practically all of the bar mills of the Carnegie Steel Co., at Youngstown, now are in operation and a portion of them are running double turn. With the other Youngstown manufacturers also starting up, supplies should gradually work easier. At the same time it probably will be several months before supplies are up to the point prevailing just before the strike. One valley maker is understood to have orders on his books for 150,000 tons of bars of various sizes. All makers are heavily committed on the smaller sizes of rounds and squares. The general quotation remains at 2.35c, Pittsburgh, but no new business is being accepted at this figure and it refers chiefly to deliveries on old contracts.

Carry Over Big Tonnage

Cleveland, Nov. 11.—Steel bars are extremely scarce and as the mills will carry over into next year a large unshipped tonnage, they remain reluctant to take on additional orders for first quarter. A number of the manufacturing consumers continue to urge acceptance of this business. Prices are nominally unchanged but it is apparent that buyers would be willing to pay advances could they be accommodated. Small rivets again have been advanced, effective Nov. 7, to 50 and 10 off.

Schedule is Advanced

Chicago, Nov. 11.—An increase of about 15 per cent in prices on bolts and nuts has been put into effect by practically all makers in the face of increased cost and an unusually strong market. On nuts the advance ranges from $8 to $12 per ton, while on bolts it is about 15 points. This went into effect Nov. 7. Bolt makers have inquiry for much more material than they can accommodate and it is becoming increasingly difficult to place new business.

Production Still Behind Demand

Pittsburgh, Nov. 11.—Although the makers of cold-finished steel bars who make their own steel are operating normally, the plants dependent on outside sources for supplies of merchant steel bars are considerably hampered because of the restricted shipments of the latter against contracts. Generally, production at the moment is considerably behind the demand with the builders of automobiles and tractors, and the accessory manufacturers, pressing heavily for supplies. Accessory manufacturers are particularly anxious to obtain supplies of bessemer screw stock.

Premiums for Early Shipment

Pittsburgh, Nov. 11.—While makers of hoops and bands generally are holding to the March 21 base of 3.05c, base Pittsburgh, it is reported that premiums of as much as $5 to $10 a ton have been paid for bands for early delivery. Makers are heavily committed on both hoops and bands and while production is gaining steadily, it still is necessary to apportion it among consumers.

Market is Stronger

Pittsburgh, Nov. 11.—Shortage in the supply of rods and steel bars is beginning to find reflection in the production of steel chain and the market which recently was inclined to droop in the absence of much buying has stiffened perceptibly. Demand has increased and makers, from a condition where prompt shipments were readily made, now are finding it hard to keep up with their orders. The base price remains at $5.75 per 100 pounds, base Pittsburgh, for 1-inch proof coil, but sizes running from ⅜ to ¾ inches inclusive, have advanced. The increase is 50 cents on ⅜-inch chain, 35 cents on $\frac{7}{16}$ and 25 cents on ½ and $\frac{9}{16}$, ⅝ and ¾ inch. The prices of chain made from iron bars incline higher because of the strength of the latter product.

Quiet Market

Prevails in Ferroalloys—Some Spiegeleisen Sold—Ferrosilicon Firmer

New York, Nov. 10.—Some carload business has featured the market in spiegeleisen and this has been done at $35 furnace, for 19 to 21 per cent. There is a lack of inquiry with which to test out the market on bigger tonnages. In ferromanganese, the market is featureless. No offers are being made on English metal and the market is largely nominal at $110 delivered on domestic 78 to 82 per cent metal. Some business has been turned away at this price, it is said. Electrolytic ferromanganese has been offered on the Pacific coast by makers in that district at $120 furnace for 78 to 82 per cent.

The situation in special steelmaking ferroalloys shows little change. Less has been heard recently of offerings of British and French ferrotungsten and ferrochrome and the ferrochrome market in particular is reflecting this in increased strength. Inquiry for

ferrochrome has been fairly broad and brisk. No prices below 27 cents a pound contained now are being heard on alloy containing 4 to 6 per cent carbon and some makers are asking about 30 cents for this grade. English makers some time ago sold good sized lots as low as 20 cents, delivered, duty paid.

The British makers of ferrotungsten also sold some alloy in this market at considerable concessions, as low as 95 cents a pound contained having been done some time ago. It is understood this material was low in manganese but rather high in tin and copper. Some low prices also were done on tungsten powder. On the other hand, domestic producers have been obtaining from $1.15 to $1.25 a pound contained for their product.

The market for ferrovanadium is firm. The leading seller continues to quote $5.50 a pound contained for alloy running above 1 per cent in silicon, another seller is quoting $5.95 a pound while other sellers are obtaining $7 and higher for metal running below 1 per cent silicon.

The ferrosilicon market has been somewhat stronger following sales below $80, delivered Pittsburgh district, for 50 per cent.

80 Per Cent Sold at $110

Philadelphia, Nov. 11.—Several carloads of 80 per cen ferromanganese have ben sold at $110, delivered, and some 60 per cent is now being offered. Numerous small lots of spiegeleisen, totaling more than 1000 tons have been sold at $35 furnace, for 18 per cent, at $34, furnace, for 16 per cent.

Prices Favorable to Buyers

Pittsburgh, Nov. 11.—Current demands for all kinds of ferroalloys are light in this market and generally prices are in favor of buyers. Although domestic makers of ferromanganese at present are not having much competition from English producers, they are finding it difficult to interest consumers in 80 per cent material at $110, delivered, and it is intimated small sales have been made at concessions of $2 to $3. Some business is reported in 18 to 22 per cent spiegeleisen at around $34, furnace. It is being pointed out to the steel manufacturer using either spiegeleisen or ferromanganese that the latter is much the cheaper material. To obtain the same amount of manganese as in a ton of ferromanganese, four tons of spiegeleisen at $34 a ton would mean $136 as against $108 to $110 for 80 per cent ferromanganese, without regard to freight charges.

Sales of 50 per cent ferrosilicon run in small lots with the great bulk of them at $80, delivered Pittsburgh. Most domestic makers of this material are quoting at least $85 and some run up to $100.

All makers of bessemer ferrosilicon now are quoting a basis of $54.75, furnace, for 10 per cent. Demands are not especially heavy, but production for some time past has been extremely light.

Spiegel Tonnage Closed

Chicago, Nov. 11.—An important manufacturer of car wheels in this district has closed for 2000 tons of spiegeleisen with an eastern maker at a price understood to be $35 furnace.

Plate Mills Filled Up

Eastern Makers Have Months of Work Ahead—One Producer Advances to 2.75c—50,000 Tons of Ship Steel Up at Chicago

Philadelphia, Nov. 11.—Eastern plate mills as the result of big demand now are booked to capacity for two to three months ahead. The demand is coming from all sources except the railroads and even the latter source now is developing. The Pennsylvania railroad placed 2000 tons of plates for 50 locomotives to be built at Altoona. The American Car Foundry Co. placed 15,000 tons of plates for tank cars. Many sheet consumers unable to get that material are asking the plate mills for light gages but latter are dodging this business because it is only of temporary character and because of trouble in rolling such gages. As a result of the big demand for the heavier gages the Lukens Steel Co. advanced its price to 2.75c, mill or Pittsburgh. Exporters say it is difficult to get plates at 2.65c Pittsburgh, whereas they can sell all they can get at this figure. England is placing some plate orders with eastern mills. The navy is expected to put out an inquiry soon for heat-treated plates for battleships.

Little Tonnage for Early Delivery

Pittsburgh, Nov. 11.—Makers of plates in this district have become so well sold up on demands resulting from the crippling by the strike of plants in other districts, that they have little tonnage available for prompt shipment. One Pittsburgh company which temporarily was out of the market is offering limited tonnages of grooved plates in the heavier gages. The Pennsylvania railroad has just received instructions from the railroad administration to build 50 passenger locomotives at its own lines. Not much demand is coming here for ship plates, but builders of tanks and the fabricating interests are persistent buyers. The Carnegie Steel Co., is holding at 2.65c, Pittsburgh, for plates and because of that fact independent makers here are not inclined to seek any advance.

Eastern Mill Raises Prices

Cleveland, Nov. 11.—A leading eastern plate maker who has been selling on the basis of 2.65c, mill, or 2.92c, Cleveland, has withdrawn this price. While he is not anxious to quote for next year's delivery, he is naming an advanced figure of 2.75c, mill, to buyers who insist upon a price. It is learned that some of the merchant vessels of canal size upon which shipyards in this district were figuring for France have been lost to some continental European country, probably Germany, because of the lower price in which the depreciated exchange figured largely.

Cars Take Much Tonnage

Chicago, Nov. 11.—Contracts with carbuilders for repairs of railway equipment are bringing considerable tonnages to the mills and the leading interest last week booked about 35,000 tons for this purpose. This is an aggregate of several contracts. The greater portion is for car repairs, although some is for the construction of new tank cars. While some shapes and bars are included in this total, by far the greater part is plates. An inquiry for steel for five to ten tankers has been put forth by a Pacific coast shipbuilder which will require from 20,000 to 40,000 tons of plates. Four other tankers already on inquiry are still pending and these two inquiries represent about 50,000 tons of steel, mostly plates. The current quotation on plates remains at 2.92c, Chicago.

Round Tonnage

Of Cast Pipe Sought By Cuban Interests—Mill Output Grows

New York, Nov. 10.—From 12,000 to 15,000 tons of cast iron pipe are being sought in this market by a Cuban interest. In addition, several inquiries were issued last week by South American interests. The tonnages involved, however, are considerably smaller. Eastern pipe makers also report a good quantity of demand from water companies and other private buyers. One particularly good tonnage is said to be included. Public demand, however, continues exceedingly dull. Prices are strong at last week's levels.

Sold Well Into Next Year

Pittsburgh, Nov. 11.—Makers of tubular goods, both steel and wrought iron, have business in sight now that hardly will be filled until well into 1920. All makers were booked to the end of this year when the strike broke out and large tonnages now will be carried over into next year, despite the fact that practically no new business has been taken recently. Most companies are entering the orders of their regular customers but are giving no guarantee as to deliveries. The recent advance announced by the A. M. Byers Co. hardly will be effective before the second quarter as that company has enough business now on its books to carry it through the first three months of 1920 and this carries the prices in effect prior to Oct. 28. Pipe mill operations are gaining steadily. Conditions with the National Tube Co. and the Jones & Laughlin Steel Co. continue favorable.

Lettings Are Slow

Chicago, Nov. 11.—Comparatively little tonnage of cast iron pipe has been sold the past few days, probably due largely to end of the season being close. Bids were opened last week at Chadron, Nebr., on an inquiry for 1200 tons of pipe, most of which was for a supply line. On account of present prices of cast iron pipe, this will be laid with wood pipe and only 100 tons of cast iron pipe was bought from the United States Cast Iron Pipe & Foundry Co.

New Work is Held Back

Delays in Mill Shipments of Shapes are Factor — Further Shortage is Feared—New Awards are Fair

Philadelphia, Nov. 11. — Well-informed steel men here predict a great scarcity of shapes when railroad buying and new construction gets in full swing. They say that new shape capacity is far behind its proper proportion to plate capacity. Eastern shapemakers report a large demand, and they are booked several weeks ahead, and in some instances two months. Increasing prices of pig iron and scrap are worrying some of the mills, and one maker has adopted a policy of taking orders only when they will net him more than 2.55c, mill. Makers say present demand is larger than at any time since the armistice.

Mills Well Sold Up

Pittsburgh, Nov. 11. — Although shape mills in the Pittsburgh district at the outset of the steel strike were poorly provided with orders, they since have had a generous influx of business and now are so heavily committed as to be unable to give much consideration to new business except in beams, angles and channels of sizes in which the demand has been light.

Fair Demand at Cleveland

Cleveland, Nov. 11.—Demand for structural material continues in fair volume, but some difficulty is being encountered in obtaining delivery, one of the leading fabricators in this district having had to reject a number of offers during the past week owing to the fact that material could not be promised in time to meet the plans of the prospective purchasers. The largest job to come up for bids during the past week is one involving 5000 tons for the First & Old National Bank building, Detroit, which is to replace the Hotel Pontchartrain. The Superior Sheet Steel Co., Canton, O., is inquiring for 650 tons for a new building. A dozen or more jobs in this district on which bids have been taken during the past week are still to be awarded. A preliminary lot of work about 4000 tons in the form of overhead bridges, in connection with the new Cleveland union station, is expected out soon.

Shapes Lag in West

Chicago, Nov. 11.—Structural shapes are in somewhat less demand than either bars or plates, but a fair volume of this business is coming to mills, and much building is going on throughout the western territory. In Chicago proper fabricating is unusually slow, as a result of a strike of employes of bridge shops. Plain material is steady at 2.72c, Chicago, with no tendency toward a change.

Spring Work Being Let

Boston, Nov. 10.—Mills again have opened their books for 1920 structural shapes, and new work in New England planned for the early spring is being let. An increase in activity among fabricators is reported the past week. Most of the large work is for next year construction but the aggregate of small jobs requiring structural steel has increased favorably. The new telephone building in Boston which was let last week will require 857 tons.

CONTRACTS AWARDED

Open-hearth foundry and scrap-handling crane runway for Interstate Iron & Steel Co., Chicago, 1500 tons to the Worden-Allen Co.

Structural steel for buildings No. 22, 23 and 25, for the Western Electric Co., Hawthorne station, Chicago, 2723 tons, to McClintic-Marshall Co.

Building for Omaha Cold Storage Co., Omaha, Nebr., 707 tons, to Omaha Structural Steel Works.

Snake river bridge near Pasco, Wash., 630 tons, to Minneapolis Steel & Machinery Co.

The Pinacea theater, Chicago, 588 tons, to Duffin Iron Works.

Eleven story annex for the Canal Commercial Bank building, New Orleans, La., 310 tons, to McClintic-Marshall Co.

Steel framing for warehouse for Concrete Steel Co., Chicago, 249 tons, to Continental Bridge Works.

Marshfield theater building, Chicago, 227 tons, to Wendnagel & Co.

Foundry building at Atchison, Kans., for Cooper Foundry Co., 207 tons.

Central exchange building for the Northwestern Telephone exchange of Duluth, Minn., 205 tons, to National Iron Works.

Blacksmith, tankshop and garage, for the General Electric Co., Fort Wayne, Ind., 161 tons to H. K. Ferguson Co., Cleveland.

Theater building at Hammond, Ind., for S. J. Gregory Theatrical Co., 124 tons, to Central States Bridge Co.

Tank construction, Standard Oil Co., 155 tons to White & Conley.

Loft building for Julius Kiselman & Son, thirty-sixth street and Seventh avenue, N. Y., 1000 tons, to Hinkle Iron Works.

Theater building, Philadelphia, 700 tons to the American Bridge Co.

Plant at Chrome, N. J., 400 tons placed through Westinghouse, Church, Kerr & Co., Inc., New York, with independent fabricator.

Bridge for Norfolk & Western railroad, 500 tons to a Columbus fabricator.

Building for Ball Engineering Co., Erie, Pa., 150 tons to Fort Pitt Bridge Co.

Bankers building, Boston, 350 tons to New England Structural Co.

Telephone building, Boston, 857 tons to New England Structural Co.

Bank building, Boston, 113 tons to New England Structural Co.

School building, Stamford, Conn., 150 tons to Eastern Bridge & Structural Co.

Factory, Springfield, Mass., 175 tons to Harmann & Co.

CONTRACTS PENDING

Second unit of shop extensions for A. O. Smith Corp., Milwaukee, 4000 tons, bids being taken.

Building for Cole Motor Car Co., Indianapolis, 900 tons, bids asked.

Building for *Denver Post*, at Denver, Colo., 300 tons, bids asked.

Building for state of Colorado at Denver, Colo., 200 tons, bids asked.

Steel for 30-story building for *Buffalo Enquirer*, Buffalo, 3700 tons, general contractors asking bids.

Century theater, Philadelphia, 500 tons, bids being taken.

Boiler house, Toledo, O., 500 tons, bids being taken.

High school, Queensborough, N. Y., 250 tons, bids being taken.

Building for Cleveland Rubber Mold & Foundry Co., 150 tons; bids being taken.

Building for Superior Sheet Steel Co., Canton, O., 650 tons; bids being taken.

Building for First & Old National Bank, Detroit, Mich., 5000 tons; bids being taken.

Newtown high school, Brooklyn, 840 tons, general contract to Conner Bros.

Tin Plate Demand Heavy

Pittsburgh, Nov. 11.—Heavy and insistent demands still are coming out for tin plate for delivery over the remainder of this year and the first quarter of 1920, but are not easily placed. Practically all makers are committed on production for the next 45 days, and as the American Sheet & Tin Plate Co. has not yet opened its books for first quarter and first half business, a tendency is noted to wait on this development before considering 1920 orders. It is reported that a large independent oil interest is seeking to place 100,000 boxes of tin plate as well as a considerable tonnage of tin mill black sheets for January, February and March delivery, but has not found any of the manufacturers in a position to take on this business. The carry-over of 1919 tonnage into 1920 probably will be heavy, for in addition to the interruption to production due to the strike, the report is heard that some tonnage, booked about the middle of the year below the market price then prevailing, has not yet been delivered. Mill operations are on the increase with the American Sheet & Tin Plate Co. now running 70 per cent of its mills and most of the Pittsburgh district independents back to practically normal operations.

Wire Gains

In Output But Backed-Up Orders Remain—Higher Sales Are Made

Pittsburgh, Nov. 11.—Although operations by the makers of wire and wire products most seriously affected by the strike show a steady gain, no appreciable inroads are being made against the business backed up. No maker yet is in a position to do much with new demands. The American Steel & Wire Co. has more capacity in operation in its Pittsburgh district plants than at any time since Sept. 22, and the return of workmen has permitted the running of some capacity on a double turn basis. Production is rising as operations increase. The Pittsburgh Steel Co. and the Page Steel & Wire Co., both at Monessen, Pa., steadily are working out the effects of the strike and the Youngstown Sheet & Tube Co. is coming back to normal conditions. It is considered likely, in view of the activities recently of the workmen who want to work and the citizens' committee in Johnstown, Pa., that a resumption at the Cambria works of the Midvale Steel & Ordnance Co., will be attempted soon. Sales of nails recently were made by a manufacturer at $5.50 a keg and of plain wire at $6. The circumstances surrounding these sales, however, were that the consumer had to have supplies and the manufacturer never before did business with the buyer and does not expect to again. The American Steel & Wire Co. is taking no new business.

Mills Doing Better

Chicago, Nov. 11.—Considerably better delivery is being made on wire and nails, although the situation is still far from satisfactory. Tremendous demand is being made on mills, especially for nails, as a virtual famine in this product is developing. Enlarged building operations all over the country have pulled down reserve stocks in the hands of jobbers, and the cry for more nails is going up from all directions.

Exporters Again Accept Orders

Demand for Iron and Steel From Abroad Grows Insistent—Big Traders Close Their Books on Account of Shortage of Supplies, Then Reopen Them—Smaller Houses Report Phenomenal Activity — Prices Advancing

NEW YORK, Nov. 10.—Refusal of the two large interests in the iron and steel export field to accept further orders of any considerable size has been terminated and the United States Steel Products Co. now is understood to be accepting business. It has taken an order for 20,000 tons of open-hearth rails for first quarter delivery from Belgium at a reported price of $52 mill. While the ban on sales remained it resulted in a sharp increase in business done by the more stable of the miscellaneous independent export houses. One did more business during October than any month this year, and the tonnage closed this month has been unusually large. The same report was received from the local representatives of foreign purchasers of whom there are a large number in this market. They report a heavy demand from abroad, although they complain of the prices it is now necessary to pay American producers.

One international trading house has received a quotation from a German producer which indicated that Germany is able to undersell us on sheets. The price is approximately $6 under the American market on sheets, when taking the rate of exchange into consideration. It was also announced that the French are now underselling American mills on bars, and the Belgian producers are underquoting on a number of products. It was declared by some of the international traders that, due to the higher prices American producers are asking, export trade with Europe is probably only 25 per cent of what it might be.

The stand taken by the Consolidated Steel Corp. and United States Steel Products Co., however met with much favorable comment among foreign purchasers. While these two big export houses determined to curtail foreign business, their old customers were not entirely neglected. It was possible to place orders with them in sizes up to several hundred tons. Other export houses say that it is practically impossible to purchase bars, especially small sizes, or small-gage sheets. Tin plate and other products are extremely scarce, but the independents say that they have been able to fill all new orders for other lines. Recently a Japanese inquiry for approximately 6000 tons of sheets was turned down because the material was not available. Certain sizes of pipe are almost unobtainable.

Despite the curtailment of supplies for export the big producers have not advanced their prices. This has served as a stabilizer especially in that business which comes from regular and established customers abroad. The tendency, nevertheless, is toward an advance and the old quotations prevailing prior to the strike are not now in effect even in the case of the leading sellers. The two largest interests have business on their books now that will keep them busy making deliveries throughout the first quarter of 1920. It is anticipated that they will not be ready to open their books to new business much before the first of the new year. It was stated unofficially recently that the United States Steel Corp.'s export business in lighter steel products would be temporarily suspended on account of the sold-up condition of the domestic plants. The Consolidated was said to be doing practically the same, some lines handled by this corporation having already been withheld from overseas business because of the effects of the steel, coal and longshoremen's strikes.

Trade of the independent houses with South America and the Orient has been growing regardless of rising prices. The Oriental inquiry for nails is normal although the product is difficult to find. Japan has purchased 1000 tons of plates and 700 tons of sheets. The price for the sheets was $5 per 100 pounds, Pittsburgh. An effort is being made now to place another Japanese inquiry for 600 tons of plates for first quarter delivery. Japan has also inquired for 2000 tons of rails. An inquiry for 3500 cases of tin plate also is noted, as well as various Japanese inquiries for small tonnages of wire, etc.

There has been rather heavy buying in the market on Oriental account. A sale of 1000 kegs of nails to Rangoon, India, was reported, and a sale of 600 tons of steel boiler plates to Shanghai. A large number of small orders for light steel products were accepted from Hongkong, Wellington and Melbourne.

South America has been taking wire chiefly although the sales include the usual long list of light steel products. South American inquiries have been in small tonnages. They include the usual line of wire products, sheets, tin plate, nails and bars. The sales made have consisted chiefly of shipments out of stock. A South American inquiry for 500 tons of sheets is out.

England is said to be suffering from a shortage of tin plate. An English inquiry in this market for tin plate last week caused some comment although it was concluded that the material was desired for filling one of that country's own export inquiries. A small English inquiry for plates also was received.

The Nonferrous Metals

	‡Copper	Future Straits N. Y.*	†Lead, New York basis	Zinc St. Louis basis	Aluminum	Spot antimony	Nickel ingot
Nov. 5	21.00	53.50	6.75	7.65	33.00	8.87½	41.00

*Future shipment from Singapore.
† American Smelting & Refining Co.'s price.
‡Open market.

NEW YORK, Nov. 11.—Despite the coal strike, the metal markets have been holding up well, although many consumers were inclined to hold off purchases until assured of a steady supply of fuel. Today the better news on the coal strike quickly sent zinc up and cheered other metals. News from the steel strike centers has been favorable and tin and zinc sellers look for a decided resumption in demand soon. There has been some export business in copper and zinc, both with Japan and with Europe, but the sterling exchange rates keep export sales to a minimum.

The leading copper sellers have been competing actively for business, meeting the prices of dealers and smaller sellers, and shading 21c. refinery, in cases. The usual quotation on electrolytic for delivery this year is about 21c, New York. Casting is quoted 20c to 20.25c; lake 21.25c to 21.50c. The copper market has been extremely dull, but the prospect for early ratification of the peace treaty is being greeted by large sellers as opening the way for financial arrangements which will stabilize exchange and facilitate the filling of European copper requirements.

Some inquiries for brass special zinc have been received by the zinc producers from brass mills, who long had been conspicuous by their absence from the zinc market. The inquiries were not large, involving only a few hundred tons for shipment this year, but were expected to lead the way to larger business. Galvanizers, who also had been out of the market for a considerable period, renewed their interest and there were indications that a heavy volume of business would be placed for the galvanizers before the close of the month. Prime western advanced in the face of the coal strike, reaching 7.90c, East St. Louis, Tuesday. High grade sold at 8.37½c to 8.50c, New York.

The tin market eased up with the conclusion of the dock strike and the resumption of deliveries from October arrivals. Spot Straits tin, which had sold at 57.00c, or 3.00c above the price of tin on dock, speculative declined, until this week the margin between spot and tin on dock was practically nil, with the former at 53.75c. Futures in all positions were held at about the same figure, 53.50c to 53.75c. Ninety-nine per cent tin, both spot and futures, were held at 53c. November deliveries will be heavy, due to the deliveries from the accumulated supplies in the port, whereas October deliveries were light.

The lead market remained strong, but spotty. Today the outside market was up to 6.97½c. New York, 6.60c to 6.70c, East St. Louis. Consumption of lead appears on the increase.

Some spot antimony sold at 9c. New York, in wholesale lots, an advance of about ¼c to ½c.

Brass rod is down one cent to 24.75c, but other brass and copper products are steady.

American Market Affects British

Blast Furnaces Resume and Pig Iron Market Gains Strength on Report of Advance in United States—Shortage of Semifinished Material Almost Reaches Famine Proportions—Strike Here Helps Tin Plate

Bureau of THE IRON TRADE REVIEW,
Prince's Chambers, Corporation St.,
Birmingham, Eng., Oct. 24.

Rate of Exchange 4.16

NEARLY all blast furnaces have resumed operations, coal supplies increasing during the fine weather of the past fortnight. The few furnaces still idle are completing repairs. It is possible that furnaces in South Staffordshire making cold-blast iron may go out as the molders' strike which may continue indefinitely has seriously affected the large foundries, their men being connected with the three unions on strike. South Staffordshire makes a large proportion of the rolls and heavy mill equipment used all over the country in iron and steel works. The foundries cannot take the iron, which is being stocked at the furnaces. The iron is rather expensive, the selling price being now about £13 ($54.00) per ton, and as no furnace owner expects to get more than 50 per cent of first-class iron out of his make in these days of poor fuel, a good deal of undesirable iron is accumulating. If the strike continues one or two furnaces may go out in a week or two and this will add to the founders' troubles when work is resumed.

There is considerable bitterness over the failure of collective bargaining, the iron founders declaring that if they had been at liberty to negotiate with their men instead of being bound by the engineering federation, they would have settled the question and had their molders at work long ago. It will readily be seen that all interests do not harmonize in this matter, since some molders are making little domestic articles, while others are engaged on big mill castings. Yet all are supposed to be dealt with under the same agreement.

For the present the iron founders consider themselves bound to be loyal to the Engineering federation, with its arbitration arrangements, but if the next effort to settle the strike fails, the great firms probably will take the matter into their own hands, and get their men back to work on the best terms they can obtain.

Prices of pig iron are steady, with no material change. Some buyers claim to have obtained a slight concession in their purchases of Derbyshire iron, but the news conveyed Oct. 23 by the IRON TRADE REVIEW's cable of an advance of $3 in the United States had a marked effect in strengthening the market, and further reduction is unlikely. Makers are booking rather cautiously, in view of the limited output, and there has been little diminution in the demand for foundry iron, notwithstanding the strike, as portions of foundries are in operation,

The average price of West Coast hematite pig iron for the September quarter was £10 4s 10d ($42.43) per ton, giving the workmen an increase of 31½ per cent in their wages, dating from their first full pay in October. Wages are now 206 per cent above the standard for the Cumberland district, and 201 per cent above for Barrow, Ulverton and Carnforth.

There has been a marked increase in demand for export in the Cleveland district, which has strengthened the market there, and as shipping is improving steadily, the export trade promises to figure much more prominently in the volume of business than at any time since the war started.

The trade is seriously hampered by shortage of cars, a difficulty largely aggravated by the continuance of national control. A short time ago a large smelter in the Cleveland district applied to the government transport department to have the use of 600 cars which were idle, and which were needed to move ore and fuel to the furnaces and convey pig iron to customers. He was met with a peremptory refusal, as the authorities feared the cars might be needed for the government's purposes. That was five or six weeks ago, and the cars have not been used since.

Shortage of Semifinished Material

The country is suffering severely from the scarcity of semifinished steel, which has almost reached famine proportions. In the Birmingham area there is a rerolling mill, with a weekly capacity of 2000 tons. The railroad strike forced the suspension of the mills for a week as the billets have to be conveyed to the mills by rail. During the previous week output amounted to 200 tons and in the week preceding that, 400 tons. Complete suspension appears to be imminent, but the company may obtain a portion of one or two consignments of billets which have arrived from America, chiefly through the port of Manchester. Recent purchases from France and Belgium are due for arrival in November and December, although nobody expects the contracts will be strictly adhered to. Some importing merchants are still inquiring for steel ordered from America as long ago as May. The shortage will be very great during the next month or two, although it is hoped that the strikes at the Welsh steel works which stopped the supply of billets therefrom, will soon collapse.

The news of a rise in the price of American semifinished steel, ranging from $2 to $5 is regarded as adding another serious obstacle.

South Wales is in the midst of a boom in tin plate for which the American steel strike mainly is responsible. Orders are abundant, and the greatest activity prevails in the Swansea district, where Germany is inquiring for supplies.

Galvanized sheets are in much the same position, but in this department production is hampered by the lack of skilled workmen, and there seems no immediate prospect of restarting the numerous mills still idle. At Birmingham this week sellers raised their prices from £33 ($137.28) to £35 (145.60) and then refused to book any more, in view of their limited output and the great uncertainty with regard to the supply of sheet bars. Difficulties in the way of production have been increased by the workmen insisting on bars of certain width.

In the Black Country the coal situation is much easier, enabling practically all the works to make full time. Output could be increased enormously if the 8-hour interval of idleness in each 24 hours could be abolished.

Effort to induce the workers to make some concession in wages has failed. The men are now getting 162½ per cent over their prewar earnings.

One effect of the small output is the inability to handle foreign business. A large works in the Black Country this week received from a London merchant an offer of a contract for 1000 tons of bars for an overseas buyer. The offer was returned without consideration.

Normal Operation Near in Valley

Wholesale Back-to-the-Mill Movement Indicates Work Will be Limited at End of Week Only by Restrictions on Fuel — Eleven Out of 25 Blast Furnaces Now Making Iron — Improvement Continues in Other Districts

YOUNGSTOWN, O., Nov. 11.—Old employes returned for work at the various steelworks throughout the district Monday in large numbers. The movement gives every indication that before the last of the week, the mills will be working as close to normal as will be advisable in view of present fuel conditions. Authentic reports show that 11 out of 25 blast furnaces in the Mahoning valley are making iron and that open-hearth steel production has been increased substantially during the past week.

The finishing mills at the Upper and Lower Union and at the McDonald works of the Carnegie Steel Co., are maintaining practically 100 per cent operation. The officials of this company report the return of more old employes and state that normal production in nearly every department will be reached this week.

At the Republic Iron & Steel Co.'s plant the plate, skelp and tube departments got under way Monday for the first time since Sept. 22. The company has two active stacks at its Haselton plant and expects to get a third in operation this week. Four of its DeForest sheet mills at Niles, O., are rolling.

East Youngstown street cars were crowded this morning with workmen returning with tools to the plant of the Youngstown Sheet & Tube Co. Few pickets were to be seen at the various entrances of this company's plant. Every department was in operation one week ago and the company expects to increase production this week materially. The Sharon Steel Hoop Co. also is maintaining a better operating schedule at its Haselton mills.

The Tod stack of the Brier Hill Steel Co. began blowing Sunday, thus making two active stacks at this company's plant. Only four out of 12 open hearths are idle and preparations now are being made to put these in operation. A number of sheet mills at its Western Reserve and Niles, O., plants also are rolling.

At the A. M. Byers plant, Girard, O., 62 out of 88 puddle furnaces now are making iron as against 27 at this time last week. The company now has its muck bar and skelp departments in operation and expects to resume operations in its blast furnace department soon.

Strike Practically Ended in Cleveland District

Cleveland, Nov. 11.—The steel strike is practically at an end in the Cleveland district, all steel mill and furnace operators reporting resumption of operations at practically 75 per cent of capacity. Officials of the American Steel & Wire Co. report satisfactory progress being made at the various plants. The finishing plant of the Upson Nut Co. is in operation, while the two idle open-hearth furnaces and the blast furnace are being put in shape. The Otis Steel Co. reports operations at its Riverside plant at 100 per cent, while conditions are improving at its Lakeside plant. One blast furnace is operating the other being down for repairs. The McKinney Steel Co. reports operations at practically 75 per cent of capacity, including operation of two blast furnaces and two batteries of coke ovens.

Operations at the plant of the United Alloy Steel Corp., Canton, O., at which place riots were reported several weeks ago, are increasing rapidly. Of 18 open-hearth furnaces 11 are running this week, an increase of five. Conditions have also materially improved at the Stark Rolling Mill, also at Canton.

Strike in Final Stage in Pittsburgh District

Pitsburgh, Nov. 11.—The strike of the steel plant workmen may be said to be in its final stages. While the Cambria works of the Midvale Steel & Ordnance Co., Cambria, Pa., still are down, the fact that a committee of citizens of that city together with a number of steel plant workmen who are desirous of going back to work recently escorted William Z. Foster out of the town, and that other labor agitators also have been ordered to leave, suggests that a resumption at this plant is not far off.

While no break has been observed in the Wheeling, W. Va., district, strong intimations have been heard that the men are getting tired of idleness and that before long a break in the strike is probable. In the valley district steady increase both in the number of men at work and in the amount of active capacity is noted, especially in the plants which have been working under an agreement with the Amalgamated Association of Iron,and Steel and Tin Workers. Officials of this organization have been urging members to go back to work.

In the Pittsburgh district, except where the foreign population is large, almost normal conditions have been restored.

The Sharpsville furnace, Sharpsville, Pa., resumed yesterday, as did the stack of the A. M. Byers Co., Girard, O. No. 4 furnace of the Shenango Furnace Co., Sharpsville, Pa., will resume this week. The Struthers Furnace Co., Struthers, O., and the stack of the Stewart Iron Co., Sharon, Pa., still are on the idle list. The Carnegie Steel Co. has increased its active stacks by two since a week ago, now having 41 in blast.

Mills in Chicago District Have Steady Output

Chicago, Nov. 10.—Except at the Joliet plants of the Illinois Steel Co., and the American Steel & Wire Co., the steel strike is over. At Joliet the situation has not cleared and workers are still out, rendering operation intermittent and difficult. At Gary, South Chicago, Indiana Harbor and Milwaukee all mills are running. The Inland Steel Co. now has in operation as many mills as it was running when the strike began. The Illinois Steel Co. has started full operation of its rail mill at Gary, running 24 hours in two shifts. This interest has nine blast furnaces out of 12 at Gary producing iron and eight out of 11 at South works. Practically all mills in all plants are now manned sufficiently to give a steady output.

Donner Operating Mills

Buffalo, Nov. 11.—The Donner Steel Co. has resumed operation of its two bar mills and expects to operate its plate mill within a few days. Strike leaders by means of intimidation succeeded during the past week

in inducing 150 men employed by the Buffalo Corrugated Bar Co., Blasdell, N. Y., to quit work, forcing the company to suspend operations.

Regional Committees Are Distributing Fuel

Washington, Nov. 11.—The fuel administration's control over bituminous coal is in full force under the direction of the railroad administration. Essential fuel requirements, including those of manufacturers, are being administered through a central distributing committee named by Director Hines and headed by Henry B. Spencer, director of purchases for the railroad administration. H. A. Garfield, fuel administrator, is in Washington advising and assisting Mr. Hines and transferring to him such duties under the fuel laws as are necessary in handling the curtailed coal output. The organization is practically on a war footing with conservation and priority the two controlling factors.

The central committee has numerous regional and district coal committees, which have been appointed by Mr. Hines, which handle the fuel problems in the territories under their respective jurisdictions. Mr. Hines, in naming the committees, urged on all consumers to make their essential coal requirements known to the railroads from which they ordinarily receive their fuel supplies, and if the railroads cannot meet the individual problems, the committees may, as far as more essential public needs and the fuel supply permit.

Pollak Steel Co., Purchases Rolling Mills

The Pollak Steel Co. has completed negotiations with the Interstate Iron & Steel Co., Chicago, for the purchase of the latter's rolling mill in Marion, O. The purchase includes all contracts, land, buildings, machinery, raw and finished materials at Marion. The Marion mill is in full operation with plenty of orders booked ahead, and its acquisition adds to the Pollak products shapes, angles and bars, including reinforcing bars.

The purchase was in conformity with a policy of expansion adopted some time ago by the Pollak company. It recently completed an extension of its plant at South Chicago, Ill., for the manufacture of drop forgings for the automobile, tractor and agricultural implement trade, and also added to its plant at Cincinnati a large extension for the manufacture of automobile parts. The company for many years has been one of the largest manufacturers of railroad car axles, locomotive forgings and heavy forgings for marine and machine builders. In prewar days the company's trade was principally dependent on railroad buying, but since the war it has made extensive improvements to diversify output. Its latest acquisitions give it a capacity of 300,000 tons a year of forged and rolled products, in addition to the output of specialties, such as automobile parts, and drop forgings which cannot be measured on a tonnage basis.

To Sell Equipment

The Cleveland-Duplex Machinery Co., Cleveland, has closed a contract for the exclusive sale of all machinery which the American Multigraph Co., that city, now has to offer or will have in the future. Equipment now on hand for disposal is valued at approximately $50,000 and additions to this are being made from time to time. Many tools already have been sold.

Big Scrap Lot Sold

Chicago, Nov. 11.—One of the largest, if not the largest deal in scrap material was closed today when Briggs & Turivas, of Chicago, New York and Montreal, bought from the government 141,000 tons of steel shells located in about 10 cities. This material is classed as low phosphorus heavy melting steel. The same buyer also closed for 30,000 tons of similar material in Montreal a few days ago with the Imperial Munitions Board of Canada. This makes a total of 171,000 tons of shells involved in the two deals.

The shells bought from the United States government are located as follows: At Cleveland, 30,000 tons, at Pittsburgh 40,000 tons, at Boston 13,000 tons, at St. Louis 12,000 tons, at Cincinnati 8000 tons, at Rochester 3000 tons, at New York City 3000 tons, at Philadelphia 2000 tons, and at various other cities, principally Toledo, 30,000 tons.

Building Steel Plant

The Kansas City Bolt & Nut Co., Kansas City, Mo., has started construction of additions to its plant to house two 50-ton open-hearth furnaces, a 22-inch mill and the necessary finishing buildings. Steel from the open hearth will be cast into ingots, 10 x 10 inches, part of which will be rolled to billets on the 22-inch mill and finished on the 16-inch and 10-inch mill for use in the bolt and nut department and sold as merchant bars and reinforcing bars. The remainder of the ingots will be finished on the 22-inch mill into larger bars, billets and structural shapes for the market.

The open-hearth furnaces and the heating furnace will be operated on fuel oil. As soon as the two furnaces in the initial installation are completed and in operation the company will begin construction of a third furnace, and the plant is laid out for the addition of a fourth and fifth when circumstances make this advisable. The first two furnaces are expected to go into operation about April 1.

Rail Tonnages

Continue Under Negotiation in East and West—Tank Cars Placed

New York, Nov. 10.—Since the Pennsylvania railroad put out its inquiry for 200,000 tons of rails for 1920 delivery, week before last, other eastern roads, it is found, are planning to take action in connection with their rail needs. The New York Central now is making up the tonnage which it will need for 1920 and an inquiry may come out from this line within a few days, for several hundred thousand tons. The Erie railroad needs 30,000 tons of rails to be laid in January, February and March, but may buy only 20,000 tons in case 10,000 which were loaned to other roads at the instruction of the railroad administration are returned.

Tank Cars Placed

Philadelphia, Nov. 11.—The Union Tank Car Co. has placed orders for 4000 tank cars with various builders.

Car Building Slack

Nov. 11.—Practically nothing is being done in the way of building new railroad equipment and most shops are engaged in repair work, of which a large total is being contracted by the railroad administration. Contracts recently booked for repairs have called for about 35,000 tons of steel from the leading interest here. The Pullman Co. has resumed building standard sleeping cars after having been out of that market for several years. The N., C. & St. L. railroad has let a contract for 11 passenger cars to the American Car & Foundry Co. The leading interest has booked 340 tons of pressed steel parts for the Burlington railroad for use in constructing coal cars.

Rolls Strip Steel in Long Lengths

Vertical Guides Near Last Finishing Stand of New Strip Mill in Chicago Impart Oscillating Motion to Product as It Slides on Edge to Coilers— Strips Close Annealed in Muffle Furnace

BY G. H. MANLOVE

WITH a white-hot steel ribbon, 0.035 inch thick, about an inch wide and 1500 to 2500 feet long issuing from a mill at a speed of nearly 30 miles per hour, the chances for the piece buckling or cobbling seems unusually propitious. The steel ribbon is too soft to carry itself down the cooling bed at that speed, and a bed half a mile long is out of the question. This was only one of the problems which presented themselves when the Acme Steel Goods Co., Chicago, set out more than a year ago to produce hot-rolled strip steel in long strands and at a lower price than the market afforded. The problems have been solved, and the mill is now engaged in reducing a billet 30 feet long and 1½ inches square into a single steel band 1500 feet long. A billet 2 inches square yields a string 2500 feet long. Two continuous-type mills, which are arranged in tandem and function under an unusually delicate speed control, effect the change from billet to strip.

The problems of the new installation were attacked early in 1918 by James E. MacMurray, president of the Acme company, the Morgan Construction Co., Worcester, Mass., and the General Electric Co. The first billet was converted into strip steel Aug. 15 of the present year. Production now has been increased to 150 tons per day, on a double-turn basis. Billets are fed into a Morgan-type heating furnace, 30 x 25 feet, which will accommodate either 1½ x 1½-inch or 2 x 2-inch billets. The furnace is heated by producer gas. An automatic Hawthorne-type pusher, which is operated electrically, delivers the heated billet to the roughing rolls.

The roughing mill includes six stands of rolls with an edging mill placed between the fifth and sixth stands. By means of this arrangement the strip is given a true edge just before the last roughing pass. Between the roughing and finishing mills is another edger, which is driven by an independent motor. The finishing mill includes five stands of rolls, with provision for a sixth stand. The first set of roughing-mill rolls operates at about 19 revolutions per minute, while the last set of the finishing-mill rolls operates at about 800 revolutions per minute. The rolls are 10 inches in diameter, giving a delivery speed close to 2500 feet per minute.

The roughing-mill rolls are driven by a 1000-horsepower motor and the finishing-mill rolls by a 2000-horsepower motor. Each of the latter are equipped with special controls by which the speed of any set of mill rolls can be varied by a single operator stationed in the pulpit overlooking the roll stands. About 500 horsepower additional is supplied by motors operating the edging mills, furnace, pusher, conveyor and other appurtenances. The entire electric equipment is housed in a room inside the main building. The latter is separated by a fireproof wall and is covered by a removable metal ceiling which allows the crane to be used in installing or handling machinery in the room.

After passing between the last set of finishing rolls, the ribbon of steel, which has been formed flat on the horizontal rolls, passes through a guide. This turns it on edge, in which manner it is conveyed to the electrically-driven coilers. At this point the difficulty mentioned at the beginning of this article presents itself. It has been solved in an interesting and rather spectacular way. The strip passes between parallel vertical guides which are pivoted at the end nearest the mill and give an oscillating or vibrating motion in a horizontal plane. This throws the advancing strip alternately to each side of the conveyor table and deposits it on edge in wide loops, similar to the figure 8. By this means of delivery

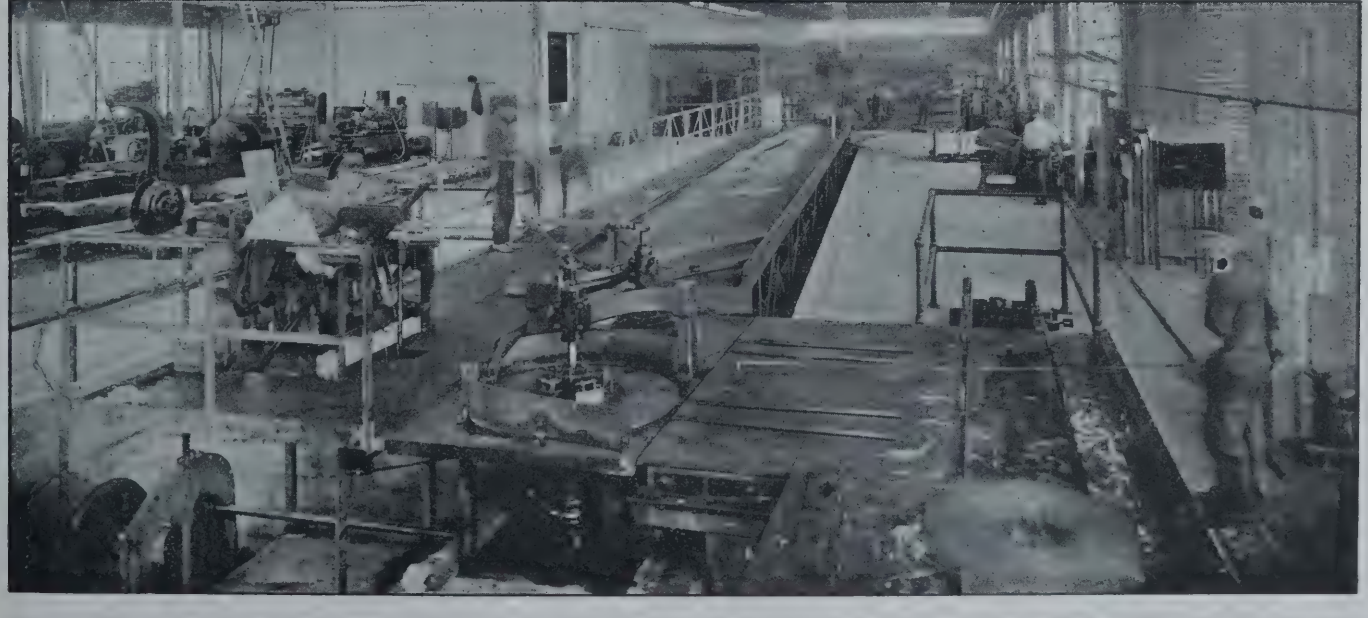

FIG. 1—LOOPS OF HOT-ROLLED STRIP STEEL SLIDE ON THE EDGE TO THE ELECTRICALLY-DRIVEN COILERS FROM WHENCE THEY ARE PULLED ONTO THE CONVEYOR SHOWN AT THE RIGHT. THE CONVEYOR MOVES THE STRIPS SLOWLY THROUGH A MUFFLE-TYPE ANNEALING FURNACE

a 2500-foot strip is handled on a few feet of the conveyor table. This apron-type conveyor moves forward slowly and carries the steel away sufficiently fast to clear a space for the next strip. The forward end of the strip is grasped by means of tongs by a boy and carried to the end of the conveyor where it is clamped to the hub of a coiler which draws the entire piece into a flat coil like a watchspring.

Two coilers, operated independently, are provided. Space is provided for a third. The coiled strips are pulled to one side by a hook where they are caught by the teeth of a conveyor which carries them into a watercooled, semi-airtight muffle conveyor about 250 feet long. The passage of the first eight or 10 coils through this muffle usually exhausts most of the oxygen and gives a neutral atmosphere which greatly reduces the quantity of scale formed on the steel. Emerging from the muffle the coils are cool enough to be banded and handled into cars or storage. The steel is annealed in the muffle until it is unusually soft.

Disposition of Finished Product

From here the coiled strips are piled on corrugated-steel platforms which are picked up by an electric-driven tractor and carried to the storage platforms or direct into cars. From the arrival of the billet in the dock at one end of the building until the coils are loaded into cars at the further end, it is not handled other than mechanically except when being attached to the coiler and when being pulled from the coiler to conveyor.

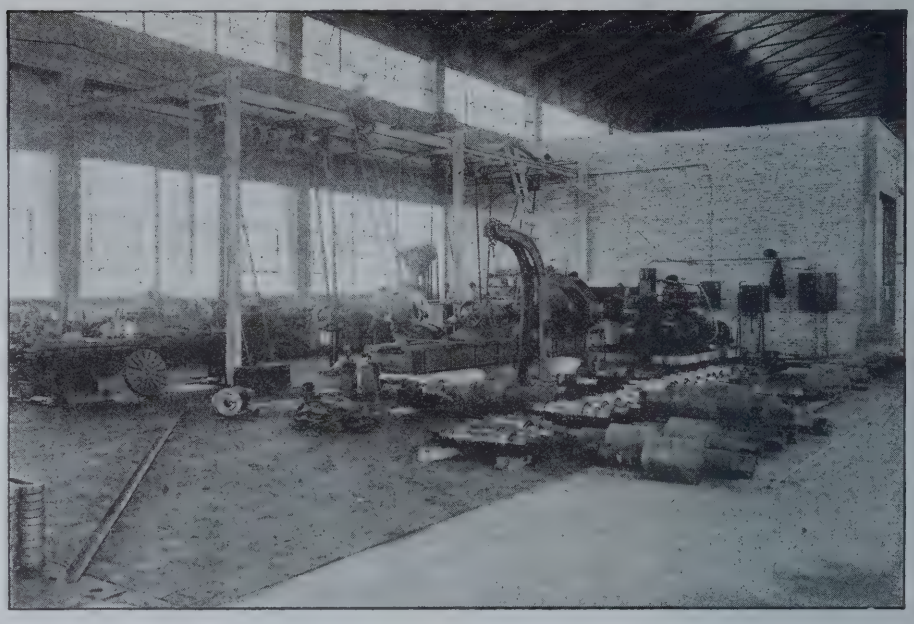

FIG. 3—MACHINE AND ROLL SHOP, WITH WOOD-BLOCK FLOOR AND AMPLE ILLUMINATION. A SMOOTH SURFACE IS IMPARTED TO THE ROLLS BY GRINDING

The banding operation is manual but is accomplished as the coil moves ahead on the conveyor after passing the muffle. The loading track is depressed, the floor of the car being level with the mill floor. By means of this construction the electric tractor carries its load into the car and deposits it where desired.

Aside from solving the problem of handling the swift outpouring of the finished strip, the speed of each successive set of rolls had to be considered. If each succeeding set of rolls was not operated at a rate of speed sufficient to handle the elongated strip as fast as delivered by the preceding set of rolls, then the steel strip would buckle and form a cobble or loop. It was necessary also to avoid establishing a pull by a stand of rolls operating too fast in relation to the preceding, for this action would stretch the steel strip and make it narrow. Much attention was paid to the delicate speed control for each set of rolls.

Uniform Heating is Necessary

Another desideratum was an even heating of the billet to insure accuracy in the finished strip. If hot or cold spots existed in the billet, thicker or thinner sections would result, because the cold portions would resist the pressure of the rolls, while the hotter portions would yield and give thin spots. The furnace, therefore, was

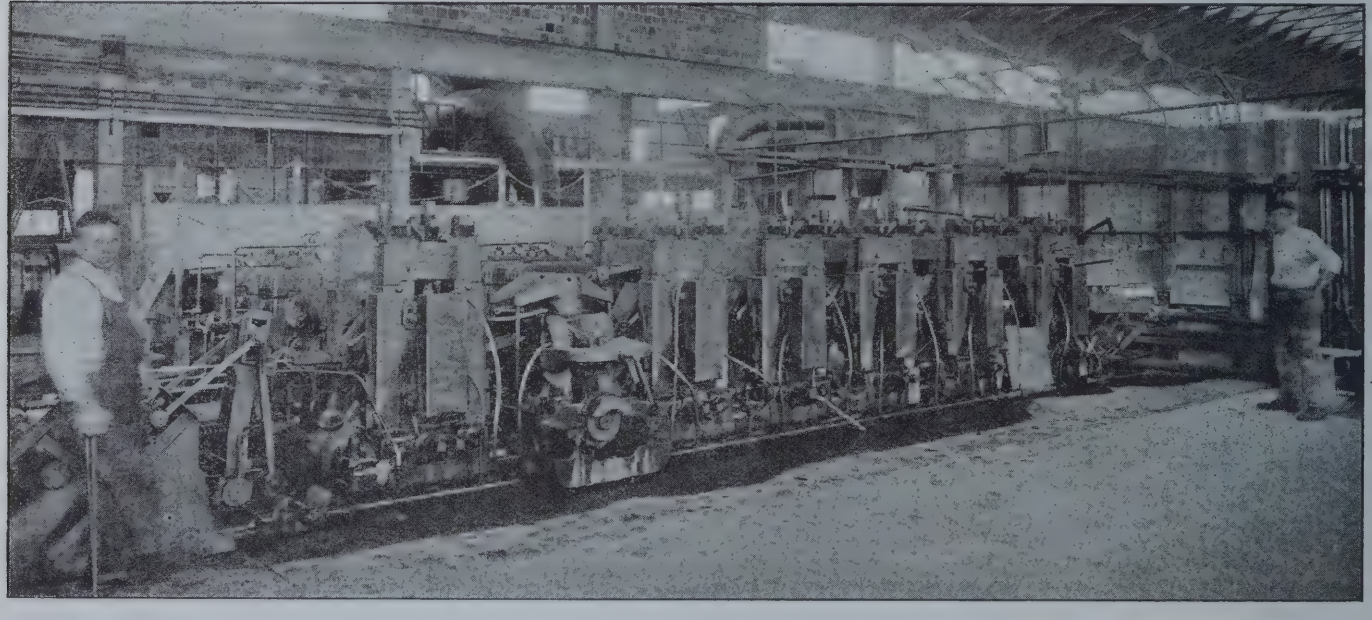

FIG. 2—ROUGHING MILL INCLUDES SIX STANDS OF ROLLS ARRANGED TANDEM. THE FIFTH STAND OF ROLLS GIVES THE EDGING PASS. THE HEATING FURNACE IS SHOWN AT THE RIGHT

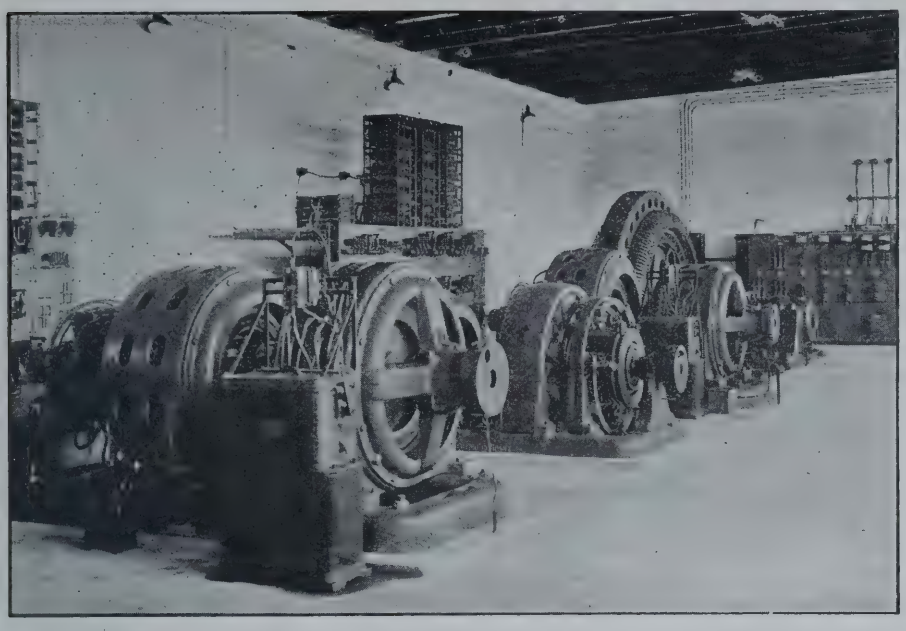

FIG. 4—INTERIOR OF POWER HOUSE SHOWING THE 2000-HORSEPOWER, FINISHING-MILL MOTOR AND AUXILIARY EQUIPMENT

designed to give the maximum of even operation from end to end in order to avoid the slightest difference in temperature over the entire length of the billet.

Range of Specifications

The mill is designed to roll strips from 1 to 3 inches wide and from 0.025 to 0.080 inch thick. The length of the strip depends on the size of the billet and the thickness of the strip. Nothing longer than 2500 feet probably will be attained on this mill from the largest billet rolled to the thinnest strip. The capacity of the mill was rated at 100 to 200 tons per day, varying with the size and gage being rolled. Actual operation has shown a 50 per cent increase over this estimate. The mill site, which consists of 130 acres, has a frontage of more than half a mile on the Calumet river. Three trunk lines pass one boundary. The mill is housed in a reinforced concrete building 85 feet between crane rails, 705 feet long and 25 feet high to the crane rail. Unusual light is supplied through six generous bands of glass in metal sashes, two in each side wall and one in each side of the roof. All floors are cement except that in the roll and machine shop wood blocks are used.

A 15-ton crane with a span of 80 feet, made by the Whiting Foundry Equipment Co., Harvey, Ill., runs the full length of the mill. The crane is used for unloading billets and transfering them to the upper end of the heating furnace in readiness for charging, and for every other service demanded. Billets are delivered on cars inside the mill building thus providing storage under roof and doing away with the necessity of an outside craneway. Rolls, which are used for forming the strips, are turned in the ordinary way in a lathe but all finishing is done by grinding in order to obtain minute accuracy made necessary by the unusually thin section produced. Central station power is delivered at high tension and stepped down by transformers. Extra roll stands, which are completely equipped, are kept in readiness so that in case of an accident they can be set in the mill train. As soon as possible a complete set of duplicate stands will be ready for any emergency.

Fuel for the gas producers is delivered by truck and is dumped into a track hopper. The latter discharges into a crusher, which in turn, discharges into a continuous bucket elevator. This elevator was designed and installed by the Link Belt Co., Chicago. The individual buckets discharge the crushed coal into two bins of 150 tons capacity. These bins are built at the top of the gas-house building in order that the coal can be fed automatically into the producers.

Is Cold Rolled in Three Passes

For more than 30 years the Acme Steel Goods Co. has been producing hot-rolled and cold-rolled strip steel from ¼-inch to 2 inches wide and from 0.01 to 0.07-inch thick, in all

FIG. 5—FINISHING MILL INCLUDES FIVE STANDS OF TWO-HIGH, 10-INCH ROLLS, THE LAST SET OF WHICH OPERATES AT 800 REVOLUTIONS PER MINUTE. THE SECOND EDGING MILL IS SHOWN AT THE EXTREME RIGHT

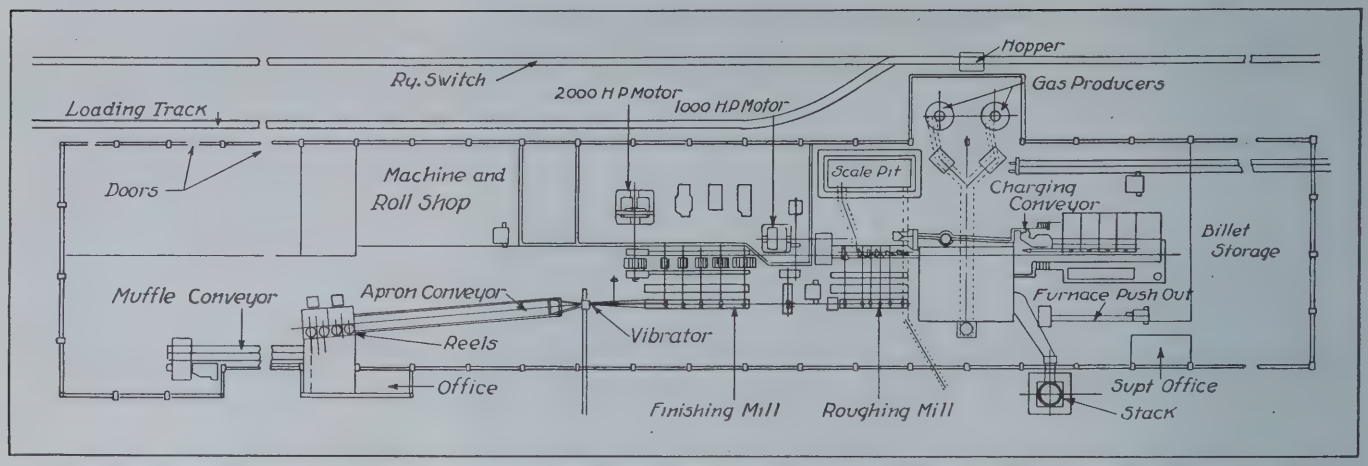

FIG. 6—LAYOUT OF THE ACME STEEL GOODS CO.'S STRIP MILL. BOTH THE ROLLING AND ANNEALING PROCESSES ARE CONTINUOUS

finishes and tempers. Need for longer strips than the market afforded and for a cheaper raw material, caused the present plant to be projected. The steel delivered by the new mill at 0.035-inch thickness is cold rolled to 0.015-inch in three passes. The present output is being absorbed by the company although the officials plan to supply the market also. Charles Traer is general manager of the mill, and W. J. Powner is superintendent. The latter has had extensive experience in the production of wire rods on continuous mills at the Grand Crossing Tack Co. and also in mills at Cleveland and Youngstown, O.

Book Reviews

Commercial Laboratory Notes, by C. L. Petty; leather, 105 pages, 7¼ x 4½ inches; published by the Dayton Metal Products Co. and furnished by THE IRON TRADE REVIEW for $6.

This work is prepared particularly for the use of analytical chemists. The author points out that when called upon to do work along unfamiliar lines the chemist does not have the inclination or the time to look through the available literature pertaining to the subject for the purpose of finding a method to suit his particular needs. The present volume was written to meet this situation.

The book is published in loose leaf form which makes the insertion of new data brought out from time to time a simple matter. Methods for handling many commercial materials in the analytical laboratory are given including many substances classified on the reading of nonferrous alloys, paint, oil, rubber, steel and iron, together with a collection of miscellaneous subjects. The methods indicated were used by the Pennsylvania railroad at Altoona, Pa., and have been slightly modified and extended to make them more comprehensive to the average layman. It is pointed out that the methods given have also stood the test during the world war in the laboratories of the Dayton Metal Products Co., Dayton, O.

Forge Practice and Heat Treatment of Steel, by John Lord Bacon; cloth; 418 pages, 4¾ x 7¼ inches; published by John Wiley & Sons, Inc., and furnished by THE IRON TRADE REVIEW for $1.75.

The art of forging metals is without a doubt one of the most difficult branches of modern manufacturing as the manual operations involved call for a thorough understanding of basic principles, together with skill that is developed only by practice.

In this branch of metal working, it is essential for the beginner to start correctly, otherwise he may find it impossible to develop into a skilled workman. The present volume is now in its third edition, revised and enlarged by Edward R. Markham, a consulting engineer specializing in the heat treatment of steel.

The volume is the outgrowth of a series of notes given to the students at Lewis institute from time to time in connection with shop work of the character under consideration. The author draws attention to the fact that he has not included examples in the book that are not used in everyday shop practice.

The first part of the book is devoted to a description of forges and tools, followed by a concise treatise on welding. Stock calculations, upsetting, bending, etc., follow and simple examples of actual forge work are explained, the author describing each step. Thus the student or apprentice can readily grasp the principles necessary to follow in prosecuting actual work. The chapter on steam hammer work is interesting and explains at length the various classes of forging that are handled advantageously on this tool.

The author next describes tool forging and tempering and gives numerous examples of miscellaneous work. In the chapters devoted to heat treatment, several types of commonly used furnaces are described. The author explains how lathe and planer tools, milling cutters, dies, etc., should be handled in heat treating to give the best results. Numerous mathematical tables are included together with a number of mechanical drawings of typical examples of forge shop work.

The book will be a valuable aid to student, apprentices and practical workmen or foremen and also will serve as a reference book for those who deal with forging and heat-treating problems.

Set National Standards

The council of the German industrial standards committee has agreed to the following conditions becoming standard practice:

1—The uniform temperature of reference for gages, etc., shall be 20 degrees Cent.

2—In view of practical and theoretical advantages, the zero line shall be taken as the limiting line in connection with standard systems of fits.

3—The SI (système international) and Whitworth systems of standard screw thread shall both be considered as standard.

In connection with the third item some industries in Germany are already using the "système international," on the recommendations of the Zurich conference.

Standard specifications have been prepared by the council for drawings, straight pins, standard weights for straight pins, square heads, and taper reamers.—*Stahl und Eisen.*

Must Buy Goods From Germany

British Technical Advisor in Occupied Regions Says One-Sided Trading With Former Enemy is Impossible—Germans Now Selling Rails in Holland Cheaper Than Price Offered by the Allied Countries

BY FRANCIS MILTOUN

French Correspondent of The Iron Trade Review

PARIS, Oct. 21.—The chief technical adviser to the British military governor of Cologne, H. B. Fergusson, set forth in a recent speech some interesting facts concerning the industrial situation in occupied Germany. He said German supremacy in certain manufacturing lines was due largely to the system of "combining capital and pooling knowledge," this being particularly true of the chemical industry. The "give-and-take" bodies for the exchange of information were known under the generic name of Interessengemeinschaft, and while valuable to the various trades, individually and collectively, did not in any way interfere with the executive organization of the various factory members, although they did regulate selling prices, the prices at which raw materials should be acquired and also served as a clearing house for trade secrets.

It is evident, he said, that whoever is to sell goods to Germany must be prepared to buy goods of Germany also; there is no possibility of one-sided trade with an insurmountable barrier over which nothing but cash can climb. Germany has little raw material, and what she has got is not particularly varied. In respect to potash, France has the Germans at a disadvantage and the British have them "tied hand and foot" with respect to dyes.

Rails are being shipped into Holland from Germany at £8 ($38.40) a ton, which is a lower price than either England, France or Belgium can offer. The rate of exchange of the mark is the only thing which tends to make it possible for Germany to send her products abroad; otherwise German competition need not to be feared by England, he declared.

* * *

Increase Production of Electric Steel

Official statistics of the German metallurgical industry show that the production of electric steel in Germany during 1915 amounted to 131,579 tons, in 1916, 190,036, in 1917, 219,700, and in the first ten months of 1918, 221,824. The number of electric steel furnaces in operation during 1918 was 90. The disannexation of Alsace and Lorraine and the occupation of the left bank of the Rhine has brought directly under French control but ten of these electric steel plants, as follows: the Thyssen plant at Hagondange in Lorraine, including two furnaces of eight tons capacity and one of 20 tons capacity; the Rombas plant in Lorraine, with one furnace of two tons capacity; the Roechling steel plant at Voelklingen, in the basin of the Saar, with five furnaces of eight tons capacity, and the Stumm plant at Nuenkirchen, in the basin of the Saar, with one electric furnace.

* * *

Swiss Metal Exchange Organized

A new organization has been created at Zurich, Switzerland, by the Society of Iron and Steel Stockholders to be known as the Bourse Metallurgique. It is to meet each week in the tonhalle of Zurich, the meetings to be open to those connected with the steel and iron and allied industries. The society proposes to invite foreign manufacturers who may be interested as buyers or sellers in Swiss markets.

* * *

Use New Industrial Credit System

The Economic and Industrial Groupment, of St. Etienne, one of the important metal-trade centers of France, in co-operation with a local bank, is organizing a method of extending credit to exporters which goes a step further than the trade acceptance method now so largely in use.

Each order shipped is accepted by a bank, if the customer be known, at a premium based on reports which may be on file as a result of other transactions by other firms. The premium varies from ½ to 5 per cent. The bank pays the shipper upon the turning over of the documents, the premium being in addition to the usual discount charges. If, according to American banking methods this looks like a gamble let it be remembered that the famous Lloyds of London will take almost any kind of a legitimate gamble, even on next season's crops, the end of the war or the end of the world. The system is considered a benefit to the French exporter, and may have to be reckoned with by other nations in dealing with French firms.

* * *

Forge Masters Deny Interference

Defending itself against criticisms which recently have been made concerning its attitude in regard to the metal trades strikes in France the Comité des Forges publicly denies that "as an employers' organization" it is in any way the cause of the conflict between individual employers and their workmen. The employers' organization directly interested is the Groupe of Industrials of the Parisian District, an association distinctly regional, though in its membership are numbers of firms who also are associated with the national committee. In view of the status of the Comité des Forges, and much unjust criticism of its patriotic and self-sacrificing attitude during the war, it is well that its case should be presented. It is the organized, co-operative body of forge masters of France, engaged in solving the big problems of the industry, but it never interferes with matters pertaining solely to labor unrest or issues wherein the interests of the industry as a whole are not involved.

* * *

Italian Firms Increase Capital

The following Italian firms in the metal trades have increased their capital to the amounts stated: Milan—Union of Special Steel Manufacturers, 10,000,000 lire ($2,400,000); Society Bianchi, manufacturing iron and steel, 500,000 lire ($100,000); United Cutlery Works of Castino-Maniago, 3,000,000 lire ($600,000). Rome—Society General, for development of mining and metal industry, from 50,000,000 to 100,000,000 lire ($20,000,000). Turin—F. I. A. T., from 100,000,000 to 200,000,000 lire ($40,000,000). Reggio-Emilia, Italian

machine company, 32,000,000 lire ($6,400,000).

* * *

Italy in Need of Coal

Italy is in great need of coal. By the terms of the peace treaty she is to be granted 100,000 tons per month of coal from the Saar basin. France has granted another 40,000 tons a month. Last year Italy imported 6,400,000 tons of coal, of which 2,000,000 came from France. At present American coal in Italy is more costly than British, but with open market conditions British coal will cost nearly as much as American, a fact which should stimulate the American shipper to greater effort. The Italian government is sending a mission to America to seek sufficient coal to keep Italian industries going during the period of reconstruction and reapportionment of European resources.

Great Britain has promised Italy 750,000 tons a month but now suggests that she may not be able to supply more than 100,000 tons. Coal which England shipped to Marseilles has been diverted from that port and unloaded in Italy, much to the displeasure of the French buyers. England replies that she is doing her best to aid her Italian ally.

At Naples where there was great activity in shipbuilding there is not a pound of coal, and in that region there is no water power. One ship repair station on the Bay of Naples, employing 2000 men, has but one week's coal supply.

* * *

Find Castings Are Faulty

A member of French metallurgical industry comments on the causes which have brought about the high cost of automobile production in England. According to his information, delay in delivery of automobiles, despite the fact that premiums are offered is due to bad cylinder castings, thousands of engines being held up. One manufacturer is reported to have rejected 87 per cent of one lot of gray iron castings while another rejected more than 60 per cent. Both produce high-class cars. Practically all engine manufacturers are having trouble with their castings. It has been suggested that sabotage was the cause, but this explanation must be rejected as many of the faults only come to light at the time of setting up and testing.

As Lloyd George said in parliament only a few days ago: "The effects of the war are far-reaching." One plausible explanation is the difficulty of readjustment of labor to new conditions on top of four years' of strenuous war work by workers who previously were engaged on different processes.

The effect on prices is more apparent than would be supposed. The Crossley, one of Britain's leading cars was priced at $4775 immediately after the war. It was then advanced to $5500, and today is cataloged at $6000, with not a car at the latter price on the road.

The cost of the power unit is sending up the price; that, and the necessity of putting out fully equipped automobiles to compete with the American product.

* * *

Italy's Industries Booming

The manufacturers of machine tools in Italy have held a convention at Milan to protest against the accusation that the Italian industry is not able to supply the demand for the simplest of machine tools, and that their tools, almost without exception, were imported from America, England and Switzerland. It was the mention of Switzerland that caused the protest, for many believe articles of "Swiss manufacture" are German goods.

The syndicate stated that its members were in a position to give "normal satisfaction" to any demands made upon them. The question is simply one of whether or not the present demand is normal. I should say it is not because Italian industries of all kinds are enjoying a degree of prosperity which it never knew before. All of the industries use machine tools.

The recent labor disturbances of Italy seem not to have reduced production to any great extent. Italy's industrial policy provides for the working up of the raw material within her own frontiers. The Italian government is studying the possible effects of liberal importations from Germany, the present abnormal foreign-exchange rates, and the establishment of new tariffs.

* * *

French Obtain Thyssen Plant

From Metz comes the information that details have been decided on which will bring the Thyssen Hagondange plant into control of a French society, the Groupment des Consommateurs de Produits Metallurgique. This is the first after-the-war attempt at a consolidation among consumers to acquire their raw and semifinished material.

At the head of the new organization is the Baron Petiet, president of the Automobile Chamber of Commerce. Among the other automobile firms interested are: Renault, Panhard et Levassor, Aries, Peugeot, Weyher et Richmond, Alsacienne Soc des Constructions Metalliques, Etablissements Dayde, Bessoneau, Lorraine-Dietrich, the Japy group and the Groupment of Iron Founders.

* * *

Luxemburg to Help France

The metallurgical industry of the grand duchy of Luxemburg is henceforth to co-operate with that of France. The die was cast in the last days of September when the people of Luxemburg voted to maintain the reigning dynasty and the Grande Duchesse Charlotte, and to abolish the former economic understanding with Germany in order to throw the weight of their economic force in with that of France.

The ties which naturally, politically and economically, bind Luxemburg to France are manifestly to the detriment of the relations which Belgium hoped for, but the people of Luxemburg were free to choose their working partner. In addition the metallurgical industry of Luxemburg has need of the minerals of Briey, on its southern border.

Luxemburg before the war consumed 8,600,000 tons of iron ore, of which 4,200,000 tons came from Lorraine. Of its own production of 7,500,000 tons 3,000,00 tons were exported to Belgium. Production of pig iron in 1913 amounted to 2,550,000 tons, and steel, 1,336,000 tons.

* * *

Clemenceau Increases Reparation

None of the voyages of observation of Premier Clemenceau since the armistice have been productive of so much encouragement for the business revival of France as that which he completed recently in the iron and steel district of the French Ardennes. Of 400 miles of railroads in the district the Germans left undamaged not more than 30. The bulk of the reconstruction is yet to be done.

Money grants by the government to those whose property was destroyed by the Germans were previously proposed at the rate of 3000 francs each, but on the return of Monsieur Clemenceau this was raised to 20,000. It has taken eight months from the time of the armistice to find that the damage was seven times as great as at first supposed.

* * *

Sweden Buys From Germany

The current Swedish journals announce a signal success for the German steel trade. The management of the Swedish government railroads recently placed orders for a steel railroad bridge to cross a wide arm of the sea near Stockholm. The first and second most favorable bids were from Germany. The first was submitted by a steel works of Augsburg-Nuremburg, and the second by Krupps.

Improving Industrial Management

Scientific Organization for Maximum Production is Considered in Relation to Plant Executives, Workmen and Equipment—Standardization of Duties as Well as of Process is Held to be Important

BY M. H. POTTER

IN THE successful management of an industrial organization the underlying principle of importance is the balancing of production cost, quality, and selling price. It is a well known fact that in the majority of instances it is easy to manufacture, but when selling price and competition are taken into consideration, the problem becomes more complex. Therefore, it is the business of the manager to balance conditions, and to maintain the equilibrium of the organization.

Executive Duties Are Allotted

Fig. 1 illustrated the duties of the organization as related to and governed by the manager. The importance of the functional duties or responsibilities will vary in accordance with the nature of the work, but the general application is identical in all cases. This is the first step in the analysis of management, and serves only as a basis for consideration of details.

Fig. 2 carries the analysis still further, showing the distribution of functions and responsibilities among the various departments. This is an analysis of the underlying principles of plant management, which must receive first consideration if maximum results are to be secured. Here again, the general plan only is illustrated.

Too much consideration cannot be given to processes and operations, and the hiring and handling of labor, to control by means of the standardization of shop operations, the movements of practically every employe.

Organization charts, showing the lines of authority from the general manager to the shop foremen, have their proper place in the handling of an organization, but do not constitute the underlying principles of management. It is only by thorough consideration of the cost of manufacture, quality and selling price that maximum results can be secured. Problems related to lines of authority of various executives will solve themselves, but the allotment of executive duties is another matter. It is this problem that must be solved from the standpoint of practical routine, if the successful results are to be secured.

Standardization is Important

The well-defined rules of efficiency management also have their place, and play their part in increasing production and in maintaining an aggressive, co-operative organization. But the successful manager must go into details when necessity demands, and therefore he must have a system of executive oversight which will permit of prompt and wise decision.

Standardization of duties, and standardization of processes and operations are important to efficient management. By referring to Fig. 4 it

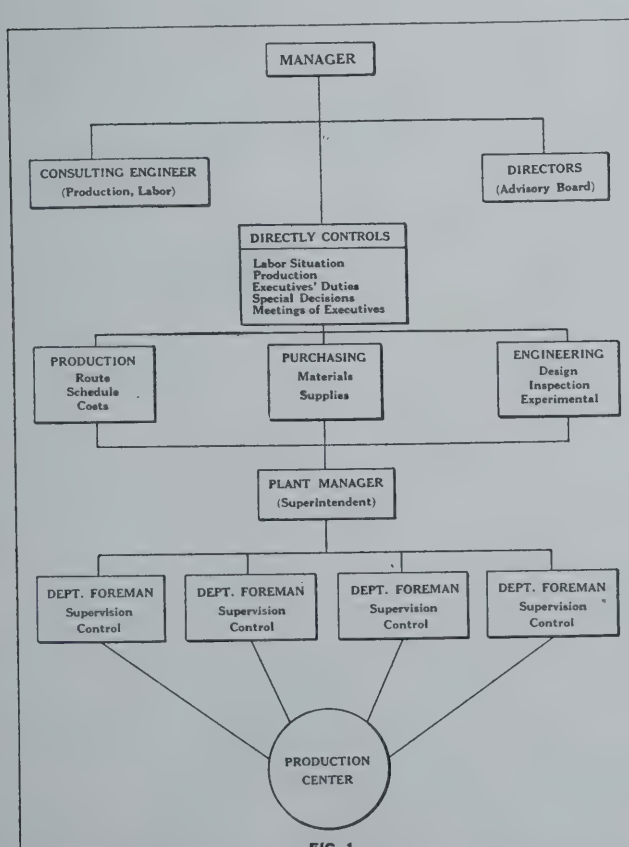

FIG. 1

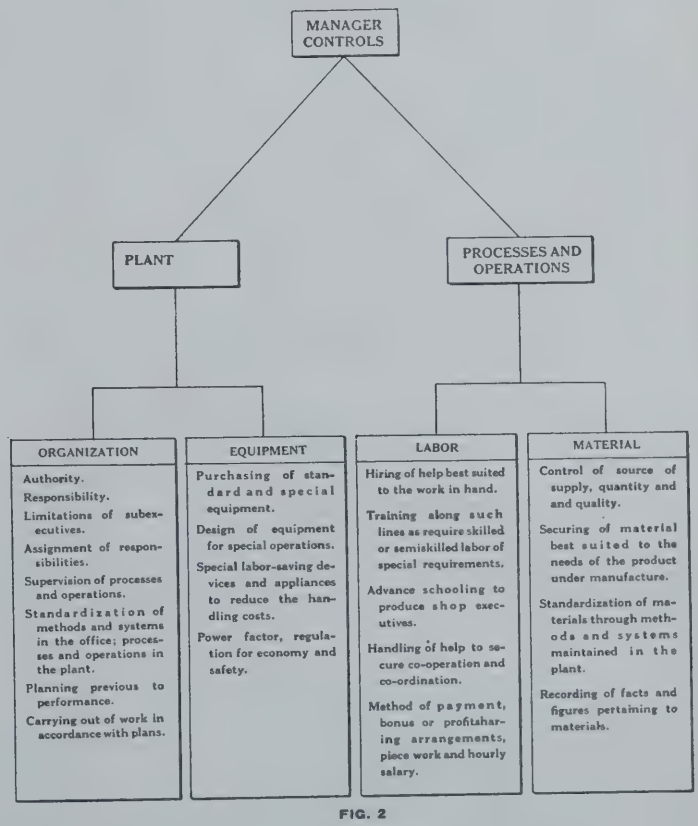

FIG. 2

DUTIES OF ORGANIZATION AS RELATED TO AND GOVERNED BY THE MANAGER

will be noted that it is the desire and function of the manager to outline and maintain definite and fixed duties for the executives and employes under his control. It is through this source of control that a system can be properly handled and that co-operation and co-ordination can be maintained.

Grouping the Duties Desirable

In some lines of industrial work the exact method of determining such standards will vary. For instance, it may be desirable to group the duties by departments, or on the other hand it may facilitate control to decide authority along other lines.

In undertaking to establish a method of control to assist in efficient management, it is necessary to secure information from the executives in charge of various operations in particular groups or departments. The executive in charge of each group will in turn secure the greater part of the desired information from the subexecutives or clerks. It is important that the views of the one performing the various duties be taken as a basis upon which the manager is to compile and allot the duties which will govern the functioning of the organization under a form of standardization. A manual should be prepared as a guide, and used to enforce the lines of duties as established. Too much thought cannot be devoted to this important feature of plant management.

Duplication of Work Prevented

The proper division of duties is most important, and will relieve the executives and higher salaried employes of routine. Furthermore it will limit the field of action of employes, and permit of centralization of duty, which is an important factor in scientific management. In larger organizations, such a method of control will prevent duplication of work, and will greatly assist in the simplification of the system employed by eliminating unnecessary forms and blanks for planning, stock control, routing, scheduling, cost keeping and production. It will permit of the recording of only such facts and figures which are of actual value to the manager.

Departments Must Co-Operate

Standardization of processes and operations is another valuable aid to efficient management, provided it is not carried to extremes. Fig. 5 illustrates the important details which come under this subject. The successful operation of this branch of standardization begins with the planning department and is expanded in the engineering and production departments. There are instances, due to shop equipment and other reasons, when the routing and scheduling departments must co-operate in this matter, in order to maintain the balanced use of equipment in the shop. This is especially important in plants whose equipment is always in maximum operation, when an error in routing and scheduling of work may cause congestion.

Fig. 6 shows an outline of organization functions, representing further development in efficient, economical management. The system is based entirely upon results of endeavors to organize for maximum efficiency all executives under control of the manager.

Efficient Control Necessary

It is reasonable to expect only maximum results from the workmen in the shop when conditions are so prearranged as to secure maximum efficiency of the executives in charge. It is through efficient control of all subexecutives and foremen that the

WHILE attention has been focused on employment problems and modern ideas in regard to the management of men, an important feature of industrial management has been overlooked, at least in some establishments where there is a tendency to permit employes to share in management. Regardless of whether a plant is operated on old established lines, or whether new theories of employe participation are tried out, the centralization of authority and responsibility must remain as the foundation stone of successful management.

In this article which is the first of a series on industrial management written for THE IRON TRADE REVIEW, *the author, M. H. Potter, has analyzed factors of successful management, and presents an outline for organization of executive and plant forces in relation to various duties to obtain maximum results. The series is of special interest to plant executives and foremen. The next article which will be published in the near future will deal with manufacturing standards and their advantages.*

STANDARDIZATION OF ORGANIZATION AND OPERATIONS

manager must work for efficiency and quality in output, and a satisfied, earnest working force.

Install Electric Furnaces in Norway

Electrical equipment for 20 electric furnaces which, when placed in operation, will comprise what is said to be the largest electric furnace installation ever made, is now being shipped from the United States to the Glomfjord Smeltverk Co., Glomfjord, Norway.

Each of the 20 units includes a 1300-kilovolt-ampere single-phase main power transformer; a 26.2-kilovolt-ampere series transformer; a 26.2-kilovolt-ampere induction regulator; an automatic selector switch; a transformer switch; and a two-panel, separately-mounted switchboard for the control of the electrical apparatus. The oil for insulating and cooling the transformers and regulators amounted to 16,200 gallons.

Heat regulation of each furnace is accomplished by changing voltage taps on the high-voltage winding of the main power transformer. Switches and induction regulators operate together to automatically change connections on the high-tension winding and to provide voltage control on each step. The apparatus was made by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

Mexican Oil Industry

Mexico, it is said, is in the way to become the most important oil-producing country in the world. In spite of much labor unrest, it has reached the second place, being inferior only to the United States. In seven years the production increased from 3,630,000 barrels in 1910 to 55,300,000 barrels in 1917. This is far behind the United States but Mexico is only at the beginning of its production. It is estimated that when the 300 and more borings now in progress have reached completion as working wells, the output will amount to 500,000,000 barrels a year. Only 25 wells were in operation in 1917. The development of the industry is at present seriously hindered by difficulties of transport. The greater portion of the exports go to the United States, Great Britain being the next important customer. Now that the war has ended, a great development of the Mexican oil export trade may be expected, for all European countries are short of oil. Mexico seems destined to play an important part in the world's industries in the future. (*Prometheus; Allgemeinen Oesterreichische Chemiker-und-Techniker-Zeitung.*)

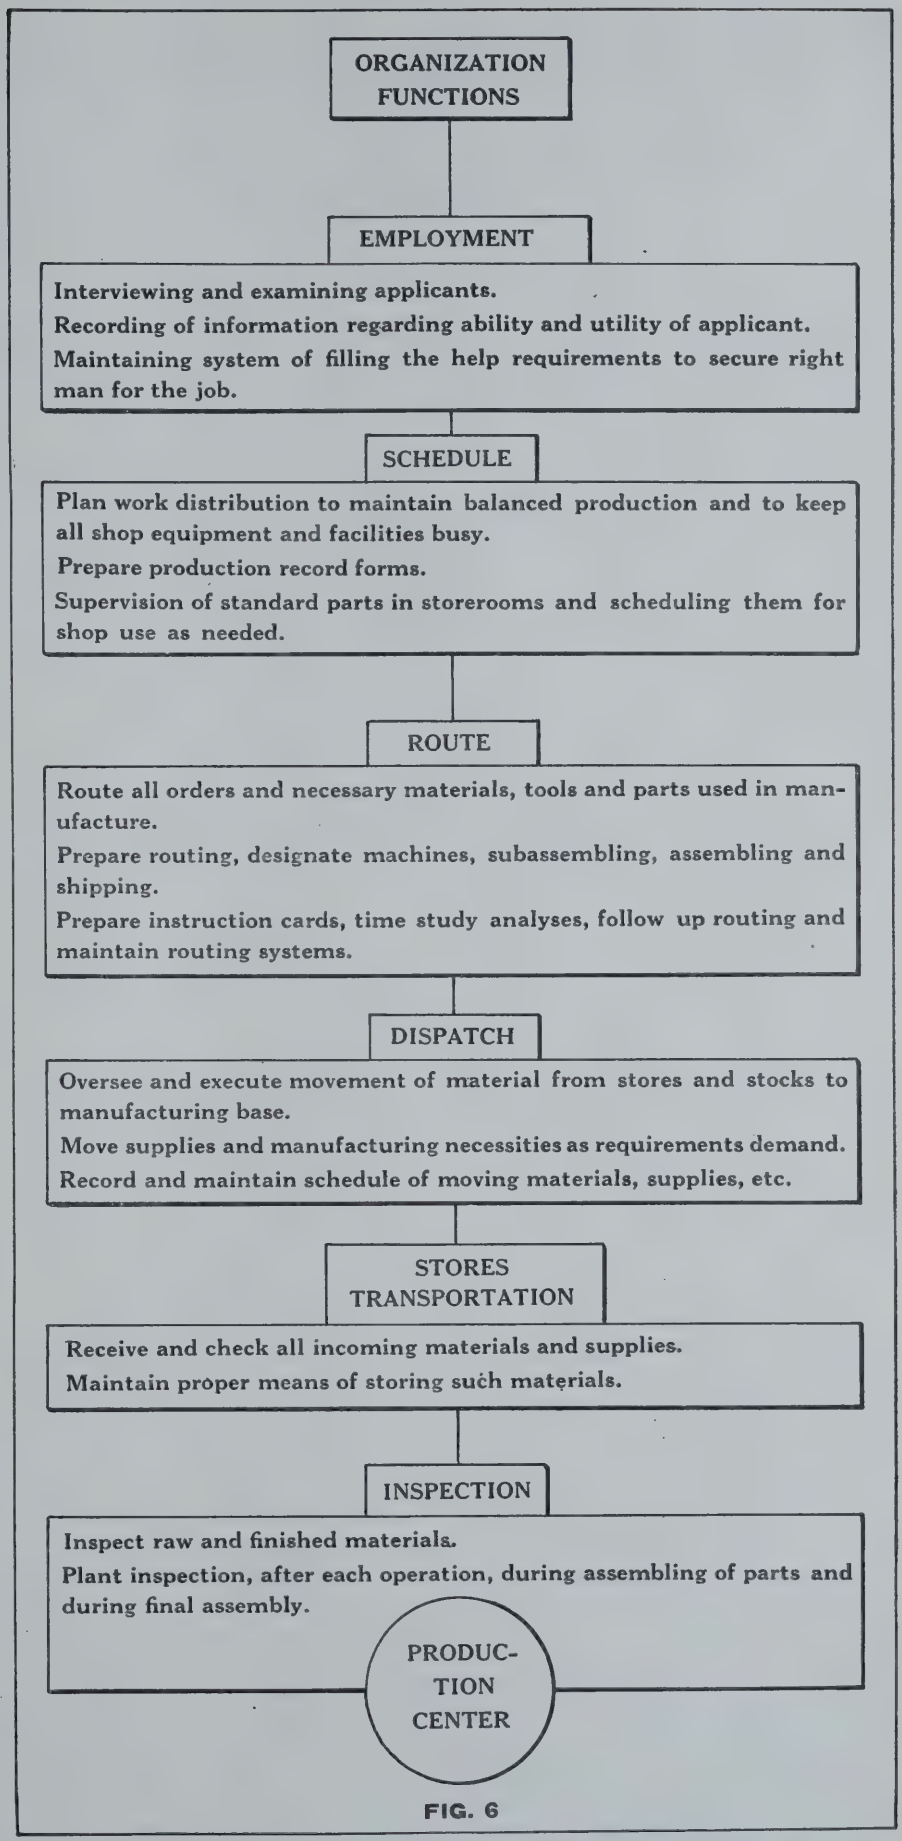

FIG. 6

OUTLINE OF AN INDUSTRIAL ORGANIZATION WHICH REPRESENTS A HIGH DEVELOPMENT IN EFFICIENT AND ECONOMICAL MANAGEMENT. THE BASIS OF THE SYSTEM IS THAT OF ORGANIZING EFFICIENTLY ALL EXECUTIVES UNDER CONTROL OF THE MANAGER

Making the Toolroom Efficient

Economical Tool Room Practice Depends on Two Principal Factors: Installing Up-to-Date Equipment and Routing Work so That Lower Priced Workmen Perform the Simple Operations

BY F. B. JACOBS

TOOLMAKING departments for making jigs, dies, fixtures and other special tools date from the time about 30 years ago when sewing machine and arms manufacturers began to have enough of this class of work to keep a force of toolmakers engaged constantly. Prior to that time, every all-around machinist was a toolmaker. With the steady march of progress, however, the all-around machinist is becoming extinct while the present day toolmaker serves as the nearest approach to the all around man, that is, a workman who is competent to handle a lathe, planer, milling machine, universal grinder, etc.

Toolmaking is a comparatively expensive branch of present-day manufacturing, due to the fact that competent toolroom men command high wages. Moreover, the machine and small-tool equipment of the toolroom is an expensive factor in itself. While indifferently made tools may be satisfactory for the general run of machine work, this is not true of tools to be used in the toolroom. Machine tools for this work must be as accurate as it is possible to produce them, otherwise unnecessary labor is consumed in bringing the finished product up to a satisfactory standard of finish.
